The Secretary of War was authorized and directed by the provisions of an act to authorize the President to increase temporarily the Military Establishment of the United States, approved, May 18, 1917, to do during the present war everything he might deem necessary to suppress and prevent the keeping or setting up of houses of ill fame, brothels, or bawdy houses in proximity to military stations, and certain penalties were prescribed for the violation of such rules as the Secretary might promulgate to carry into effect the provisions of the act. It has been found necessary, however, to seek further legislation on the subject, and by a bill passed by the United States Senate on May 17, it is provided that during the present emergency it shall be unlawful, within such distance of any military establishment as the Secretary of War shall determine to be needful, to engage in prostitution, or to aid or abet prostitution, or to procure or solicit for purposes of prostitution; or to keep or set up a house of ill fame, or bawdy house; or to receive any person for purposes of lewdness, assignation, or prostitution into any vehicle, conveyance, place, structure, or building, or to permit any person to remain for purposes of prostitution in any conveyance, place, structure, or building. Punishment for violation of this law is by a fine of not more than $1,000, or by imprisonment for not more than one year, or by both; and persons subject to military law may be punished as provided in the Articles of War. This bill now goes to the House of Representatives for consideration.

Personnel of the Medical Department

For the week ending May 31, 1918, the personnel of the Medical Department of the Army included:

Medical Corps: 868, including 1 major-general, 65 colonels, 110 lieutenant-colonels, 298 majors and 394 lieutenants.

Medical Reserve Corps: 19,226, including 1,388 majors, 4,983 captains and 12,855 lieutenants. On active duty: 17,343, including 1,320 majors, 4,727 captains and 11,296 lieutenants.

Medical Corps, National Guard: 1,199, including 18 lieutenant-colonels, 249 majors, 150 captains and 782 lieutenants.

Medical Corps, National Army: 151, including 5 brigadier-generals, 16 colonels, 122 lieutenant-colonels and 8 majors.

The discharges to date are:

	Number	
Causes	M.R.C.	M.C.N.G.
Physical disability	670	52
Inaptitude	262	20
Other branches of service	209	72
Resignations	132	33
Domestic troubles	59	0
Needed by community	50	0
Deaths	80	5
Dismissals	10	3
Duty completed	1	0
No reasons given	14	0
	1,767	185

New Army Appropriations

In the new Army appropriation bill, reported by the House Committee on Military Affairs on May 25, the amount indicated for the medical and hospital department of the Army is $267,408,948. In addition there is included for construction and repair of hospitals, $60,000,000; for hospital care in the Canal Zone, $60,000; for the Army Medical museum and Library, $25,000. Among the large items in the bill are those for pay of the Army, $1,587,318,495.14; for transportation of the Army and supplies, $1,532,606,103, and for clothing and camp garrison equipage, $1,230,190,089.

Federal Control of Venereal Diseases Proposed

Action by the United States government to prevent the spread of venereal diseases is proposed in two bills recently introduced into Congress, going far beyond anything heretofore contemplated. Both bills are carefully drawn and bear internal evidence of being the results of careful studies of the situation in so far as concerns the possibilities of federal control. One bill proposes direct action by the Treasury Department, through the United States Public Health Service. The other provides for the creation of an Interdepartmental Social Hygiene Board, to operate primarily through subsidies granted by it to state boards and departments of health, and to universities, colleges, and other suitable institutions.

The bill proposing direct action through the Treasury Department, operating through the Bureau of Public Health, creates in that bureau a division of public health, under direction of an assistant Surgeon-General, and imposes on the bureau the following duties:

(*a*) To study, investigate and conduct research work into the cause, prevention and treatment of venereal diseases; (*b*) to construct, acquire, purchase, lease or otherwise obtain internment hospitals, and to equip, manage, conduct and operate the same; (*c*) to administer and apply medical treatment to persons afflicted with venereal diseases while in said internment hospitals, and to issue orders or discharge therefrom upon cure; (*d*) to cause the arrest and prosecution of immoral persons afflicted with venereal diseases who go or attempt to go from one state, district or insular possession of the United States to another, and to cause the arrest and prosecution of persons who aid, assist or connive at the same; (*e*) to receive at such internment hospitals and to have authority and custody thereof for the purpose of examination or medical observation or treatment, all immoral persons afflicted or thought to be afflicted with venereal diseases, who are delivered to or turned over to the officer in charge of any such internment hospital by any state, county, city or town board of health or health department, or by any civil or military court, sheriff, police or peace officer, or by the military or naval authorities of the United States; (*f*) to detain for purposes of medical observation or examination and treatment any immoral person going or attempting to go from one political division to another, and to commit any such person afflicted with venereal disease to an internment hospital, and to administer medical treatment to such person, and to have custody of him; and (*g*) to cooperate with state, county, city and town boards or departments of health in the prevention and treatment and cure of venereal diseases, and to prevent the spread thereof.

The bill makes it unlawful for any immoral person afflicted with syphilis, gonorrhea, chancroid or other venereal disease capable of being communicated from one person to another to go or attempt to go from one state, district or insular possession of the United States to another, and provides a penalty of a fine not less than $500 nor more than $1,000, or imprisonment for not less than six months nor more than one year, or by both fine and imprisonment. The term "immoral person" is defined to include any bawd, prostitute or female who practices sexual intercourse out of wedlock for or without hire or thing of value; or any man who consorts with, associates or companions with any immoral woman, or who loiters about or frequents any bawdy house or brothel, or any bawd or any lewd or licentious person.

The second of the bills referred to above creates a board to be known as the Interdepartmental Social Hygiene Board, to consist of the Secretary of War, the Secretary of the Navy, and the Secretary of the Treasury, "as ex officio members," and of the Surgeon-General of the Army, the Surgeon-General of the Navy, and the Surgeon-General of the Public Health Service, or of persons whom the secretaries of the Army, the Navy, and the Treasury may respectively designate; and it empowers the board

(*a*) To recommend rules and regulations for the expenditure of moneys allotted to the states under authority of the act; (*b*) to select institutions and to fix allotments to each institution to whom money may be allotted under the act; and (*c*) to recommend to the Secretary of the Treasury, the Secretary of War and the Secretary of the Navy such general measures as will promote correlation and efficiency in carrying out the purposes of the act by their respective departments. To carry out the provisions of the act recited above, "to be expended under the joint directions of the Secretary of War and the Secretary of the Navy," an appropriation of one million dollars is recommended, to be in addition to other appropriations made by the respective states, and in addition to funds received from any other sources of a more general character. An additional million dollars is recommended to be paid to the states for the use of their respective boards or departments of health in the prevention, treatment and control of venereal diseases, to be allotted to the states in accordance with the rules and regulations prescribed by the Secretary of the Treasury, allotments after the year ending June 30, 1919, to be conditioned upon the appropriation of like amounts by the states. An appropriation of one hundred thousand dollars is called for, to be paid to such universities, colleges or other suitable institutions as in the judgment of the Interdepartmental Social Hygiene Board are qualified for scientific research for the purpose of discovering more effective medical measures for the prevention and treatment of venereal diseases; and an additional appropriation of three hundred thousand dollars is proposed, to be paid to similar institutions, for the purpose of discovering and developing more effective educational measures in the prevention of venereal diseases and for the purpose of sociologic and psychologic research related thereto.

Both bills have been referred to appropriate committees.

Nonphysical Standards for Flyers

Asserting that the establishment of a difficult and inelastic schedule of physical requirements for candidates for the aviation service is wrong in principle and has deprived the service of many good flyers, Parsons in the *U. S. Naval Bulletin* (April, 1918) gives an account of tests now applied in the selection of aviators which tend toward the establishment of what he calls "nonphysical standards." He says that formerly "We thought that to become a successful aeronaut was something that could be attained by the one in a thousand, the true hero, endowed with almost miraculous skill and daring. It was because this view was generally held, perhaps, that we adopted such a high set of physical standards in our selection of aviation candidates." Experience has taught that almost any young man with a reasonable amount of common sense, the usual amount of "nerve" possessed by most young Americans, and a keen desire to be an aviator, can become a good flyer in a very few hours. It is questionable, he says, whether a great deal more actual skill is required in learning to fly than in learning to drive an automobile. The most important qualities are "nerve" and lack of fear of the air. Good physical health is of course desirable, but he calls attention to the absurdity of rejecting men, as has been done in instances which he mentions, for lacking a quarter inch of the scheduled figure in chest expansion, or for having flat feet, which he does not use for air navigation purposes, or for being slightly deaf, when the roar of the plane engines while in the air makes it impossible for one with the most acute hearing to hear anything else. The Navy has already rejected hundreds of applicants because of trivial minor defects, most of whom, it is believed, could become successful aviators. In fact, many of them were accepted in the Canadian Royal Flying Corps where they have made good.

Many cases of "perfect health" men cannot learn to fly, and many cases of "not perfect health" men have become famous flyers, so that mere physical standards are far from infallible. It requires "something else" to make a flyer, and in determining what that is flight instructors have been appealed to. While it is difficult to determine and cannot be determined definitely what that "something else" is, the instructors after discussion have unanimously agreed that a flyer should be cool under strain, be dependable at the critical moment, be mentally and physically alert, lack any inherent fear of the air, and be persistent and persevering in the ambition to become a successful aviator. It is also believed that he should be intelligent, athletic and endowed with good muscular coordination, possessed of a keen sense of equilibrium and be a good judge of velocity and distances. There was no agreement as to whether extreme stolidity or great nervous energy was preferable in an aviator, expertness being found in both temperamental classes. Purely physical qualifications were not given much weight, even the question of exceptional vision. Whereas one naval examiner was much troubled because a candidate had vision of 16/20 in one eye, it is known that one of the greatest British flyers has but 4/20 vision (uncorrected) in one eye and not a great deal more in the other. The instructors were all agreed that a skilful motorcyclist or automobile driver always makes a good aviator. Parsons describes in more or less detail tests devised by Drs. L. E. Troland and H. E. Burtt of Harvard Psychological Laboratory for testing candidates for aviation as to "coolness," alertness, muscular coordination, judgments of distances, powers of observation, unusual fear of flying, equilibrium reaction time, intelligence, etc.

For Vocational Rehabilitation of Soldiers and Sailors

Senator Hoke Smith's bill for the vocational rehabilitation of soldiers and sailors has passed the Senate without a dissenting vote, after some amendments desired by the Surgeon-General. It is now in the House. As it passed the Senate the bill provides that every person who is disabled under circumstances entitling him after discharge from the military or naval forces to compensation under the War Risk Insurance law, and who after his discharge, in the opinion of a board created for the purpose, is unable to carry on a gainful occupation, or to resume his former occupation, or to enter on some other occupation successfully, shall, when feasible, be furnished a course in vocational rehabilitation as prescribed by the board. The disabled person during the time of his rehabilitation and instruction will be paid monthly an amount equal to the amount of his last pay while in active service. Instruction is to be made available without cost. Section 4 relates to the powers of the board in preparing and equipping itself for such instruction and carrying on the courses, and for making all regulations, etc., necessary for the proper carrying out of the purposes of the bill. Section 5 relates to the duty of the board to make studies, investigations and reports regarding vocational rehabilitation and the placement of persons rehabilitated in suitable gainful occupations, which studies, investigations and reports and their carrying out may be done and made in cooperation with other departments and bureaus of the government or with such other public and private agencies as may be deemed advisable.

Section 6 provides that all medical and surgical or other work or treatment necessary to give functional and mental restoration to disabled persons prior to their discharge from the naval or military forces shall be under the control of the War Department and the Navy Department, respectively. After the men are discharged from the military or naval service the training will be under the Federal Board for Vocational Education. This board already starts and has in its personnel the secretaries of commerce, labor and agriculture and the commissioner of education, with three additional men not in official position. The War and Navy Departments are to continue to act in an advisory capacity to the board, and while still in the service the soldiers and sailors will be under the authority of the War and Navy Departments, and the Surgeon-General may deal with them, in his attempt to cure them from their disabilities, without interference from any one.

Section 7 empowers the board to receive gifts and donations from public or private sources which shall be paid into the treasury to constitute a special fund to carry out the purposes of the act. Section 8 provides for appropriations to carry out the purposes of the bill and the manner in which the appropriations shall be apportioned to those purposes.

DISEASE CONDITIONS AMONG TROOPS IN THE UNITED STATES

From Telegraphic Reports Received in the Office of the Surgeon-General for the Week Ending May 24, 1918

1. ANNUAL ADMISSION RATE PER 1,000 (disease only):

		Last Week
All Troops	1,068.1	1,106.2
Divisional Camps	764.5	736.
Cantonments	1,200.9	1,227.2
Departmental and Other Troops	1,109.1	1,177.3

2. NONEFFECTIVE RATE PER 1,000 ON DAY REPORT:

All Troops	39.8	39.5
Divisional Camps	33.4	33.
Cantonments	46.4	44.7
Departmental and Other Troops	35.8	38.4

3. ANNUAL DEATH RATE PER 1,000 (disease only):

All Troops	5.7	6.3
Divisional Camps	1.9	3.1
Cantonments	9.0	9.9
Departmental and Other Troops	4.1	4.2

ORDERS TO OFFICERS OF THE MEDICAL CORPS AND OF THE MEDICAL CORPS OF THE NATIONAL ARMY

To Camp Bowie, Fort Worth, Tex., as assistant to camp surgeon, from Camp Sherman, Major JOHN A. BURKET.

To Camp Crane, Allentown, Pa., for duty, from the Surgeon-General's Office, Major STEPHEN H. SMITH; from Walter Reed General Hospital, Major EDGAR A. BOCOCK, Lieut. PAUL E. McNABB.

To Camp Custer, Battle Creek, Mich., as assistant to camp surgeon, from Biltmore, Major EDWARD A. NOYES.

To Camp Devens, Ayer, Mass., for sanitary inspection, and on completion *to his proper station*, Col. HOWARD DEANE C. HOWARD. Base hospital, from the Surgeon-General's Office, Lieut.-Col. LEARTUS J. OWEN. As assistant to camp surgeon, from Fort McHenry, Major HARRY R. BEERY.

To Camp Lee, Petersburg, Va., for sanitary inspection, and on completion *to his proper station*, Col. ALBERT H. TRUBY. *To Camp Lee*, Petersburg, Va., *Camp Wadsworth*, Spartanburg, and *Camp Sevier*, Greenville, S. C., *Camp Gordon*, Atlanta, *Camp Wheeler*, Macon, and *Camp Hancock*, Augusta, Ga., for duty, and on completion *to his proper station*, Lieut.-Col. EARL H. BRANS.

To Camp Meade, Annapolis Junction, Md., for temporary duty, from Camp Wheeler, Lieut.-Col. GEORGE F. KEENAN.

To Camp Pike, Little Rock, Ark., as assistant to the camp surgeon, from Columbus Barracks, Major GEORGE D. CHUNN.

To Camp Sherman, Chillicothe, Ohio, for temporary duty, from Camp Dix, Lieut.-Col. SAMUEL S. CREIGHTON. *To Camp Sherman*, Chillicothe, Ohio, *Camp Zachary Taylor*, Louisville, Ky., *Camp McClellan*, Anniston, and *Camp Sheridan*, Montgomery, Ala., *Camp Gordon*, Atlanta, *Camp Wheeler*, Macon, and *Camp Hancock*, Augusta, Ga., *Camp Sevier*, Greenville, and *Camp Wadsworth*, Spartanburg, S. C., for sanitary inspection, and on completion *to his proper station*, Lieut.-Col. FRANK W. WEED.

To Camp Travis, Fort Sam Houston, *Camp Bowie*, Fort Worth, *Camp MacArthur*, Waco, and *Camp Logan*, Houston, Tex., *Camp Beauregard*, Alexandria, La., and *Camp Shelby*, Hattiesburg, Miss., for sanitary inspection, and on completion *to his proper station*, from Fort Sam Houston, Col. WILLIAM F. LEWIS.

To Camp Wadsworth, Spartanburg, S. C., for duty, from Camp Sevier, Lieut.-Col. CONDON C. McCORNACK.

To Camp Zachary Taylor, Louisville, Ky., as assistant to camp surgeon, from Columbus Barracks, Major HARRY L. ARNOLD.

To Cape May, N. J., for duty, and on completion *to his proper station*, Col. WALTER R. PARKER.

To Chicago, Ill., Presbyterian Hospital, for instruction, and on completion *to his proper station*, from Camp Custer, Lieut. JOHN E. KILEY; from Camp Dodge, Lieut. GEORGE W. SNYDER; from Camp Grant, Lieut. ALLEN R. HOWARD.

To Fort Leavenworth, Kansas, for duty, from Army Medical School, Lieut. WILLIAM S. McCANN.

To Fort Oglethorpe for duty, and on completion *to his proper station*, Col. CLAUDE K. MORGAN.

To Mineola, L. I., N. Y., for duty, and on completion *to his proper station*, Col. THEODORE C. LYSTER.

To New Haven, Conn., for duty, and on completion *to Washington, D. C.*, Lieut.-Col. CHARLES F. CRAIG.

To New Orleans, La., Charity Hospital, for instruction, and on completion *to their proper stations* from Camp Shelby, Capts. DAVID L. HILL, DON McCLELLAND, OTIS McQUOWN, Lieuts. FRED E. HICKSON, DORSEY M. HINES, RODNEY N. TROUTMAN, ALLEN H. WALKER, ADRIAL C. WEAKLEY.

To New York City, for duty, and on completion *to his proper station*, Lieut.-Col. JAMES BORDLEY. Bellevue Hospital, for instruction, and on completion *to his proper station*, from Camp Meade, Lieuts. CEDRIC E. FILKINS, ROY T. HASKELL, JOHN C. WOODLAND; from Camp Sheridan Capt. MORSE F. OSBORN, Lieuts. FRED L. EYESTONE, GUY G. GIFFEN, MATHEW C. HUUTER, EDWARD J. KENNEDY, P. C. PENNINGTON, EDWARD E. SMITH, FOR-REST R. STEWART; from Camp Wheeler, Majors CORNELIUS F. HOLTON, WILLIAM C. MILES, Capt. ROBERT B. BEARD.

To Philadelphia, Pa., for duty, and on completion *to his proper station*, Col. REUBEN B. MILLER.

To Pittsburgh, Pa., Carnegie Bldg., for instruction and on completion *to their proper stations* from Camp Beauregard, Lieuts. RECTOR P. SHEETS, ASA C. WATSON.

To Plattsburg Barracks, N. Y., for inspection, and on completion *to his proper station*, from Fort Porter, Lieut.-Col. THOMAS D. WOODSON.

To Rockefeller Institute for duty, and on completion *to Washington, D. C.*, Major CARRALL G. BULL.

The following order has been revoked: *To Edgewood, Md.*, as camp surgeon, from San Francisco, Major LEO C. MUDD.

ORDERS TO OFFICERS OF MEDICAL RESERVE CORPS

Alabama

To Camp A. A. Humphreys, Accotink, Va., for duty, and on completion *to Camp Meade*, Lieut. BURTON F. AUSTIN, Mobile.

To Camp Crane, Allentown, Pa., base hospital, from Fort Logan, H. Roots, Lieut. CLAUDE C. McCLEAN, Birmingham.

To Camp Hancock, Augusta, Ga., base hospital, Capt. WILLIAM G. THIGPEN, Montgomery.

To Camp Jackson, Columbia, S. C., base hospital, Lieut. JOHN D. DURDEN, Montgomery.

To Camp Lee, Petersburg, Va., with the board examining the troops for cardiovascular diseases, from Fort Oglethorpe, Lieut. JOSEPH W. HUGHES, Birmingham.

To Camp Meade, Annapolis Junction, Md., base hospital, Lieut. MERCER HOWE, Elba.

To Camp Pike, Little Rock, Ark., as a member of the board examining the command for tuberculosis, from Fort Riley, Lieut. LLEWELLYN H. LEDBETTER, Goodwater.

To Fort Oglethorpe for instruction, Capt. E. LAURENCE SCOTT, Greenville.

To Hoboken, N. J., for duty, from Camp Dix, Capt., GEORGE C. KILPATRICK, Bayou Labatre.

To New Orleans, La., Charity Hospital, for instruction, and on completion *to his proper station*, from Camp Pike, Lieut. SOLON W. WRIGHT, Bessemer.

To Pittsburgh, Pa., Carnegie Institute of Technology, for instruction, and on completion *to his proper station*, from Fort Oglethorpe, Lieut. HENRY G. WADDELL, Dadeville.

To Riverside, Calif., Signal Corps Aviation School, for duty, from Arcadia, Lieut. GUY E. STEWART, Attalla.

Arizona

To Fort Des Moines, Ia., base hospital, Capts. ALBERT L. GUSTETTER, Nogales; JOEL L. BUTLER, Tuscon.

To Fort Riley for instruction, Lieut. CHARLES L. HATHAWAY, Winslow.

To Lake Charles, La., S. C. A. School, for duty, Capt. EDWARD W. ADAMSON, Douglas.

To report by wire to the commanding general, Southern Department, for duty, Lieut. RICHARD McC. FRANCIS, Williams.

Arkansas

JAMES A. HILL, Houston, Lieut. CHARLES E. COLLINS, Alvin.

To Otisville, N. Y., for duty, from New Haven, Lieut. IVY STANSELL, Sanderson.

To report to the commanding general, Southern Department, for assignment to duty, Lieut. BASCOM LYNN, San Angelo; from Fort Sam Houston, Capt. FRANK L. PASCHAL, San Antonio.

To Richmond, Va., Richmond School Board, to make physical examinations and give medical attention to the drafted men enrolled at this institution, and on completion *to his proper station*, from Camp Lee, Lieut. WALTER L. JACKSON, Dallas.

To Rockefeller Institute for instruction in the treatment of infected wounds and on completion *to Camp Meade*, Annapolis Junction, Md., base hospital, Capt. EDWIN B. KENNER, Galveston. On completion *to Cape May, N. J.*, for duty, from New York City, Lieut. JOHN E. QUAY, Waco.

To Sacramento, Cal., Signal Corps Aviation School for duty, from Waco, Lieut. Y. FRANK HOPKINS, Thrall.

To San Antonio, Texas, for duty, from Houston, Capt. THOMAS F. BRYAN, Dublin; Lieut. DAVID L. LOWRY, Teague.

To Waco, Texas, Rich Field, Signal Corps Aviation School, for duty, Capt. WILLIAM F. CURRAN, Waco.

To Wichita Falls, Texas, Call Field, Signal Corps Aviation School, for duty, Lieut. MILTON C. WILLIAMS, San Marcas.

To Williamsbridge, N. Y., for duty, from Fort Oglethorpe, Capt. IRA E. PRITCHETT, Houston. For observation and treatment, from New York City, Capt. WILLIAM R. FICKESSEN, San Antonio.

Utah

To Chicago, Ill., Presbyterian Hospital, for instruction, and on completion *to his proper station*, from Camp Grant, Lieut. CLARENCE S. GARDNER, Kaysville.

To New Orleans, La., Charity Hospital, for instruction, and on completion *to his proper station*, from Camp Pike, Capt. WALTER E. WHALEN, Ogden.

To report by wire to the commanding general, Western Department, for assigment to duty, Capt. FREDERICK W. TAYLOR, Provo.

To Sacramento, Cal., Signal Corps Aviation School, for duty, from Waco, Lieut. RAY T. WOOLSEY, East Salt Lake City.

Vermont

To Camp MacArthur, Waco, Texas, as sanitary inspector, from Plattsburg Barracks, Major EDWARD A. TOBIN, North Bennington.

To Hoboken, N. J., for duty, Capt. JOHN R. PLATTON, Fairfield; Lieut. GEORGE G. HALL, Woodbury; from Camp Upton, Lieut. GEORGE C. RUBLEE, Hardwick.

Virginia

To Army Medical School for instruction, and on completion *to Boston, Mass.* Harvard Graduate School of Medicine, for further instruction, from Fort Oglethorpe, Lieut. MARSHALL L. BOYLE, Jr., Richmond.

To Camp Crane, Allentown, Pa., for duty, Major HUGH H. TROUT, Roanoke; Lieuts. ALFRED P. JONES, CARL C. WOLFF, Roanoke. Base hospital, from Army Medical School, Lieut. ALBERT P. TRAYNHAM, Richmond.

To Camp Hancock, Augusta, Ga., for duty, Lieut. ALEXANDER A. SIZER, Schuyler.

To Camp Lee, Petersburg, Va., base hospital, from Hoffman's Island, Lieut. BEVERLY P. ECKLES, Richmond; from Williamsbridge, Lieut. EDGAR W. YOUNG, McKenney.

To Camp Logan, Houston, Texas, base hospital, from Fort Oglethorpe, Lieut. ELIJA M. HICKS, Roanoke.

To Camp Meade, Annapolis Junction, Md., for duty, Lieuts. WILLIAM KARP, Portsmouth; CHARLES B. BAUGHMAN, Rural Retreat.

To Fort Monroe, Va., for duty, and on completion *to New York City*, Neurological Institute, from New York City, Major BLANTON HILLSMAN, Richmond.

To Fort Oglethorpe for instruction, Lieut. MARIANO B. CABALLERO, Petersburg.

To Hoboken, N. J., for duty, from Fort Oglethorpe, Lieut. ISAAC H. GOLDMAN, Richmond; from Fort Oglethorpe, Lieut. JOSEPH L. McCABE, Richmond.

To New York City, Cornell Medical College, for instruction in military roentgenology, and on completion *to Hoboken, N. J.*, base hospital, from Camp Dix, Lieut. PATRICK N. CARROLL, Rio Vista.

The following order has been revoked: *To Fort Des Moines, Iowa*, for instruction, Lieut. MOSES CLAYBOURNE, Boone Mill.

Washington

To Camp Fremont, Palo Alto, Cal., base hospital, from Camp Kearny, Capts. RICHARD H. LYON, Bothell; FOREST A. BLACK, EDWARD P. FICK, Seattle; FRANK T. WILT, Steilacoon, Lieuts. HOWARD C. RANDOLPH, Aberdeen; GUY E. MARCY, Montesano; WILLIAM C. KANTNER, HOWARD J. KNOTT, Seattle.

To Camp Lewis, American Lake, Wash., for duty, Lieut. YNGVE J. NYVALL, Seattle.

To Fort Riley for instruction, Lieut. LUNSFORD M. THOMPSON, Spokane.

The following order has been revoked: *To Camp Kearny*, Linda Vista, Cal., base hospital, Lieut. BERTON E. FLEMING, McCreary.

West Virginia

To Camp McClellan, Anniston, Ala., as orthopedic surgeon in the camp, from [illegible] BYRON W. STEELE, Mullens.

To Camp [illegible] Ohio, for duty, Capts. ORRA F. COVERT, [illegible] R. MEIGHEN, Wheeling.

To Newp[illegible] for duty, from Camp Morrison, Lieut. RALPH H. BOICE, Sistersville.

To New Orleans, La., Charity Hospital, for instruction, and on completion *to his proper station*, from Camp Pike, Lieut. REECE M. PEDICORD, Elm Grove.

To Pittsburgh, Pa., Carnegie Building, for instruction, and on completion *to his proper station*, from Camp Sherman, Lieut. JOHN E. MILLER, Widen.

To Riverside, Cal., Signal Corps Aviation School, for duty, from Arcadia, Lieut. HARRY R. PARKER, Williamson.

The following order has been revoked: *To Camp Joseph E. Johnston*, Jacksonville, Fla., for duty, from Fort McPherson, Lieut. WILLIAM D. LEWIS, Beckley.

Wisconsin

To Camp Meade, Annapolis Junction, Md., for duty, Lieut. ARTHUR CHARBONNEAU, Green Bay.

To Camp Pike, Little Rock, Ark., as a member of a board examining the command for tuberculosis, from Fort Riley, Capt. HENRY C. CALDWELL, St. Croix Falls. For duty, Lieut. JOSEPH P. SCHLAIKOWSKI, Milwaukee.

To Chicago, Ill., Northwestern University School of Medicine, for instruction, Capt. ERNEST L. BOLTON, Chilton. Presbyterian Hospital, for instruction, and on completion *to Camp Bowie*, Fort Worth, Texas, base hospital, Lieut. HERBERT F. WOLTERS, Milwaukee. On completion *to Camp Grant*, Rockford, Ill., base hospital, Lieut. TIMOTHY J. HOWARD, Milwaukee. On completion *to his proper station*, from Camp Dodge, Capt. PAUL J. LEWIS, Bloomington.

To Hoboken, N. J., for duty, from Camp Mills, Major E. J. BARRETT, Sheboygan; from Camp Custer, Capt. ALBERT A. MAURER, La Crosse; from Fort Oglethorpe, Capt. FRANK E. DARLING, Milwaukee.

To Lonoke, Ark., Signal Corps Aviation School, for duty, from Houston, Capt. PATRICK R. MINAHAN, Fond du Lac.

To Otisville, N. Y., for duty, from New Haven, Capt. MICHAEL R. WILKINSON, Oconomowoc.

The following order has been revoked: *To Camp Kelly*, San Antonio, Texas, for duty, from Camp MacArthur, Lieut. GEORGE W. HARRISON, Ashland.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

ILLINOIS

Section Officers.—At the annual meeting of the Illinois State Medical Society, Dr. Wesley H. Peck, Evanston, was elected chairman of the eye, ear, nose and throat section, and Dr. Frank Allport, Chicago, was elected secretary of the section.

Vaccination Rule to Be Enforced.—On account of the increasing epidemic of smallpox throughout Illinois, the officials of the state board of health are urging stringent enforcement of the vaccination rule. The board suggests that every person not previously vaccinated within a five-year period be vaccinated. A prevention and treatment propaganda by means of moving picture films for use in all theaters has been started by the state department of health.

Personal.—Dr. Clarence W. East, Springfield, is reported to have passed first in the examination for chief of the division of tuberculosis of the department of public health.——A reception was given by the Bureau County Medical Society at Princeton, May 28, in honor of Dr. Oliver J. Flint, Princeton, who has been called to army service. Dr. Rolando H. Henry, Tiskilwa, was the toastmaster. Dr. Samuel W. Hopkins, Walnut, presented the toast, "Dr. Flint as a Citizen"; Dr. John H. Franklin, Spring Valley, "Dr. Flint as a Physician"; Dr. Charles C. Scott, Princeton, "The Physician's Place in War"; Dr. Joseph M. O'Malley, Ohio, "The Physician Patriot," and Dr. Alfred E. Owens, Princeton, "A Memorial of Friendship."——Dr. Charles H. Spencer, Wheaton, is said to have been sentenced, May 10, to imprisonment for thirty days in the Wheaton jail, by Judge Landis, on a charge of violating the draft law.

Plan for Tuberculous Soldiers.—A plan is suggested whereby the central division of the American Red Cross, the Illinois State Department of Public Health, and the Illinois Tuberculosis Association agree to cooperate in securing adequate care and treatment for the returned tuberculous soldier, whether he may or may not have been discharged in line of duty. This plan includes the notification of the return of tuberculous soldiers to the central division of the Red Cross, by the home service section of the local chapter, which will then get in touch with the soldiers and ascertain the facts desired. The Illinois Tuberculosis Association will furnish to the central division of the American Red Cross complete records of all returned tuberculous soldiers with whom communication has been established or whose return has been reported to the association. In the shortest practicable time, then, it will have all returned tuberculous soldiers examined, their cases diagnosed and the proper methods of treatment outlined, and it will report on these matters to the central division. The Illinois Tuberculosis Association will enlist the services of experts in the diagnosis of tuberculosis, and have competent nurses as the necessity arises. The expenses of transportation to the central examining points are to be advanced by the local service section of the Red Cross, providing the patient is unable to pay them himself. The special examiners will cooperate with the local health officers so that the home service section may be in touch with the returned soldiers at all times, and the local health officer may be enabled to protect the interests of the civil population. The results of all examinations are to be reported to the state department of public health. In the interim between the return of the tuberculous soldier and his examination and the outlining of plans for his more permanent care, the home service section of the American Red

Cross will render the returned soldier such care as he may require. The temporary or permanent housing of a returned soldier, in the county almshouse will not be countenanced by the American Red Cross. The organization will pay one third of the expense of sanatorium or other care, providing the remaining two thirds can be secured from individuals or special agencies. All records are to be open to representatives of all parties to the agreement, and complete reports of progress are to be sent frequently to the central division of the American Red Cross.

Chicago

Personal.—Dr. Thomas H. Boughton has been appointed coroner's physician, to succeed Dr. William H. Burmeister, who has started for France.——Dr. Nathaniel H. Schaffner, charged with violation of the Harrison Narcotic Law, is said to have pleaded guilty to the unlawful sale of drugs and to have been sentenced to a term of two years' imprisonment in the federal penitentiary, Leavenworth.——"Dr." Richard Langfield is said to have been fined $100 and costs and sentenced to six months imprisonment by Judge Haas, May 14, on the charge of practicing medicine without a license.

Hospital Car.—The new hospital car, which is to be used in the transportation of the patients from the Psychopathic Hospital direct to the state hospitals at Dunning, Elgin and Kankakee, was open for inspection at the Psychopathic Hospital, June 4, from 1 to 5 p. m. The car, built by the Chicago Railways Company at a cost of $16,000, has accommodation for twenty-four male patients, seats for twenty and cots for four, and fourteen female patients with seats for twelve and cots for two. The car is provided with two toilet rooms, ice water, and has additional doors at the end through which stretchers may be carried into the car. The first trip of the car will be made to Dunning, on June 13, and on the following day a trip to Elgin or Kankakee will be made.

INDIANA

Vincennes Physician Found Guilty.—Dr. Wilhelm T. von Knappe, Vincennes, who recently was found guilty in federal court and sent to jail for one day, on the charge of sending obscene literature through the mail, entered a plea of guilty to the charge pending in the Knox Circuit Court.

Personal.—Dr. Anexamander M. Hayden has been appointed president of the Evansville Board of Health, succeeding Dr. Carl G. Viehe, deceased.——Dr. Otis M. Keyes, Dana, is critically ill on account of cerebral hemorrhage.——Dr. Charles E. Caylor, Pennville, has moved to Blufftown where he will open a private hospital.——Dr. Giles E. Mowrer has resigned as chief physician at the Indiana Reformatory, Jeffersonville.——Dr. Anexamander M. Hayden has been elected president, Dr. Gardner C. Johnson, vice president, and Dr. Walter R. Cleveland, secretary, of the Evansville School Clinic for Indigent Children.——Lieut. Carl L. Souder, Columbia City, has been ill with bronchial pneumonia in the base hospital at Camp Grant, Rockford, Ill.

MARYLAND

Nurses in Service.—At the last session of the Maryland State Nurses' Association, held last week at Cumberland, the president submitted a report which showed that of the graduate nurses in Maryland, more than 500 have registered for Red Cross work, and of this number approximately 250 are already in active service.

Health Officers Named.—The following physicians have been appointed health officers for Carroll County by the county commissioners: Drs. Franklin H. Seiss, Taneytown; Luther Kemp, Uniontown; George L. Wetzel, Union Mills; Harry F. Bare; Milton D. Norris, Eldersburg; William R. S. Denner, Manchester; Lewis K. Woodward, West Minister; Daniel M. Resh, Hempstead; Roland R. Diller, Detour; Abraham T. Cronk, Taylorsville; J. S. Getty; Thomas H. Legg, Union Bridge; Edgar H. Willard, Knoxville, and Daniel B. Sprecher.

Legacy to Hopkins.—The Johns Hopkins University and the Johns Hopkins Hospital have been given a legacy estimated to be valued at $700,000, which is to be divided equally between the university and the hospital. As there were no restrictions placed on its use, it is probable that the income will be used to augment the general funds of the Johns Hopkins. By the same will, the Franklin Square Hospital has received $25,000, the income of which is to be used in the maintenance of a room for those who would be uncomfortable in the free ward.

Personal.—Dr. Nathan R. Gorter, one of the most prominent physicians of Baltimore city, is critically ill at his home. According to his physician, Dr. Gorter's illness began with a severe streptococcus infection of the throat about ten days ago. He immediately developed a high temperature, accompanied by a spread of the infection to the intestinal tract. This was followed by arthritis and facial erysipelas. His condition is only slightly improved.——Dr. Luigi A. Stefano has been appointed health warden for the fifth district by Health Commissioner John D. Blake.——Dr. Eugene McE. Van Ness and Dr. Walter L. Denny, Jr., have been named as members of the board of surgeons in place of Drs. James M. Craighill and William S. Gilroy, who are on the police board.——Dr. William F. Sappington of Hancock, who was with the British Medical Corps in France and was slightly wounded by a bursting shell six months ago, has been transferred to the United States Army and has been made camp surgeon and commander of a hospital with a capacity of 750 patients, "somewhere in France."——Dr. Edward P. Smith, superintendent of the Mercy Hospital, Baltimore, has resigned to enter private practice. Dr. Smith is a graduate of the class of 1912, College of Physicians and Surgeons, Baltimore, and has been superintendent at Mercy Hospital for five years. He will still retain his connection with the hospital as a member of the visiting staff in the department of general surgery.——Word has been received that Capt. Charles W. Maxson, who was captured in France, April 26, by the Germans, was not injured when taken prisoner. Captain Maxson had been loaned to the British for special trench service and had been decorated with the Distinguished Service Order by the British government.

MASSACHUSETTS

Harvey Cushing Honored in Ireland.—Major Harvey Cushing, M. R. C., on May 25, received an honorary fellowship from the Royal College of Surgeons of Ireland at Dublin. Major Cushing has been abroad for about one year as head of Base Hospital No. 5, the Peter Bent Brigham Hospital unit.

MISSISSIPPI

Appropriation for Sanitation.—The city council of Pascagoula has appropriated $10,000 and the city of Moss Point, $7,000, which, with the $8,000 available from the national government, will make up $25,000 and will be used to introduce proper sanitation into the shipyards district.

State Society Officers.—At the fifty-first annual meeting of the Mississippi State Medical Association, held in Jackson, May 14 and 15, under the presidency of Dr. Willis Walley, Jackson, the following officers were elected: president, Dr. Waller S. Leathers, University; vice presidents, Drs. Ira B. Seale, Holly Springs; William G. Gill, Newton, and William D. McCalip, Yazoo City; secretary, Dr. Thomas M. Dye, Clarksdale; treasurer, Dr. James M. Buchanan, Meridian; councilors, second district, Dr. Billy S. Guyton, University; ninth district, Dr. John C. McNair, Fayette, and tenth district, Dr. Daniel J. Williams, Gulfport. Hattiesburg was selected as the next place of meeting.

MISSOURI

Personal.—Dr. Eugene H. Bullock, St. Joseph, has been appointed director of health of Kansas City.——Dr. Emmett P. North, St. Louis, has been appointed a member of the Missouri State Board of Health, succeeding Dr. Marc R. Hughes, St. Louis, who has resigned to enter military service.——Dr. William L. Gleaves, Kansas City, sustained a serious injury of the eye in an automobile collision, May 17.

NEW JERSEY

Montclair Physicians Patriotic.—At the annual meeting of the Associated Physicians of Montclair and vicinity, held at Montclair, May 27, a special tribute was paid to seventeen members of the organization who are in military service. Dr. Richard Cole, Newton, was elected president; Dr. Leslie C. Love, Montclair, vice president; Dr. Browne Morgan, Bloomfield, secretary, and Dr. James W. Krichbaum, Upper Montclair, treasurer.

Personal.—Dr. Enoch Hollingshead, Pemberton, and J. Clifford Haines, Vincentown, have been elected members of the board of managers of Pine Rest, the Burlington County Sanatorium for Tuberculosis, New Elizabeth. Dr. D. F. Reamer, Mount Holly, has been made superintendent of the institution and secretary of the board.——J. A. Fetzer has accepted the presidency of the New Jersey State Conference on Charities and Correction.——Dr. Eugene L. Reed, Atlantic City, was stricken with a cerebral hemorrhage, May 3.

NEW YORK

Personal.—Dr. William H. Heath has been appointed director of hygiene and education of Buffalo, and Dr. Frederick W. Koehler, medical inspector of food industry.

Examination for Health Officers.—The board of health of the Lake George health district announces a competitive examination for the position of full-time health officer at a salary of $3,000 a year and expenses. Application blanks may be secured from Mr. Loyal L. Davis, Glens Falls. The examination will be both written and oral, the latter part of it being held at Lake George, June 14, at 10 a. m. Applicants should state whether they have taken a special course in public health as provided by the Public Health Service, whether they have been exempted from such a course, or whether they are now registered for this course, and, if so, the name of the university where they are registered and when they expect to complete this course.

New York City

Hebrew Asylum Anniversary.—The Brooklyn Hebrew Orphan Asylum celebrated the fortieth anniversary of its founding, May 26, with an elaborate program. Commissioner of Charities Bird S. Coler made the principal address.

Mackay Home Offered as Hospital.—Clarence H. Mackay has offered his country home at Roslyn, L. I., with its 600 acres of fields, drives and buildings, to the American Red Cross for use as a base hospital. It is estimated that without difficulty it could care for 400 or 500 patients.

Red Cross Starts Drive for Nurses.—The Atlantic division of the American Red Cross celebrated Memorial Day by forming committees to direct a drive for nurses which starts next Monday. The Red Cross states that 5,000 nurses are needed now for the American Army abroad and that 25,000 will be needed before the close of the year.

Medical Aid for Palestine.—The New York Chapter of Hadassah, the women's Zionist organization, has completed the equipment of a medical unit for Palestine, consisting of fifty-one physicians and nurses. It has sent out an appeal for $1,000 to meet the cost of a motor truck which is needed. This unit is to form the foundation of a large and permanent system of medical relief work that is to be conducted in Palestine on a basis of assistance to all, irrespective of race or religion.

Hospitals Aid Draft Registrants.—The New York hospitals, in response to an appeal from the government, have notified Adj.-Gen. Charles H. Sherrill that they are prepared to give medical and surgical treatment to those registrants of Class 1, who have been classified as eligible for military service, subject to necessary surgical operation or medical treatment. Dr. Victor C. Pedersen, chief medical officer of the selective draft for New York, will be in charge of this part of the draft work in New York.

Health Department Official Denied Open Trial.—Charges of neglect of duty, inefficiency and incompetence have been preferred against Dr. Lucus P. Brown, director of the bureau of foods and drugs of the health department, by Health Commissioner Copeland. This action has been taken, notwithstanding the promise, made soon after Dr. Brown's suspension, that he would be given an open trial and would be allowed to have counsel and witnesses. It is understood that the public will not be permitted to be present at the hearing.

Greenhut Building for Government Hospital.—The Medical Department of the Army has leased the building formerly occupied by the Greenhut Company Department Store for the period of the war and a year thereafter. The Greenhut building is six stories high and the estimated floor space is 1,000,000 square feet. The government will immediately turn this building into a modern hospital with 4,000 beds. It will be known as the Sixth Avenue Hospital, and will be used as a clearing hospital and for medical cases, the surgical cases being sent to better equipped hospitals nearby.

Poor Milk Raises Infant Death Rate.—The records of the New York City Health Department show that there is an increase of five per 10,000 in the deaths of infants during the five months of 1918, as compared with the corresponding period of 1917. This increase is attributed to impure milk and to lack of nourishment. Commissioner Copeland has planned to confer with the big milk dealers of the city and has ordered the director of the bureau of foods and drugs to begin an exhaustive inspection of all stores handling milk, as well as of the plants of the big milk companies.

OHIO

Fight Against Epidemics.—To prevent the spread of communicable diseases the city council of Toledo has voted to transfer $75,000 to the epidemic fund of the municipal welfare department.

Personal.—Dr. Samuel C. Caldwell has resigned as physician to the Ohio Boys' Industrial School, Lancaster.——Dr. Charles C. Jones, Canton, is said to have been indicted by the grand jury, May 7, on a charge of performing a criminal operation. He was released on a $2,500 bond.

Saving the Children.—Twelve counties of the state saved their respective quotas of children during the three months, even though the Children's Year had not yet opened. These counties, with their quotas, totaling 50, are: Auglaize 4, Coshocton 6, Delaware 4, Gallia 4, Hancock 6, Hardin 6, Huron 3, Morrow 2, Noble 6, Union 3, Van Wert 3, Madison 3. Six of these each saved one more than its quota and two saved two more each, giving an excess saving of ten. Twenty-two cities which saved their quotas, or more than their quotas, are as follows: Delphos, Conneaut, Nelsonville, East Liverpool, Salem, Coshocton, Gallipolis, Xenia, Norwood, Findlay, Kenton, Bellevue, Jackson, Mount Vernon, Bellefontaine, Elyria, Piqua, Circleville, Mansfield, Tiffin, Bowling Green, Wapakoneta. Their total saving was seventy-four babies. Of this total saving of 134 in twelve counties and twenty-two cities, all but the thirteen saved in the state at large was neutralized by the records of thirty-six counties and thirty cities, which showed a loss as compared with 1916. In this group Cincinnati lost fifty-eight more than in 1916, and Columbus lost twenty-nine more. Cleveland failed to attain her quota, but saved fifty-eight more than in 1916.

OREGON

Personal.—Dr. William L. Parker, Baker, who is under treatment at St. Vincent's Hospital, Portland, is reported much improved.——Dr. William W. Kimmell, Lebanon, is reported critically ill at his home as the result of a cerebral hemorrhage.

Mackenzie Hall Dedicated.—Mackenzie Hall, the new building of the University of Oregon Medical School, Portland, was dedicated, May 1. Dr. Kenneth A. J. Mackenzie, dean of the medical school, presided. The dedicatory address was delivered by President Ernest H. Lindley, of the University of Idaho. The cornerstone was laid by Governor Withycombe. The compus contains about 21 acres, half of which is to be devoted to medical school buildings; the other half has been set aside for hospital sites.

PENNSYLVANIA

Personal.—Dr. Lincoln R. Light, Lebanon, who has been ill with pneumonia, has recovered and resumed practice.——Dr. William S. Peirce, Warren, is reported to be seriously ill in a hospital in Buffalo.——Dr. Joseph H. Hayes, Lock Haven, is under treatment in the Lock Haven Hospital on on account of paralysis.——Dr. Jane R. Baker, West Chester, has been appointed trustee of the Asylum for the Chronic Insane at Wernersville.——Dr. J. W. Campbell, Elderton, has gone as a medical missionary to Wukari, Northern Nigeria, West Africa.

Philadelphia

Personal.—Dr. Richard D. Burke has succeeded Dr. John H. Remig, resigned, as coroner's physician.——Dr. Alfred Ettinger, head of Christ's Home for Children, suffered a fracture of the skull and other injuries by the overturning of an automobile near Hatboro, April 28, and is under treatment in the Abbington Memorial Hospital.——Dr. Wilmer Krusen, director of health and charities, has been given the degree of Doctor of Laws by the University of Pittsburgh.——Dr. Richard D. Burke, a select councilman from the twelfth ward, was appointed coroner's physician, May 25, succeeding Dr. John H. Remig, resigned.——Mr. John F. McEvoy, chief deputy of the department of internal revenue, was one of the speakers at the West Philadelphia Medical Society, May 28. His subject, "Recent Rulings," related to laws of the department as they affect physicians.

Officers Elected.—At the annual business meeting of the alumni association of the Jefferson Medical College the following officers were elected: president, Dr. P. Brooke Bland; first vice president, Dr. Henry K. Gaskill; second vice president, Edward J. G. Beardsley; third vice president, William S. Higbee; fourth vice president, Dr. J. Leslie Davis; corresponding secretary, Dr. Elmer H. Funk; recording secretary, Dr. Edward J. Klopp; treasurer, Dr. Warren B. Davis. At the annual banquet held at the Arcadia Café, Dr. Chevalier Jackson, the retiring president, was toastmaster.

SOUTH CAROLINA

Personal.—Dr. Francis B. Johnson, Charleston, has been made director of the state laboratory, Columbia, succeeding Dr. Francis A. Coward, who has entered the military service. ——Dr. Herbert E. McDowell, Spartanburg, was struck by an automobile, April 7, fracturing his right arm and sustaining other injuries. He is under treatment at the Spartanburg Hospital.

Palmetto Physicians Meet.—At the twenty-third annual meeting of the Palmetto Medical Association, an organization of colored physicians, dentists and pharmacists, held in Orangeburg, April 25 to 27, Dr. William H. Johnson, Charleston, was elected president; Dr. Seibels R. Green, Orangeburg, vice president; Dr. Jesse H. Thomas, Camden, secretary, and H. H. Cooper, Columbia, treasurer. The 1919 meeting will be held at Denmark.

WISCONSIN

New Medical Infirmary.—The University of Wisconsin reports the receipt of gifts amounting to $100,000 which, with an appropriation of $50,000 from the legislature of 1917, will be used in the construction of a new infirmary for the medical school.

Sanatorium Site Selected.—The location for the Tri-County Tuberculosis Sanatorium for Ashland, Bayfield and Iron Counties has been finally chosen, Salmo, Bayfield County, on Chequamegon Bay being the site selected. Plans are being made, and the construction of buildings will be begun at the earliest possible date. Ashland County has voted $31,500, Bayfield County $26,000, and Iron County $20,000 toward the sanatorium.

CANADA

Second Medical Board of Review.—A second medical board of review has been established in the Toronto Military District. The following are the members thereof: Major Edward B. O'Reilly, Hamilton; Capt. Robert L. Morrison, and Capt. Julian D. Loudon, Toronto.

Dominion Health Commission.—At Ottawa recently, before Mr. Justice Hodgins, Toronto, who is conducting an inquiry for the Ontario government into the extent of feeblemindedness and venereal diseases in that province, Gen. John T. Fotheringham, Toronto, advocated the establishment of a Dominion health commission with plenary powers and authority to enforce treatment and segregation, if necessary, for the purpose of coping with the problem of venereal diseases among the civil population of the Dominion.

Medical Week in Hamilton.—A very successful conference of the medical men completed, Saturday, June 1, one of the largest medical meetings ever held in Canada, as about 1,000 were registered from all over the Dominion. Four medical associations held their annual meetings, the Canadian Medical Association, the Ontario Medical Association, the Health Officers' Association of Ontario, and the Canadian Medical Protective Association. Also, were held the annual meetings of the Canadian Public Health Association, and the Association for the Prevention of Tuberculosis, but these two admit laymen to membership. The secretary of the last organization stated that there is now in Canada accommodation for 3,000 tuberculosis patients, and that more than $900,000 was annually expended on the work. More than $3,000,000 are invested in plants. It was the intention of that association to trace the men with tuberculosis rejected by the army and to treat them. The Canadian Medical Protective Association in its annual reports showed satisfactory progress. It was felt, however, that the association should be better patronized by the profession, as its membership still stays at about 1,000. Dr. Robert H. W. Powell, Ottawa, was reelected president, and Dr. J. Fenton Argue, Ottawa, secretary-treasurer. A feature of the meeting was the poster display of the American Medical Association on the patent medicine outrage. The idea was expressed that some plan for closer association of the two national medical bodies, the A. M. A. and the C. M. A., should be formed in order to carry on successfully a determined campaign to offset this great evil. The Association of Health Officers of Ontario had many exhibits, as well as the health department of Toronto. The latter showed various tests for water and milk, also apparatus in connection with rendering germs visible. The former showed antitetanic serum in all the stages of its preparation. This came from the Connaught Laboratories of the University of Toronto. Since the war began, these laboratories have sent overseas more than 140,000 packages of this product. Dr. J. Alexander Hutchinson was elected president of the Canadian Public Health Association, the acting secretary being Dr. Robert D. DeFries, Toronto. Dr. George R. Cruickshank, Windsor, was elected president of the Health Officers' Association of Ontario, and Col. John W. S. McCullough, Toronto, remains as secretary of the organization. Perhaps, the keenest interest shown by the members of the congress, from a practical and scientific standpoint, was manifested in the address on surgery by Dr. Charles H. Mayo, and in the address on medicine by Dr. Lewellys F. Barker. Cancer was the subject of Dr. Mayo's address. He declared that 200,000 people have it in the United States and that 80,000 die annually from the disease. The death rate in Ontario is about 2,000 per annum. Dr. Barker dealt with heart murmurs, especially as they apply to the rejections in the army. The surgeons passed a resolution calling for the control of the issuance of licenses to surgeons. Whenever such legislation is enacted, it will require all surgeons to take three extra years of study, either in a hospital, or with a qualified surgeon. The officers elected for the Ontario Medical Association were as follows: President, Dr. George S. Cameron, Peterboro; treasurer, Dr. Gordon A. Bates, Toronto; secretary, Dr. Thomas C. Routley. Next year the annual meeting will be held in Toronto.

GENERAL

Pediatric Officers.—At its thirtieth annual meeting held in Lenox, Mass., May 27, 28 and 29, the American Pediatric Society elected the following officers: president, Dr. Edwin E. Graham, Philadelphia; vice president, Dr. Henry Heiman, New York City; secretary, Dr. Howard C. Carpenter, Philadelphia; treasurer, Dr. Charles Hunter Dunn, Boston, and recorder, Dr. Oscar M. Schloss, New York City. The next meeting will be held in Atlantic City.

American Association of Anesthetists Meets.—The sixth annual meeting of this association will be held in Chicago, June 10, at the Auditorium Hotel. A program of papers has been provided. Dr. F. W. Nagle, Montreal, is president of the association, and Dr. Isabella C. Herb, Chicago, is one of the vice presidents; Dr. James T. Gwathmey, now in France, is secretary and treasurer, and Dr. F. H. McMechan, Avon Lake, Ohio, is acting secretary.

Bequests and Donations.—The following bequests and donations have recently been announced:

Polyclinic Hospital, New York City, a gift of $1,000 to be applied to the support of free beds in the ophthalmological service of Dr. Earle Conner.

Emory University and Oglethorpe University, Atlanta, each $5,000 by the will of Dr. William S. Kendrick, senior professor of medicine at Emory Medical College.

Presbyterian Hospital, Philadelphia, $10,000, Polyclinic Hospital, $5,000, and Women's Hospital, $5,000 by the will of Mary L. Baugh, Philadelphia.

Status of Library of the Surgeon-General's Office of the Army Defined and Books to be Added.—While the library of the Surgeon-General's Office of the United States Army has for many years been open freely to the medical profession of the entire country, notwithstanding that the library has been in fact primarily an adjunct to the Army, its public and general status is now officially recognized in a bill passed by the United States Senate on May 17. The bill provides that this being the large general medical library for the use of the medical profession of the United States, in the copyrighting of the books on medical and allied subjects there shall be deposited with the Congressional Library three copies, one of which shall be for file in the library of the Surgeon-General's Office of the United States Army. The bill now goes to the House of Representatives for consideration.

Unauthorized Subscription Pedlers Arrested.—Dr. Charles Ryttenberg, Port Chester, N. Y., writes that he has succeeded in "landing" one of the ringleaders of the subscription fraud that has been worked for several years past—chiefly on members of the medical profession. Among the titles used in this fraud were "United Students Aid Society," "Advance Society of the University of Illinois," "Michigan Educational

Association," "National Educational Society" and "University Progressive Club." On Sept. 18, 1915, Dr. Ryttenberg was a victim to the extent of $5 under the head of "The Michigan Educational Association"; recently, under the guise of the "American Defense Association," an attempt was made to solicit him again, the statement being made that the subscription would assist a man into the Engineering Corps of the United States Army. He called the police and the solicitor was arrested. After three days the solicitor confessed that he and two others had been working the country for some time, and produced the various types of receipts used by them. He also divulged the names of others involved in the scheme.

FOREIGN

"New and Nonofficial Remedies" in France.—The *Progrès Médical* of May 4, just received, gives a description of the work of the Council on Pharmacy and Chemistry of the Americal Medical Association and of its publication "New and Nonofficial Remedies," "founded," it says, "with the aim of informing the members of the medical profession as to the value of the proprietary medicinal articles which flood America." The *Progrès* adds, "Looking over the 1917 edition of this work, we see that of the 500 or 600 products therein inscribed, there are not even ten of French make. More than half of them are manufactured by German firms; the others come from England or are made in the United States. . . . The reason for this, we are told by Monsieur Puckner, president of the Council on Pharmacy and Chemistry, which has charge of the publication of the work, is that the German proprietary pharmaceuticals have been sent in large numbers to America, and consequently a large number were presented for examination by the Council. Another reason for the small number of French proprietaries included is that among those which were sent to America and offered for examination by the Council, many did not comply with the rules governing the admission of proprietary articles to the book 'New and Nonofficial Remedies.'" The *Progrès* then gives in full detail the object of the rules, the contents of the book, the definitions of terms, and the six main rules governing, respectively, composition, identification, direct and indirect advertising, fraudulent claims as to origin, and unwarranted therapeutic claims. The article is published also in the April number of the French *Journal de pharmacie et de chimie.*

The Arsphenamin (Salvarsan) Investigation in Germany.—The *Nederlandsch Tijdschrift* relates that, in reply to an interpellation by one of the deputies, the minister of internal affairs in Germany declared that his study of the subject had shown no grounds for interfering with the use of arsphenamin by the medical profession. The responsibility for its use rests on the physician, and there is no call for the state to interfere. This has elicited a protest from Dreuws, who started the ball rolling two years ago. He published an article in the *Deutsche Zeitung* of Feb. 28, 1918, in which he said that the medical journals have closed their columns to him, but he declared he knows that paralysis, after the use of arsphenamin, has occurred in the proportion of 224 per hundred thousand cases; blindness in 1.3; serious skin lesions in 620; lesions in the brain in 61.3; and deafness, unmistakably due to the arsphenamin, in 16, and, probably due to it in 14.6. He protested that the government inquiry among specialists was like asking brewers whether the use of alcohol should be permitted. The minister in his investigations had found twenty deaths after the use of arsphenamin among the 265,158 cases from the practice of 500 physicians. Dreuws stated that he had heard or read of sixty-seven fatal cases, and warned that cases might escape record, as the blindness or deafness might not develop until weeks after the arsphenamin treatment. Pinkhof, in commenting on this in the *Tijdschrift* mourns that the day has passed when the value of a remedy was determined by physicians. "Nowadays," he says, "the discoverer of the remedy or his friends rush before the public with such claims for the superiority of their product that there is no opportunity for a calm comparative study of it. If we do not prescribe this new 'superior' remedy, we are regarded as being behind the times, or worse. This advertising to the public avenges itself—on the public in the first place, and then also by sapping the confidence of the public in medicine as a whole."

Competitive Examinations for Internships After the War.—The Paris Société médicale des hôpitaux has been discussing ways and means by which medical students now serving in the war will be able to win places as interns after demobilization. Three resolutions were adopted and they are offered for the approval of the profession in general and of the hospital authorities: 1. That each medical student or recent graduate should have his army record carefully made out and verified by signatures, a *carnet de campagne,* on which should be recorded the young man's position and work, the number of months under fire, the number of engagements in which he has taken part, the wounds he has received, citations, decorations, etc., a verified and attested biographical record of his army service during the war. 2. There should be two competitive examinations at a few months' interval, the first being open only to those who have been serving in the army; and only half the vacant posts are to be filled from this first examination. The second examination is open, as usual, to all, including those who failed at the first examination. 3. The principle is advocated of allowing the military candidates a certain number of credits proportionate to the length of their service at the front. The idea is not to give many credits, merely one credit for each six months' work under fire, and half a point for each six months' work in a division ambulance. This plan will give the men from the front a trifling superiority over those who have been in the home zone. In the second competitive examination, it will give to the men who have been under fire a slight advantage over the nonmobilized, women candidates, foreigners, and all those who have been able to carry on their medical studies undisturbed. This will, to an extent, equalize the race between a candidate who recites by heart pages of anatomy learned from a textbook and another candidate who has given the most magnificent proofs of devotion, courage, decision of character, and knowledge through practical experience.

SOUTH AND CENTRAL AMERICA, MEXICO AND WEST INDIES

Exclusion of Alien Members.—Last November, when Brazil declared war against Germany, the Sociedad de Medicina e Cirurgia of S. Paulo held a special open meeting and adopted resolutions congratulating the president of the republic for the stand he had taken. At the same meeting it was voted to drop from the membership of the society members of enemy nationality.

Honduras Organizes Public Health Department.—The *Vida Nueva* of Havana reports that Honduras has created the Departamento de Salud Publica and remarks that this represents progress for this Central America republic. It continues "It may not be amiss to refer once more to the fact that for many years there has been a public health service in Cuba, the Secretaria de Sanidad, which is the pride of the country."

Public Health Efforts in Cuba.—The Liga contra el Paludismo, Uncinariasis y Tifoidea Rural was recently organized in Cuba under the auspices of the Public Health Service and the state department of public instruction. The president of the league is Dr. M. G. Lebredo, the secretary, Dr. A. Vieta, and each province is represented on the board, of which Dr. D. Tamayo is chairman. The official organ of the new league is to be the *Eco Cientifico,* published at Ciego de Avila.

New Ophthalmologic Journal in Mexico.—For seventeen years Dr. M. Uribe Troncoso edited the *Anales de Oftalmologia* in Mexico, but with his recent removal to New York, this journal was merged with others to form the *American Journal of Ophthalmology.* The Mexican Ophthalmologic Society, of which he was long president, has now decided to publish its own annals, and the *Anales de la Sociedad Oftalmologica Mexicana* has already made its appearance. Dr. D. M. Velez is director of the *Anales* and perpetual secretary of the society. Summaries of the two leading articles are given in both English and French, and duplicates are published on an insert for convenience of reviewers. The officers of the society for 1918 include Dr. F. Lopez, president; Dr. A. Chacon, vice president, and Dr. E. F. Montaño, perpetual treasurer.

Prizes Open to Spanish-American Physicians.—A Spanish medical journal, *Higia,* published at Madrid, offers a series of prizes for the best article on various topics. Competition is restricted to physicians and medical students of verified Spanish or Spanish-American nationality, and the articles must be sent in anonymously with the name in a sealed envelop on or before Dec. 31, 1919. The *Vida Nueva* for May reproduces all the conditions. The grand prize is for any research work yielding a positive progress for medicine. Six other prizes are offered for the medical bibliographic index of Spain or Spanish-America, from 1900 to 1920, with critical comment; for the history of medicine in Spanish-America during the fifteenth and sixteenth centuries; the Spanish race in the Spanish-American republics; and the treatment of cancer. Other prizes are offered for students. The executive committee in charge of the matter is seeking the patronage and the financial support of the government in Spain and in the different Spanish-American republics to further this prize competition as an educational and enlightening force. The amount of the prizes naturally will depend on the financial support obtained.

PARIS LETTER

Paris, May 2, 1918.

National Headquarters for Rehabilitation of Crippled and Disabled Men

In order to coordinate the work of the public authorities and the private institutions and organizations which are working for the rehabilitation of soldiers, sailors and aviators disabled by wounds received in the war or who are suffering from diseases contracted during the war, there was recently established l'Office National des mutilés et réformés de la guerre. It will be the function of this commission or office to centralize information concerning the activities of public administrations and private organizations, also to encourage and facilitate the work of readapting the military mutilés for self support; to study legislative dispositions and regulations susceptible of being taken advantage of in their favor; to follow their application, and, in a general manner, to assure them of patronage and the permanent support of the nation, which is their due. The resources of this commission or office are: (1) an annual credit included in the budget of the ministère du travail and of the prévoyance sociale; (2) gifts, donations and legacies of every kind which should be made either to the commission directly, to the *ensemble* or to a definite group of *militaires* or former *militaires mutilés et réformés.*

Determination of the Origin of the Wounds and Diseases of Soldiers

To ascertain the origin of wounds or disease is a matter of great importance to the soldiers. At present, pay is allowed only for wounds or diseases contracted or aggravated while in service. Gratuities or pensions of any kind are given only for infirmities contracted or aggravated while in service or the result of the dangers and fatigues of military life. Finally, for the wives, the death of the husband as the result of the eventualities of war, confers the right to a higher pension. Therefore, Dr. Louis Mourier, under-secretary of state for the Service de Santé militaire has sent out a circular specifying those wounds or infirmities which will be considered as having been contracted while in the service or aggravated thereby, and those which will not be so considered:

(1) Wounds or infirmities contracted while in service or aggravated thereby: All wounds or diseases proceeding from the fatigues or dangers of military service, that is to say, in relation with it, of such a nature as the interested person would not have been exposed to had he not been in the service. (2) Wounds or infirmities resulting from war operations or the eventualities of war: All lesions resulting either from a direct or indirect action of the enemy, or from participating in a premeditated action against the enemy, either preparatory to it or during the action.

(3) Wounds and diseases not incident to service: Those not included in any of the above categories, that is to say, not being caused or aggravated in any sense of the word by military service, its fatigues or dangers, such as traumatisms received and maladies contracted while on furlough or while acting contrary to orders; traumatisms received and diseases contracted outside of the service and the fault of the interested person, for which the state should not be held responsible, such as a quarrel in a saloon, accident of drunkenness; diseases the result of intemperance; hereditary diseases not aggravated by service; diseases existing prior to entrance on military service.

Hospitalization of Army Nurses Who Have Contracted Pulmonary Tuberculosis

The under-secretary of state for the Service de Santé militaire has had arranged two *formations sanitaires,* one for the military nurses who are known to have pulmonary tuberculosis, and the other for those who are suspected of having tuberculosis, or who are in a state of general exhaustion the result of disease or of hard work. The nurses who will come under this ruling will be obliged to make application, supported by a certificate "de visite et de contre-visite," to the under-secretary of state of the Service de Santé militaire.

The Bread Ration of Contagious Disease Hospitals

The attention of the food commissioner has been called to the necessity for new arrangements in regard to the bread ration of the private establishments which hospitalize contagious disease patients or those suffering from severe maladies. Usually they come to the hospital without being accompanied by any one who could dole out the daily bread tickets with which the person in question should be provided. In order to assure these patients of food, M. Victor Boret, the food commissioner, has given instructions to the prefects to invite the mayors to deliver each month to the chiefs of the establishments, who have made demand, tickets intended to replace those which the patients failed to present at the time of their admission. But, in order to avoid using tickets a second time, the chiefs of the establishments will be obliged to force these patients, the members of their family or other persons interested in them, to return the corresponding tickets to the authorities according to the number of days of their hospitalization.

Repatriation of Members of Hospital Units

All the personnel protected by the Geneva Convention will hereafter be repatriated in regular convoys every other month. The first convoy left in February for Constance; the next, in April, for Lyon, and so on alternately. As for those *sanitaires* belonging to units of which the registers or archives have been destroyed, it will suffice that the state from which they came attests to their character.

Citation of American Nurses

The professional devotion of two American army nurses, who have been recommended for the English military medal, has caused each of them to receive a personal letter from General Pershing. The nurses are, Miss Evan Jean Parmales, a reserve nurse, and Miss Beatrice MacDonald, infirmière-major, of the Presbyterian General Hospital. Each continued to care for the wounded after having been wounded herself by an air bomb.

American Libraries in Paris

The medical library of the American Red Cross has been moved to No. 12, place Vendôme. This library contains books and periodicals, both French and English, bearing on the medicine and surgery of war. On the other hand, a reference library on medical subjects has been arranged at No. 6, rue Piccini.

Inauguration of the Franco-Peruvian Hospital

Recently there was inaugurated in Paris a Franco-Peruvian hospital under the auspices of a Peruvian committee of which General Benavides, former president of Peru, is chairman. Besides the members of the Peruvian colony, representatives of the Association des Dames françaises were among those present. The hospital contains eighty beds. The expense of maintenance will be met by the Peruvian colony.

Sale of Troches and Cough Drops

Deputy Laniel having inquired of the food commissioner whether the bakers and confectioners are authorized to sell the various cough drops which can be bought at pharmacies, he received the following reply: "The *pâtes pectorales,* having only a medicinal character, can be sold only by pharmacies. Other analogous products which do not have that character are confectionery and come under the prohibition of the decree of Feb. 12, 1918."

Donation to the Academy of Medicine

The permanent secretary of the Academy of Medicine has been authorized to accept, in the name of the Academy, a legacy of 25,000 francs made by the late Dr. Magnan. The revenue from this sum will be used to establish a triennial prize to be awarded to the author of the best work on mental medicine.

The Fight Against Tuberculosis

On motion of M. Ambroise Rendu, the municipal council of Paris voted the following resolution: The Administration is invited to place at the disposition of the Rockefeller Foundation Commission on Tuberculosis rooms in the city halls and school yards in which the temporary exhibits and the conferences can be held. The Rockefeller Foundation, in pursuance of its propaganda work, recently held a series of conferences at Rennes which were exceedingly successful.

Deaths

John William Langley, Ann Arbor, Mich.; M.D. (hon.), University of Michigan, Ann Arbor, 1871; aged 76; acting assistant surgeon, U. S. Navy, 1862 to 1864; assistant professor of physics in the U. S. Naval Academy, 1867 to 1870; professor of chemistry in the Western University of Pennsylvania, Pittsburgh, 1871 to 1874; professor of chemistry and physics in the University of Michigan, from 1875 to 1889; professor of electrical engineering in the same institution from 1892 to 1905, and since that time emeritus professor of electrometallurgy; a scientist of international repute; died at his home, near Ann Arbor, May 11.

William Austin Macy, King's Park, New York City; College of Physicians and Surgeons in the City of New York, 1885; aged 55; a Fellow of the American Medical Association, and New York Academy of Medicine; superintendent of the King's Park State Hospital for the Insane, since 1904; formerly assistant superintendent of the Manhattan State Hospital, Ward's Island, and Willard State Hospital; died in the King's Park State Hospital, May 21, from cerebral hemorrhage.

Edward Thomas Abrams, Dollar Bay, Mich.; Dartmouth Medical School, Hanover, N. H., 1888; aged 57; a Fellow of the American Medical Association; appointed a member of the State Board of Health in 1911, and at the time of his death president of the board; for several years a member of the state legislature; one of the most prominent and esteemed practitioners of the Copper Country; died at his home, May 21, from heart disease.

Wallace Eugene Hallock, Juneau, Wis.; University of Michigan, Ann Arbor, 1873; aged 71; a member of the State Medical Society of Wisconsin; president of the Dodge County Medical Society; county physician of Dodge County for forty years; and once mayor of Juneau; while visiting Rockford, Ill., May 20, was struck by a street car and died in a hospital in Rockford from his injuries a few hours later.

Martin Stamm, Fremont, Ohio; University of Berne, Switzerland, 1872; aged 70; a Fellow of the American Medical Association; and president of the Sandusky County Medical Society; for several years professor of operative surgery in the College of Physicians and Surgeons, Cleveland; for two terms a member of the local board of education; died at his home, May 22, from heart disease.

Died in the Service
in France
Lieut. Whitney H. Joyce, M. R. C., U. S. Army, 1891-1918

Lieut. John Groat Corson, M. R. C., U. S. Army, Binghamton, N. Y.; University of Syracuse, N. Y., 1915; aged 27; who had been on duty with a medical detachment of the British Expeditionary Forces in France, and there contracted tuberculosis and was invalided to England, died in a hospital in London, about May 17, from tuberculosis.

William F. Creasy, Newport News, Va.; University of Maryland, Baltimore, 1890; aged 54; a Fellow of the American Medical Association; formerly president of the City Board of Health, and quarantine officer of the port of Newport News; died at his home, about May 18.

Boyle Travers, St. John, New Brunswick; Dublin, 1847; William Stokes prize-man; aged 93; a member of the New Brunswick and St. John, New Brunswick, Medical Society; who began practice in St. John in 1848; died at his home in that city, April 7, from senile debility.

Edward T. Pendleton, Wellsville, Kan.; University Medical College, Kansas City, Mo., 1899; aged 44; a member of the Kansas Medical Society; who was operated on about three months ago at St. Luke's Hospital, Kansas City, for the removal of gallstones; died May 13.

Joseph E. Heard, Baltimore; College of Physicians and Surgeons, Baltimore, 1882; aged 65; surgeon of the Police Department from 1888 to 1900, and a health warden of Baltimore from 1908 to 1918; died in the Church Home and Infirmary in that city, May 21.

Lieut. Whitney Hotaling Joyce, M. R. C., U. S. Army, Unadilla, N. Y.; Albany, N. Y., Medical College, 1913; aged 28; a Fellow of the American Medical Association; who was on duty with the Royal Warwickshire Regiment, British Expeditionary Forces; died in France, from wounds, May 17.

Capt. Frederick David Clair, M. R. C., U. S. Army, Philadelphia; Medico-Chirurgical College of Philadelphia, 1915; aged 27; attached to the Forty-Third Field Ambulance, British Expeditionary Forces in France; is reported to have been killed in action recently.

Herbert Aaron Lord, Pueblo, Colo.; Gross Medical College, Denver, 1898; aged 45; a Fellow of the American Medical Association; county physician of Saguache County, Colo., for several years; died in St. Mary's Hospital, Pueblo, May 15, from cerebral hemorrhage.

Hamilton Earle Russell, Easley, S. C.; Southern Medical College, Atlanta, Ga., 1895; aged 48; a Fellow of the American Medical Association; local surgeon for the Southern Railroad; died suddenly while making a professional call, May 16.

John Snyder McPheeters, Hardinsburg, Ind.; Cincinnati College of Medicine and Surgery, 1860; aged 81; assistant surgeon and later surgeon of the twenty-third Indiana Volunteer Infantry, during the Civil War; died at his home, May 11.

Stephen William Driver, Cambridge, Mass.; Harvard Medical School, 1863; aged 85; a member of the Massachusetts Medical Society; a veteran of the Civil War; consulting physician to the Cambridge Hospital; died at his home, May 21.

James Piner Bartley, Bartlesville, Okla.; Kentucky School of Medicine, Louisville, 1898; aged 51; a Fellow of the American Medical Association; died in the Bartlesville City Hospital, May 20, from cerebral hemorrhage.

Benjamin J. Alexander, Hiawatha, Kan.; Drake University, Des Moines, Iowa, 1882; aged 62; a Fellow of the American Medical Association; and formerly a member of the State Board of Health; died at his home, May 20.

James H. Roll, Hamilton, Ohio; Medical College of Ohio, Cincinnati, 1872; aged 72; a member of the Ohio State Medical Association; a veteran of the Civil War; died at his home, May 16, from cerebral hemorrhage.

Merritt Byron Fairchild, Syracuse, N. Y.; Albany, N. Y., Medical College, 1868; aged 79; health officer of Syracuse for two terms, and for four years physician to the state penitentiary; died at his home, May 16.

William Kennedy, Hamilton, Ont.; Trinity Medical College, Toronto, 1875; aged 70; formerly president of the Conservative Association of Norfolk County; died at the home of his daughter in Hamilton, May 16.

Lieut. Edward Everett Tredway, M. R. C., U. S. Army, Pasadena, Calif.; Denver and Gross College of Medicine, Denver, 1908; aged 39; a Fellow of the American Medical Association; died May 19.

Joseph J. Evans, Winchester, Ind. (license, Indiana, 1897); aged 78; a practitioner of Winchester since 1867; for eight successive terms coroner of Randolph County; died at his home, May 16.

Willie Estes Cobb, Blytheville, Ark.; Louisville, Ky., National Medical College, 1904; aged 43; a colored practitioner; was shot and killed, May 9, in an altercation over boundary lines.

Charles E. Thompson, Stephens, Ark.; Kentucky University, Louisville, 1906; aged 37; a member of the Arkansas Medical Society; died at his home, May 17, from tuberculosis.

Samuel Kennedy Christy, Willshire, Ohio; Medical College of Ohio, Cincinnati, 1880; aged 65; formerly a Fellow of the American Medical Association; died at his home, May 16.

Theodore Milan, Davenport, Iowa; (license, Iowa, 1890); aged 63; died in Mercy Hospital, Davenport, May 17.

Joseph Henry Martin, Los Angeles, Calif.; Dartmouth Medical School, Hanover, N. H., 1871; aged 75; for thirty-three years a resident of Los Angeles; died at his home, May 9.

Adolph Boppart, Richmond, Ind.; University of Zurich, Switzerland, 1856; aged 82; for more than fifty years a pharmacist of Richmond; died at his home, May 13.

H. C. Hollingsworth, Terre Haute, Ind.; Rush Medical College, 1864; aged 75; a veteran of the Civil War; died at his home, March 7, from malignant disease.

Archibald Yhel Martin, Moundsville, W. Va.; Kentucky School of Medicine, Louisville, 1890; aged 57; died at his home, May 17, from disease of the kidney.

Luke H. Kelly, Hammond, Ind.; University of Illinois, Chicago, 1899; a member of the Indiana State Medical Association; died at his home, May 16.

Lewis E. Meeker, Brooklyn; Detroit Medical College, 1872; aged 67; formerly president of the Eastern District Savings Bank; died at his home, May 23.

William W. Roberts, Athens, Ga.; Medical College of Georgia, Augusta, 1891; aged 73; died at his home, at Princeton, near Athens, May 16.

Rebecca H. Reynolds Longshore, National City, Calif.; Pennsylvania Medical University, Philadelphia, 1861; aged 81; died at her home, April 17.

Albert J. Cavert, Nashville, Tenn.; University of Nashville, Tenn., 1872; for many years a teacher in the city schools of Nashville; died about May 11.

H. B. Godby, College Park, Ga.; Atlanta, Ga., Medical College, 1859; aged 86; died at his home, April 9, from paresis following pneumonia.

John Parker Cartwright, Bowling Green, Ky.; Bellevue Hospital Medical College, 1882; aged 67; died at his home, May 9, from carcinoma.

William Hall Carleton, Toronto, Ont.; University of Toronto, 1883; aged 62; died at his home, February 14, from cerebral hemorrhage.

John Newton, Deseronto, Ont.; Queens University, Kingston, Ont., 1866; aged 75; died at his home, February 13, from arteriosclerosis.

Robert Milliken Davis, Wrightsville, Pa.; University of Pittsburgh, 1897; aged 57; died at his home, March 23, from cerebral hemorrhage.

Charles Francis Adams Walsh, New York City; Long Island College Hospital, Brooklyn, 1895; aged 55; died at his home, March 18.

Freeman Hall, Kalamazoo, Mich.; Medical School of Maine, Portland, 1855; aged 84; died at his home, March 30, from acute cystitis.

David B. Snodgrass, Marion, Ind.; Physio-Medical College, Cincinnati, 1878; aged 81; died at his home, May 11, from heart disease.

Owen Franklin Person, Hazelton, Pa.; Jefferson Medical College, 1872; aged 69; died at his home, May 11, from chronic nephritis.

Edward Chapman Hayman, Lincoln, Neb.; University of Nebraska, Omaha, 1908; aged 34; died at his home, March 13.

Isaac A. Wesson, Wingo, Ky.; Vanderbilt University, Nashville, Tenn., 1881; aged 79; died at his home, May 14.

Edward Channing Folsom, Santa Monica, Calif.; Harvard Medical School, 1868; aged 73; died at his home, May 11.

John Perrins, Boston; Eclectic Medical Institute, Cincinnati, 1873; aged 79; died at his home, May 17.

Marriages

Lieut. Louis Tompkins Wright, M. R. C., U. S. Army, Atlanta, Ga., on duty at Camp Upton, N. Y., to Miss Corinne M. Cooke of New York City, May 16.

Jesse Willis Amey, New York City, to Miss Grace May Hoffman of Schenectady, N. Y., May 8.

Squire Wilbert Stone, to Miss Julia Louise Des Loges, both of New York City, May 21.

Thomas J. Cummins, Mineville, N. Y., to Miss H. Densey Mitchell of Baltimore, April 22.

Victor I. Englert, to Mrs. Cora Kors, both of Chicago, May 23.

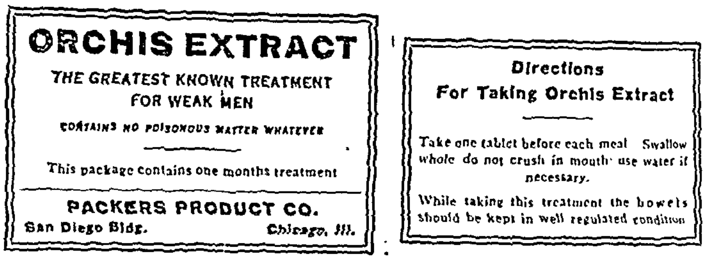
The Propaganda for Reform

In This Department Appear Reports of the Council on Pharmacy and Chemistry and of the Association Laboratory, Together with Other Matter Tending to Aid Intelligent Prescribing and to Oppose Medical Fraud on the Public and on the Profession

PACKERS PRODUCT COMPANY DECLARED A FRAUD

The Federal Authorities Close the Mails to a Fakish Concern

The Packers Product Company, San Diego Building, 311 River Street, Chicago, was the name under which one Fred A. Leach sold a nostrum, "Orchis Extract." The sales were made on the mail-order plan. In December, 1917, Leach was called on by the federal authorities to show cause why a fraud order should not be issued against his business and Jan. 10, 1918, was fixed as the date for the hearing. His attorney, Frank H. Repetto of Chicago, made application that the case be continued to January 14. On January 11 a written answer was submitted by the attorney accompanied by certain exhibits. These were carefully considered, together with the evidence against Leach. As a result the mails were closed to the Packers Product Company.



ORCHIS EXTRACT
THE GREATEST KNOWN TREATMENT FOR WEAK MEN
CONTAINS NO POISONOUS MATTER WHATEVER
This package contains one months treatment
PACKERS PRODUCT CO.
San Diego Bldg. Chicago, Ill.

Directions
For Taking Orchis Extract
Take one tablet before each meal Swallow whole do not crush in mouth use water if necessary.
While taking this treatment the bowels should be kept in well regulated condition

Reproduction in miniature of the labels on the boxes in which "Orchis Extract" was mailed.

Judge Lamar, Solicitor for the Post Office Department, in his memorandum to the Postmaster-General recommending the issuance of a fraud order, declared the facts regarding the Packers Product Company to be, in part, as follows:

A MISLEADING NAME

"The business complained of consists of the sale of a preparation known as 'Orchis Extract' by means of representations made through the mails in furtherance of a scheme to defraud. Fred A. Leach is the promoter of this scheme and operates it under the name Packers Product Company. This trade name was obviously selected and is continuously used for the purpose of leading persons to believe that they are dealing with a responsible concern engaged in the meat packing business and utilizing one of its by-products in the alleged manufacture of the aforesaid preparation which is offered to the public as a curative agent in cases of lost sexual power and kindred ailments. This purpose is clearly evidenced (1) by the name itself and (2) by the print of buildings and pens enclosing cattle on the back cover of the booklet and upon the form letters [See illustration accompanying this article.—Ed.] distributed to the public through the mails and carrying representations hereinafter referred to concerning the alleged curative properties of said preparation.

"The name 'Packers Product Company' is misleading for the reasons above set forth and the word 'manufacturers of Orchis Extract' are false, for the evidence shows that this respondent is not a manufacturer of this extract but the remedy sold by him and alleged to contain this substance is purchased by respondent from various manufacturing chemists. The print thus used with intention to mislead and thereby induce persons to purchase the preparation represents in fact some of the packing house buildings and slaughter pens of Armour and Company at Chicago, Illinois, in which this respondent has no interest and from which he buys none of the ingredients used in the compounding of the said preparation.

"'Orchis Extract' is said to be a substance obtained from the testicles of rams. A chemical analysis made by the Bureau of Chemistry of the Department of Agriculture shows that Orchis Extract Tablets, the preparation sold by respondent, consists of sugar of milk, orchitic animal tissue, and agents used in compressing the tablets."

FALSE AND RIDICULOUS CLAIMS

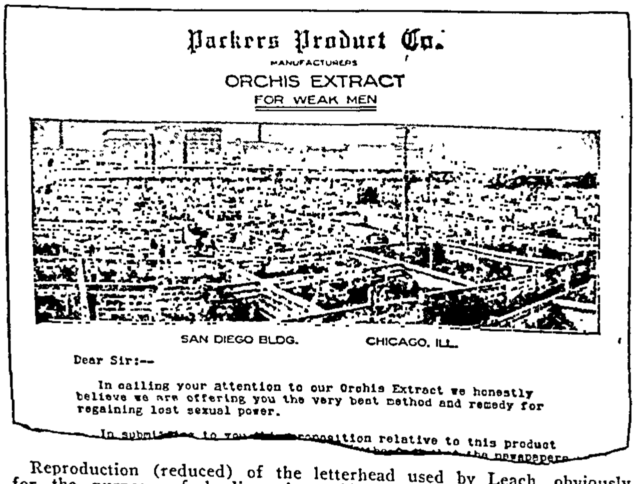
The Solicitor then quotes extensively from the advertising booklet sent out by Leach. Some of the characteristic claims follow:

> "Pre-senility, or premature old age, is a condition which can in most cases be relieved by a careful and conscientious treatment of Orchis Extract."
>
> "Orchis Extract has a special action on the glands of the reproductive organs."
>
> "Its action is that of a great vitalizer—tending to increase their activity, to aid their secretory functions and promote the normal development. It is specifically indicated in cases of atrophy of the private organ so common in cases of sexual abuses. Orchis Extract operates in a most remarkable manner in overcoming these conditions."
>
> "Orchis Extract, when introduced into the blood, should bring about a richer supply of blood so that the cold and shrunken parts of the body must return to vigor and vitality; ambition will be restored by stronger and healthier nerve tissues and muscles, and relief or a cure is sure to follow."
>
> "Orchis Extract is a reliable compound for restoring lost vitality, renewing cell life, resulting in restoring life, strength and development to the organs of man."
>
> "Orchis Extract is being successfully used in cases of Nervo-Sexual Troubles, such as Nervous Debility, Lost Manhood, Night Losses, and Undeveloped Parts. It is for the weak man, for the debilitated man, for every man who needs a reliable remedy to renew his life and vitality, enrich the blood, tone up the stomach and aid digestion, to soothe the nerves, to overcome vital exhaustion, to stimulate the liver and kidneys and to send new energy and new sustenance to every cell and tissue of the body. To nourish the brain, strengthen the memory and to renew life with health and strength."

WHAT THE EVIDENCE SHOWED

Judge Lamar's memorandum continues:

"The evidence shows the diseases and diseased conditions for which this remedy is recommended cannot be relieved or cured by its use; that the remedy taken internally can have no effect whatever on such diseases and diseased conditions, and that it is of no value in their treatment; that the condition known as 'Lost Manhood' may arise from various causes, and that no one remedy even if assumed to possess medicinal virtue could reach all of these various causes and relieve and cure the conditions arising therefrom; and that the respondent, unskilled in the science and practice of medicine, cannot determine the condition from which the patron may be suffering or its superinducing cause, and cannot unless by accident furnish a remedy that will give relief and effect a cure.



Packers Product Co.
MANUFACTURERS
ORCHIS EXTRACT
FOR WEAK MEN

SAN DIEGO BLDG. CHICAGO, ILL.

Dear Sir:--

In calling your attention to our Orchis Extract we honestly believe we are offering you the very best method and remedy for regaining lost sexual power.

In submitting to you the proposition relative to this product

Reproduction (reduced) of the letterhead used by Leach, obviously for the purpose of leading the public to think that the packers' (Armour's) whose plant is here shown, were behind the business. As a matter of fact, Armour's had repeatedly protested aganst this misuse of their name and were to no small extent responsible for putting the fraud out of business.

LEACH AN OLD OFFENDER

"Fred A. Leach, the promoter of this scheme, has been in the mail-order business from 15 to 20 years. The evidence shows that he was manager of the Distributors Guarantee Association, against which a fraud order was issued May 8, 1908; that he sold vacuum developers for the enlargement of the male organ under the name of the Vacuum System and David Kuno, Chicago, Illinois; that he also operated under the name of the Ausin System and E. D. Ausin, Chicago, handling vacuum developers, and that in 1912 and 1913 he sold vacuum developers under the name of Martin W. Wade and Wade Manufacturing Company, Chicago, Illinois.

"The respondent requests that he be allowed to continue the business in question using revised literature, and has indicated the revision intended by striking out certain parts of the literature now in use. Since the testimony shows that the preparation is of practically no value in the treatment of the diseases and conditions for which it is recommended, this request must be denied.

"The postmaster at Chicago, Illinois, reports that on an average 15 pieces of mail are daily received at his office addressed to this concern.

"I find that this is a scheme for obtaining money through the mails by means of false and fraudulent pretences, representations and promises, and therefore recommend that a fraud order be issued against the Packers Product Company, at San Diego Building and 311 River Street, Chicago, Illinois."

A fraud order was issued April 4, 1918.

Correspondence

BARBOUR'S LINEN FLAX THREAD AS A SUBSTITUTE FOR PAGENSTECHER THREAD

To the Editor:—As Pagenstecher thread, used by many surgeons in gastric and intestinal work, has not been imported for many months, the supply has become practically exhausted. It may be of interest, therefore, for those who have not found a satisfactory substitute, to know that Barbour's linen flax thread is stronger, smoother and a much better product than Pagenstecher linen. This material can be obtained in almost any size, at 18 cents per spool of 200 yards, as compared with 20 cents per skein of 50 yards for Pagenstecher thread (less than one quarter the price). No. 60 or 70 is a satisfactory size for intestinal work. The war has demonstrated that with little inconvenience we can dispense with practically everything we formerly used bearing the label, "Made in Germany," and linen thread for surgical work is no exception. I do not know where Barbour's thread is made, but believe it comes from Ireland. I do know, however, that it can be obtained in any department store.

Stephen E. Tracy, M.D., Philadelphia.

OIL INUNCTION IN PREVENTION OF PLAGUE: A SUGGESTION OF A CENTURY AGO

To the Editor:—Anent the article by Dr. George Homan in The Journal, May 11, 1918, on "Protection Against Lice," a quotation from an old book on "Plague and Yellow Fever" in my possession may be of interest. The title page of this book has been lost so I cannot give either the name of the author or the date of its publication; but from references and quotations it was probably printed about the year 1800 and it has the long f-like letter s. Under the head of the treatment of plague, on page 341, the author says:

> But of late a discovery has been made of a surprising power in heated oil of removing this disease, insomuch that, if we can believe what has been published of it, we must suppose it to be little less than a specific. So great indeed has been the confidence put in this method that, by order of the Academy of Sciences of Lisbon, it has been translated into Arabic, French and Portuguese.

Then follows a long extract from an Edinburgh medical journal, the *Annals of Medicine* for 1797, page 373, saying: "The method was first proposed by George Baldwin, Esq., agent of his Britannic Majesty, consol-general at Alexandria." Then follows a page of directions how to use oil by inunction in treating plague, and on page 343 is this statement:

> There is no instance of the person rubbing a patient having taken the infection. He should previously anoint himself all over with oil, and must avoid receiving the infected person's breath into his mouth

and nostrils. The precaution to be used in all circumstances is that of carefully anointing the body and living upon a light and easily digested food. Mr. Baldwin observes that among upwards of a million of people carried off by the plague in Upper and Lower Egypt in the space of four years, he could not discover a single oilman or dealer in oil.

Now that we know the rôle played by the bite of fleas and lice in causing plague, typhus and trench fever, reason would seem to justify the experimental use of oil by inunction in the prevention of these diseases.

S. W. Dickinson, M.D., Marion, Va.

CONTRIBUTIONS FOR BELGIAN AND FRENCH PHYSICIANS

To the Editor:—I beg to acknowledge the following contributions in money and instruments for the Belgian and French civilian doctors to aid them when they return to their devastated homes.

SUBSCRIPTIONS IN CASH

Dr. J. J. Edmonson, New York	$ 5.00
Dr. Clarence T. Faries, Narberth, Pa. (second, third and fourth monthly contributions)	30.00
Dr. Horace Gray, Camp Devens, Fitchburg, Mass.	5.00
Dr. William B. Reed, Rochester, N. Y.	10.00
Total	$50.00

INSTRUMENTS

Dr. John M. Ball, St. Joseph, Mo.; Dr. A. S. Doloff, Lewiston, Maine; Dr. J. Hall Allen, Philadelphia; Dr. A. F. Radzinski, Detroit; Dr. G. V. Janvier, Lansdowne, Pa.; Dr. DeWitt C. Rodenhurst, Philadelphia, N. Y.; one package of instruments, name of donor unfortunately mislaid; Dr. W. W. Keen, Philadelphia.

Messrs. Harvey R. Pierce & Co. have very kindly taken charge of the instruments and packed them carefully for shipment.

W. W. Keen, M.D., Philadelphia.

SIMPLE METHOD OF MAKING CURVED NEEDLES

To the Editor:—Owing to the scarcity of round curved needles, Langston Brothers, jewelers of Hamlet, N. C., have been making curved needles for the Hamlet Hospital by taking ordinary needles and bending them over an alcohol flame. This can be done by catching each end of the needles with a pair of pliers and gradually bending the needles over an alcohol flame. It takes about twenty seconds to make a curved needle out of a straight one.

W. D. James, M.D., Hamlet, N. C.
Surgeon in Charge, Hamlet Hospital.

Queries and Minor Notes

Anonymous Communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted, on request.

INSURANCE AND COMPENSATION

To the Editor:—May I ask you to describe the features of the insurance bill as it applies to medical men in active service? The points on which I should like information are the following: amount that must be carried; amount that may be carried; the rate—say at the age of 36—per thousand dollars. Does insurance remain in force after military service ceases; if so, how long? Does insurance entirely replace any other "pension" allowances to dependents in case of death? What provision is made for payment of "pension" in case of permanent or total disability incurred in line of duty? Please do not publish my name.

R. N. C., Cleveland.

To the Editor:—Will you please answer the following questions relative to the insurance and compensation law? Does Article II, relating to allotments and family allowances for enlisted men, apply to officers of the Medical Reserve? What is the cost of a $10,000 policy at the age of 45? Please omit my name.

E. L. S., Montana.

To the Editor:—Can a medical officer resign from the service after taking the oath? When does his pay begin? When does it stop? Will those in Europe be returned home or be discharged over there to make their way home the best way they can? Does the government give any form of insurance that could be collected in bulk so that the wife would have enough to do something with, or is it all on the monthly payment plan that would keep her practically a dependent pauper—a sum that no family could live on and have money to do anything with? Does an officer's family have any other allowance than his salary and commutation as do the privates? Will there be any insurance or pensions for officers' disabilities?

F. R. DeHoney, M.D., Fredericktown, Mo.

Answer.—Medical officers in active service may carry government insurance, but are not required to do so. They are allowed to carry from $1,000 to $10,000, the monthly rate on $1,000 varying as shown in the accompanying table:

Years.	Monthly Premium	Years.	Monthly Premium
25	$0.66	41	$ .82
26	.67	42	.84
27	.67	43	.87
28	.68	44	.89
29	.69	45	.92
30	.69	46	.95
31	.70	47	.99
32	.71	48	1.03
33	.72	49	1.09
34	.73	50	1.14
35	.74	51	1.20
36	.75	52	1.27
37	.76	53	1.35
38	.77	54	1.44
39	.79	55	1.53
40	.81		

In case of total or permanent disability the insured receives $5.75 per month per thousand dollars of insurance; this is continued as long as the insured lives or as long as disability continues. In case of death the beneficiary will receive $5.75 per month for 240 months for each thousand dollars of insurance less any payments made to the insured for total and permanent disability. The benefits are not paid in a lump sum. After the war the insurance is convertible, within five years, to any of the standard types of insurance, such as life, twenty payment life, or endowment. The premiums increase annually during the war as the age increases until the insured changes to one of the permanent forms, when the premium will depend on the plan then chosen. The permanent insurance after the war will be government insurance. During the war it will have no cash value or loan value, but the permanent insurance after the war will have such value. The insurance must be applied for within 120 days after entrance into active service.

In addition to the government insurance there is compensation payable to officers injured or disabled when on active duty. This is payable for death or disability resulting from personal injury suffered or disease contracted in line of duty, unless caused by the person's own wilful misconduct, the sum varying from $30 to more than $100 monthly, according to the number of dependents.

DICHLORAMIN-T

To the Editor:—In The Journal, April 27, 1918, p. 1212, appeared an article entitled "Dakin's Dichloramin-T Solution for Ocular Infections." 1. Please inform me as to where I can obtain this preparation. I have been using the Carrel-Dakin solution, but, as stated in the article, it is too irritating, and I should like to try this preparation. 2. Please inform me as to the method of preparation, and what oil it is put in. 3. What is the meaning of the "T."

D. M. Randel, Muskogee, Okla.

Answer.—Dichloramin-T may be obtained from the Abbott Laboratories, Chicago, the Calco Chemical Company, Bound Brook, N. J., and the Monsanto Chemical Company, St. Louis (see New and Nonofficial Remedies, 1918, p. 159 and the N. N. R. department of The Journal, April 6, 1918, p. 999).

2. For use, dichloramin-T is dissolved in chlorinated eucalyptol, and this solution is diluted with chlorinated paraffin (see New and Nonofficial Remedies, 1918, p. 80), or the dichloramin-T may be dissolved in chlorcosane (see the N. N. R. department of The Journal, Feb. 16, 1918, p. 459, and May 18, 1918, p. 1459).

3. Dichloramin-T is the parasulphonedichloramid of toluene; the "T," for "toluene," distinguishes it from similar compounds that have been or may be made from benzene, xylene, etc.

SANATORIUMS THAT CARE FOR PATIENTS WITH TICS

To the Editor:—Please give me the names and addresses of sanatoriums that have had particular success in caring for patients with spasmodic functional tics.

X. Y. Z.

Answer.—The Journal will be glad to hear of institutions, preferably in the West, that are fitted to care for cases of this character.

Removing Superfluous Hair with Electric Needle Is Practicing Medicine

(Engel v. Gerstenfeld (N. Y.), 168 N. Y. Supp. 434)

The Supreme Court of New York, Appellate Term, Second Department, reverses a judgment obtained by the plaintiff for a balance claimed to be due for the removal with the electric needle of superfluous hair from the face of the defendant's niece, a Miss Abrams, because the plaintiff, not being a licensed and registered physician, in undertaking to treat Miss Abrams for the growth of hair on her face, violated the provision of the public health law regulating the practice of medicine. Justice Benedict holds that, as the plaintiff committed a misdemeanor in undertaking to treat the "deformity" or "physical condition" of the skin of Miss Abrams, the plaintiff was not entitled to recover in this action. Justice Clark concurs in the result, on the ground that the plaintiff practiced medicine, in that, following the definition of the statute, she held herself out as being able to diagnose, treat, and operate for a certain physical condition, and undertook to diagnose, treat, and operate for such physical condition. Justice Callaghan dissents.

Justice Benedict says the "practice of medicine" is defined in the statute as follows:

> A person practices medicine within the meaning of this article, except as hereinafter stated, who holds himself out as being able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake, by any means or method, to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition.

The growth of hair on Miss Abram's face when she went to the plaintiff was a "deformity" or a "physical condition," of which she, or the defendant, desired the aid of the plaintiff in the treatment and cure; and the plaintiff clearly held herself out to them as being able to treat it successfully, and did undertake to treat it with an instrument known as an electric needle. The statute plainly means that a person holds himself out as being able and willing to diagnose or treat any human disease or "deformity" or "physical condition" when he represents or states to a patient that he possesses the skill or ability requisite for the case. It is not essential that the "holding out" should be by way of public announcement. If there be a "holding out" of oneself as willing to undertake the treatment and able to administer it, then it follows that this constitutes the practice of medicine within the terms of the statute. Nor can it be said that the removal of hair from the face of a woman by the use of an electric needle does not properly come within the category of the practice of medicine any more than the removal of hair from the face of a man by the use of a razor would. Bouvier's Law Dictionary, speaking of surgery, says, "The practice of surgery is limited to manual operations usually performed by surgical instruments or appliances." The use of an electric needle would obviously come within this definition.

The definition of the term "practice of medicine" contained in the statute may be thought by some persons to be highly artificial. It includes, and was designed to include, many things not popularly considered as medical practice. But the wisdom of the law, if it be constitutional, is a matter for the consideration of the legislature and not of the courts. It may well be argued that four years of medical study, including a thorough knowledge of anatomy, materia medica, hygiene, etc., in all their branches, are not requisite to equip a person properly to remove superfluous hair alone. Yet it can hardly be contended that persons engaging in that occupation should be subject to some sort of regulation to insure proper skill and sanitation, such at least as the regulations affecting the practice of chiropody. The legislature has seen fit to set a much higher standard, and until the statute herein discussed is amended or abrogated, the courts have no discretion but to enforce it.

ASSOCIATION OF AMERICAN PHYSICIANS

Thirty-Third Annual Meeting, Held at Atlantic City, N. J., May 7-8, 1918

Dr. F. H. Williams, Boston, in the Chair

Instructions in Treatment

Dr. F. H. Williams, Boston: The young practitioner has many difficulties in adapting the details of pharmacology and therapeutics to practice. Students should be taught by men with long clinical practice and in that way learn to bridge the gap between materia medica and therapeutics, on the one hand, and the practice of medicine on the other. More opportunities for bedside instruction should be offered. The student should be taught when to give powerful remedies and when not. The man who brings sleep to the patient without resorting to hypnotics, or alleviates pain without prescribing morphin, who, in other words, accomplishes results by simple means, is learning to be master of his art.

Intravenous Use of Arsphenamin in Syphilis of the Nervous System

Dr. Bernard Sachs, New York: Four hundred patients were treated intravenously with the Philadelphia preparation of arsphenamin, which has proved entirely satisfactory. I am convinced that much good will be accomplished by the intravenous treatment, which is safe in the hands of the majority of physicians. All biologic tests must be used as corroborative evidence, and clinical evidence must not be disregarded. The lack of serologic evidence does not always disprove syphilis, nor is there a parallel between clinical symptoms and serologic findings, as remissions are often observed without serologic change, and serologic improvement is not always accompanied by clinical betterment. It is only in types with vascular lesions that the clinical findings and serologic tests progress *pari passu*. In general paresis and tabes, the chief lesions are deep in the brain and cord, far removed from the spinal fluid, and only to be reached by the blood stream. In the meningomyelitic type of involvement it is impossible for the curative substances to remain in the fluid long enough to do any good. I do not hold the doctrine of the impermeability of the choroid plexus. The pressure in the cerebral capillaries being higher than in the fluid, a metallic substance like arsphenamin is rapidly absorbed into the venous system. Why, therefore, should not the venous system be used at once? Intraspinal medication is theoretically and essentially unsound. It is fatal to the syphilitic organism, but frequently also to the patient. Early and intensive treatment is necessary, a dose being given every other day for from four to six weeks, followed by a period of complete rest. Forty or fifty injections may be required within a year. It would be impossible to introduce toxic substances so frequently into the canal. No claim can be made for the cure of tabes dorsalis or general paresis by the intraspinal method; the most that can be said is that remissions may be longer. It is urged that treatment be begun as early as possible and continued for years after the initial lesion, and that the patient be kept under medical control for as long as necessary. The hope of the future lies in the discovery of a substance less toxic than arsphenamin with which a more intensive treatment can be undertaken.

DISCUSSION

Dr. S. J. Meltzer, New York: In regard to the permeability or impermeability of the choroid plexus we have no exact knowledge. Benedict found arsphenamin (salvarsan) in the spinal fluid, but no doubt not in such quantities as if injected intraspinally. Swift's work was conservative, and he never overemphasized his claim. He used not merely arsphenamin, but arsphenamized serum. Is there any objection to giving intraspinal treatment at the same time as intravenous, provided it does no harm? With meningitis both intravenous and intraspinal injections should be used.

Dr. William H. Park, New York: In regard to tetanus antitoxin, one can absolutely show that the intraspinal injection will protect and cure, while the intravenous alone will not. The two are given simultaneously.

Dr. Bernard Sachs, New York: In reply to Dr. Meltzer as to why I do not advocate the combination of the intraspinal and the intravenous methods, I have distinct experience of the far more dangerous character of the intraspinal medication. I have seen immediate paralyses ensue, and cases in which rectal and vesical control have become markedly impaired. With the use of the intravenous treatment I have kept a patient over ten years in a very comfortable condition.

Relation of the Chemical Structure of Opium Alkaloids to Their Action on Smooth Muscle and on the Pharmacologic and Therapeutic Properties of Some Benzyl Esters

Dr. D. I. Macht, Baltimore: I have made an intensive study of the alkaloids of opium in connection with morphin. A marked difference exists in the alkaloids of the two products. The alkaloids of opium act on the central nervous system, on peripheral structures, and on smooth muscle. The effect of morphin is increased tonicity, that of papaverin, relaxed tonicity and inhibition of contractions. Thus the latter preparations (papaverin alkaloids) can be used for expulsion of renal calculi, by relaxation of the ureteral muscle. Search was made for nontoxic products, and benzyl benzoate and benzyl acetate, very slightly toxic products, were found, giving the effects of papaverin. Metabolic studies showed that benzyl acetate was excreted by the kidneys as hippuric acid. This is nontoxic and can be administered by mouth. It has been tried clinically, but the disagreeable odor and digestive disturbance after its use contraindicate its use. Benzyl benzoate was then tried. It was found to be of use in cases of excessive peristalsis, in diarrhea and in dysentery. A 20 per cent. solution in alcohol was used. Other indications are in pylorospasm, intestinal colic, spastic constipation, biliary colic, ureteral calculi, vesical spasm, spasm of seminal vesicles, uterine colic, arterial spasm, high blood pressure and lastly bronchial spasm with true asthma, in which remarkable relief was afforded. Benefit occurs by relaxation of spasm.

Use of Benzyl Alcohol as a Local Anesthetic

Dr. D. I. Macht, Baltimore: In testing the taste of the drug, it was found that a drop on the tongue produced numbness, and experiments proved that this agent produced anesthesia of the sensory nerve endings. Benzyl alcohol possesses only slight toxicity. It is found in balsam of Peru and Tolu and is known as phenmethyl-O. The boiling point is very high. It is soluble up to 14 per cent. in water, at room temperature. All the solutions used in the clinic were from 0.5 to 4 per cent. Other effects are sensory nerve paralysis; corneal anesthesia; blocking of nerve fibers, first sensory, then motor; effect on blood pressure (the heart not being affected at all), and a slight sedative effect on the central nervous system. The toxicity as compared with cocain shows that 20 c.c. injected into an animal gives no effect, whereas 20 mg. of cocain injected kills an animal. It has been tried out in the clinic with marked success. The anesthesia was found to be fully that of cocain. A bullet was extracted without pain; ingrowing toenails were excised; complete excision of hemorrhoids and excision of rectal fissure were painlessly performed.

DISCUSSION

Dr. S. J. Meltzer, New York: Has Dr. Macht studied only smooth muscle or has he also experimented with papaverin on striated muscle? What are the effects on the central nervous system? Does the papaverin group increase the inhibitory side of the nerve effect, or are the phenomena of the opposite nerves reduced?

Dr. T. R. Brown, Baltimore: In cases of increased irritability of the gastro-intestinal tract, associated with diarrhea and mucous colitis, the symptoms are very greatly relieved by the benzyl esters.

Dr. S. Solis Cohen, Philadelphia: I have found benzyl benzoate of value in the treatment of various forms of asthma with dyspnea and in arteriosclerosis with excessively high blood pressure. It is of great use in a particularly irritating cough, known in Philadelphia as "Hog Island Whoop." In cases in which one does not care to use morphin, benzyl benzoate is a distinct palliative.

Dr. Alfred H. Hess, New York: I have used papaverin in pylorospasm with good result.

Dr. D. I. Macht, Baltimore: I believe that the papaverin group exerts its action peripherally. This is the therapeutic action of all papaveraceae. Benzyl esters act on the central nervous system. The peripheral effect on smooth muscle predominates, however. In regard to the toxicity of the benzyl esters, the herbivorous animals apparently can stand much larger doses and can metabolize them better than carnivorous animals.

Acute Pancreatitis in Typhoid

Dr. Thomas McCrae, Philadelphia: The case ran an ordinary course, the temperature being normal on the twenty-fourth day. On the twenty-sixth day the patient complained of pain in the upper right quadrant, there was jaundice, and the leukocytes numbered 20,000. Two or three days later the pain subsided and the leukocytes numbered 10,000. Eleven days later there was a definite mass in the region of the gallbladder, somewhat tender, and a diagnosis of cholecystitis was made. The next day the pain was very severe and bloody stools were passed, blood was present in the urine, and large amounts of blood were vomited. The leukocytes numbered 26,000. The symptoms subsided for a time when the pain again increased. On the fifty-fourth day of the illness an operation was performed. It was found that the gallbladder, duodenum, stomach and bile ducts were normal. The pancreas was swollen and inflamed. The abdomen was closed and the patient made a good recovery, and in three weeks the mass disappeared. On the eighty-second day he was discharged perfectly well. Points to be observed in this case were that there was very little fever, never complete stoppage of bile, and the stools showed no evidence of pancreatic disease.

DISCUSSION

Dr. Emanuel Libman, New York: I have seen this picture in cases in which I suspected a mild form of pancreatitis. A certain form of pancreatitis occurs in acute infectious diseases and in suppurative conditions after abdominal operations. The diagnosis of acute pancreatitis is not so difficult as it is supposed to be. In these cases there is tenderness of the left lumbar region, marked even in patients not sensitive to pain. This question of the relative sensitiveness of the patient to pain is important. Pain is much more apparent in some patients than in others. In acute pancreatitis the pain on the left side can always be elicited, and this is found in no other condition.

Dr. Thomas McCrae, Philadelphia: There was no tenderness in the left lumbar region in this case. A careful examination was made because when the hematuria appeared it was thought that there was a condition in the kidney producing this symptom.

Clinical Manifestations of Tropical Sprue

Dr. E. J. Wood, Wilmington, N. C.: There has been a great increase in the number of cases in North Carolina, South Carolina and Georgia. I have seen cases of tropical sprue from the East and from Porto Rico, as well as Southern cases. There is only one type in all cases. Sprue is often confused with pallagra. It is no doubt true that many cases of pellagra are complicated by sprue. Sprue needs special attention at this time because it has appeared near many of the Southern cantonments. The symptoms appeared first in the tongue, in the form of small, painful erosions. In the diarrhea of sprue the feces are tremendously acid in reaction, are yeasty, and are passed during the early morning hours. They show tremendous loss of fat, as much as 59 per cent. The nitrogen loss is 15 per cent. Functional deficiency of the pancreas is evident in most cases, but not all. Anemia in sprue is an essential feature. The absence of anemia in pellagra is a distinguishing feature. In sprue the anemia appears similar to pernicious anemia. Shrinkage of the liver is seen in both conditions. The stomach content changes are fairly similar in both diseases and show a decrease in hydrochloric acid. The beef treatment of Cantley has been found the best means of therapeusis.

DISCUSSION

Col. William H. Welch, M. R. C., Baltimore: I have found buccal lesions and gastro-intestinal lesions which might be referable to sprue. I should like to know to what extent pellagra is complicated by sprue. Goldberger's work would seem to show that this is one of the most difficult and perplexing questions. Not a single case of pellagra has been found to develop when the diet has been properly supplemented.

Dr. Alexander McPhedran, Toronto: A few years ago I saw a woman who returned from India much affected. Her condition was grave, with extreme anemia, but there was no material loss of weight. Diarrhea was marked. The tongue had a rather glazed, smooth appearance. She had recurrent attacks of vesicular stomatitis. No treatment produced any effect until she tried the strawberry diet, three or four pounds a day, and she improved on that and for two summers was greatly improved. Two years later she became pregnant and had a marked mitral stenosis. It was believed best to do cesarean section three weeks before term. The child was viable. She did well for a few days, but then developed sepsis and died.

Dr. S. Solis Cohen, Philadelphia: A teacher returned from Porto Rico with an undoubted case of sprue. She showed marked nervous and mental symptoms. British writers advocated treatment by old santonin. This patient received this treatment and recovery followed. Is that the general experience?

Dr. T. R. Brown, Baltimore: I have seen two cases from Porto Rico. The stomach contents showed complete achylia. Under treatment the stomach contents returned to normal as regards hydrochloric acid.

Dr. E. J. Wood, Wilmington, N. C.: The point to decide is, When does sprue begin to complicate pellagra? The pellagra tongue has a different appearance, being a much deeper red, this being accompanied with profuse and painful salivation. In sprue the tongue is furred and dry because of the absence of salivation. The intake and the output of nitrogen in pellagra are normal. Pellagra is a seasonal disease running from May to August. In sprue the diarrhea, instead of ending, continues. Anemia is not associated with pellagra, but in sprue it is essential for diagnosis. In answer to Dr. Libman, there is an absolute absence of hydrochloric acid in sprue. In regard to the nervous disturbances mentioned by Dr. Cohen, these disturbances are marked in pellagra and perhaps the case mentioned was really pellagra and not sprue. The strawberry diet has not been found to be of any service. Santonin and emetin have been discarded as worthless. No treatment except dietetic control and rest for a prolonged period has been found of any avail.

1. **Surgical Shock and Some Related Problems.**—Sweet defines shock as a condition marked by a gradual progressive fall of blood pressure with no obvious cause, such as hemorrhage, intracranial pressure or heart failure. He believes that it is due to a paresis or paralysis of the musculature of the arterioles. The only way in which Sweet has been able to experimentally produce anything which looks like shock to him is by the removal of the suprarenals. After the removal of the suprarenals the content of the intestinal tract contains a poison identical with, or at least similar to, the poison found in high obstruction, which suggests a possible relation between high obstruction and the suprarenals. Speaking of blood transfusion Sweet says: Let us think for a moment of what the blood is and does and let us begin by getting out of our heads the idea that the blood is that vital life-giving fluid which can be cleaned by a spring tonic or which can become diseased with any result, from pimples on the face to cancer of the uterus. The blood is just about as vital as a bucket of water and just as full of life. It contains and carries to the tissues just what and only what the tissues put into it. It is a purely passive, inert, lifeless stream, carrying canal boats loaded with goods, the red cells, themselves again passive. The red cells are alive, but only mildly so, and no more so than certain chemical agents, sponge platinum for example. The white cells are alive in a more real sense, but they are not in the blood stream because the blood stream wants them; they were merely playing on the bank and fell in. Sweet says he has the highest respect for it as a common carrier, no respect at all for it as an active agent, endowed with a free will; and because he feels as he does toward the blood, he fails to see that a transfusion can ever be much more than a symptomatic treatment.

3. **Prognosis of Gallbladder Infections.**—Gibbon believes that the mortality in gallbladder infections depends very largely on whether or not a cholangeitis is present, and that a persistent jaundice accompanied by general symptoms of sepsis is of grave import and calls for prompt drainage through the gallbladder or common duct, or both; that a patient having undoubted symptoms of gallbladder infection should not be allowed to postpone operation until an acute exacerbation of the infection occurs; that even far-advanced and neglected cases of infection of the gallbladder alone give good results following operation; that jaundice due to stone in the common duct in the absence of symptoms of sepsis is not necessarily a grave symptom if prompt operation is done; that the high mortality following operations occurs in the cases of long-standing gallbladder symptoms with acute exacerbation of the infection and in cases of malignancy of the gallbladder and pancreas; that the use of horse serum has practically eliminated the danger of hemorrhage due to long-standing jaundice, and that the recurrence of gallstones after thorough operation is extremely rare.

5. **Cardiac Syphilis.**—Moore insists that cardiac complications during syphilis occur much more frequently than has been recognized generally heretofore. The cardiac lesions occur earlier in the disease than has been thought, even in the early secondary stage. Congenital syphilis of the heart is a cause of sudden death in early life, this condition being unsuspected clinically, as a rule. The nature of the process in the heart is distinct and may be recognized microscopically, and the spirochetes may be found in the lesion; it is most frequently a myocarditis. Uncomplicated aortic insufficiency is of syphilitic origin in the majority of instances. The symptoms are not definite but extremely suggestive; the diagnosis depends mainly on the signs of some cardiac disorder, with a positive Wassermann, and a response to antisyphilitic treatment. The prognosis is good in the early stages and varies directly with the stage of the disease and the extent of the changes produced. Treatment should be mainly antisyphilitic intensive. Cardiac treatment is required rarely except in cases with decompensation. Once instituted treatment should be carried through persistently and unteruptedly.

13. **Operation for Prolapse of Uterus.**—All or any of the steps of Ries' operation are used according to the findings. Assuming a case of a multipara who does not insist on further offspring, the vagina is disinfected with compound solution of cresol, and the external skin with iodin or acetone alcohol. The bladder is catheterized. The cervix is pulled down, is disinfected, and volsella are placed just below the external meatus, one far out on each side of the vagina. A piece of vagina the size of which depends on the amount of redundant vaginal tissue is dissected off. The edges of the vagina are then lifted up and dissected farther away from the bladder so that the lateral attachments of the bladder are freed. Then the ligamenta pubovesicalia, where distinct, are separated from the bladder a short distance and the bladder is pushed away from the uterus clear up to the peritoneum, but the peritoneum is not opened. Now the first sutures unite the ligamenta pubovesicalia below the bladder where they are well pronounced. The next line of continuous sutures grasps the vaginal wall and where the urethra is not firmly fixed, the urethra. At the end of the urethra this suture is tied. From there on a continuous suture unites vaginal wall and fastens it at the same time to the cervix so that a deep anterior fornix of the vagina is created. Coming close to the lower end of the cervix the line of incision is drawn into a transverse line and the suture made across the cervix. This finishes the work on cervix, urethra and anterior vaginal wall. The bladder has not been sutured so far at all and it lies temporarily above the anterior fornix of the vagina and any oozing from it will accumulate in this space between the peritoneum above and the vagina below.

The operation for the rectocele is now begun with a Hegar triangular denudation, the rectum is separated from the vagina so far as necessary and by blunt dissection of the levator muscle is laid bare on both sides. The attachment of the pubococcygeus behind the anus causes the posterior circumference of the anus to move if the freed levator is pulled on. Three or four sutures unite the edges of the levator. Then a point as much below the apex of the triangle as necessary in each case is pulled up and a suture made which distorts the upper end of the triangle into a two-pronged suture line, the two prongs lying in the posterior sulci of the vagina. The rest of the perineal plastic is done in the usual way. Skin sutures are made with celluloid linen, everything else with plain catgut. The perineum is covered with pertrolatum as the only dressing. The abdomen is entered and the uterus exposed. Sterilization Ries accomplished by excising the tube out of the uterine horn in wedge shape. The gap in the uterine horn is sutured over by a special suture or this suture is done together with the next step of the operation.

The edge of the peritoneum of the bladder is pulled as high up on the uterus as the tissue will allow, thereby taking the slack out of the posterior vesical wall and fastening the posterior bladder wall high up on the uterus. This peritoneum and bladder is sutured to the fundus of the uterus and the stitches which fasten it can be utilized to close the gap in the uterine horn if this has not been done previously. If the symphysis has been found bare, the anterior wall of the bladder is pulled up and stitched to the posterior aspect of the rectus muscles as high as the slack permits. Next the parietal peritoneum is sutured to the posterior surface of the uterus below the fundus so that the fundus is extruded from the peritoneal cavity, and the suture of the parietal peritoneum is completed. The rectus muscles or sometimes the fascia are sutured to the extruded fundus. The muscles and fascia are then united in the ordinary way and the skin sutured.

18. **Blood in Eclampsia.**—Analysis of the blood in cases of eclampsia and allied intoxications revealed a normal quantity of amino acids and a slight retention of nitrogenous waste products, as urea and uric acid. After convulsions there is an increase in the blood sugar. The total fat is approximately the same in cases of toxemia and of normal pregnancy. Usually the cholesterol is increased and the lecithin diminished in eclampsia. The carbon dioxid combining power of the plasma is reduced during normal pregnancy, indicating a mild acidosis, and the variations met with in the presence of autointoxications are insignificant. Slemons says that the results of blood analysis do not support the acidosis hypothesis nor the derangement of protein metabolism hypothesis of eclampsia and indicate that the cause of the disease must be sought elsewhere.

43. **Ruptured Ectopic Pregnancy—Blood Transfusion and Pulmonary Embolism.**—When first seen six hours after onset of symptoms Shier's patient presented the signs of abdominal hemorrhage. The history and patient's condition quickly led to a diagnosis of ruptured ectopic pregnancy. She was pulseless, her pupils dilated and altogether not at all encouraging. The abdomen was opened and found full of blood and clots. The ruptured tube was easily located, its pedicle clamped and tied off. Pituitary extract 1 c.c. was given. The abdomen was made reasonably free of blood and clots and the incision closed, drainage being provided by two rubber tubes passing down to the pelvis. The patient was returned to bed with the foot elevated. About two hours later, Shier transfused her from her husband, a healthy robust man. About 750 c.c. of blood was used. The sodium citrate method was followed. The usual signs of improvement after transfusion followed, and from then on the patient made an uninterrupted recovery until the morning of the twelfth day, when suddenly, while in conversation with the nurse, she was seized with a fainting spell and gasped for air. Collapse followed immediately, the pulse dropped to 70 and was very weak. She was cyanotic and suffering from dyspnea. She had no pain but her pulse was now 140. Shier suspected pulmonary embolism and gave stimulants and fresh air in abundance. In a few hours time the cyanosis lessened, but the pulse remained fast and the dyspnea increased. The respiratory rate reached 58 to 60 at times. The air hunger was extreme. Her condition remained much the same for thirty-two hours when death came through gradual cardiac failure.

64. **Autohemagglutination Induced by Repeated Withdrawal of Blood.**—The influence of repeated bleedings on the normal isohemagglutinins was investigated by Robertson and Rous. They found that the repeated withdrawal of moderate quantities of blood does not lead to a development of new isoagglutinins in rabbits, or to noteworthy changes in normal ones already present. On the other hand, clumping of the animals' own cell in specimens of the whole blood is a frequent result. It is found in animals rendered anemic by the bleedings, not in those that rapidly repair their losses and remain in good condition. A similar clumping is sometimes to be seen in the blood of rabbits rendered anemic by malnutrition. The clumping is due to a true auto-agglutinin, which differs from the normal auto-agglutinin in its far greater strength, as also, at least in some instances, by a peculiar variation in its activity with changes of temperature. In the rabbits which developed iso-agglutinins after bleeding, the tendency of the cells to form rouleau was far less than the normal. It follows that rouleau formation is not essentially connected with auto-agglutination, as has been assumed in the past. The authors suggest that in the light of these findings a systematic search for autohemagglutinins in the blood of anemic patients would seem of interest.

65. **Operations on Abdominal Aorta.**—From the results of the five experiments presented by Goodman there seems to be no difficulty in correcting injuries of the abdominal aorta in dogs, with subsequent perfect restoration of the continuity of the vessel. The complete occlusion of the aorta for a period of thirty minutes is not necessarily followed by serious consequences. For lateral defects in the aorta, or for injuries not involving the entire circumference, a rectangular clamp may be applied for a prolonged period in order that the circulation should not be completely cut off. An operative field free from blood can thus be obtained while the circulation is maintained through the remaining lumen of the aorta. In the instances in which a portion of the aorta must be resected, an arterial segment taken from another animal can be safely utilized as a transplant. Smaller vessels can be adapted to the caliber of the aorta by the following procedure which was devised by Jeger and Helmuth Hosef. While the reestablishment of the continuity of the severed aorta by the circular suture is possible, the approximation of the severed ends during the suture entails such injury that thrombosis frequently occurs. Therefore, when the aorta is completely severed, the introduction of a transplanted segment is indicated. An arterial tube of increased caliber made of smaller vessels such as the carotid lends itself readily as a transplant to the severed aorta, with a reasonable assurance of reestablishing the continuity of this vessel. Defects in the aorta can be readily corrected by the use of fascial transplants with minimum danger of thrombosis.

67. **Cultural Conditions of Leptospira Icterohemorrhagiae.**—Noguchi claims that the presence of suitable animal or human serum is essential for the cultivation of *Leptospira icterohemorrhagiae*. A luxuriant growth takes place in a medium of Ringer's solution to which more than 10 per cent. of normal rabbit serum is added. The use of an undiluted serum offers no advantage over a diluted one, provided the latter contains at least 10 per cent. of serum. In the case of certain animal serums dilution seems to make them more suitable for cultivation purposes, owing perhaps to its reduction of their inherent alkalinity. The reaction of the medium is an important factor in the cultivation of the organism, which thrives most vigorously in a medium of which the reaction is slightly alkaline, not exceeding that of the serum. Three different media are described by Noguchi for the cultivation of freshly isolated strains. After prolonged cultivation on these mediums a strain may be readily cultivated in a serum diluted with Ringer's or isotonic salt solution.

68. **Survival of Leptospira Icterohemorrhagiae in Nature.**—The larvae and adults of the Culex mosquito, the larvae of the house fly and bluebottle fly, wood ticks (*Dermacentor andersoni*), and leeches failed to become carriers of the spirochetes when fed on infected guinea-pigs or their organs; they cannot play the part of an intermediary host of *Leptospira icterohemorrhagiae*.

69. **Hypochlorite and Chloramin-T Solution.**—Exact determinations of the rapidity of the fall in chlorin concentration on pathologic and on normal skin, under experimental conditions were made by Austin and Taylor because they might be of value to surgeons using Dakin's hypochlorite and chloramin-T solutions clinically. The left ears of three white rabbits of the same relative size and weight were exposed to the rays emitted by a Coolidge tube. The spark gap used measured 3 inches; the milliamperage was 110; the distance from the target to the ear was 6 inches; and the time of exposure was twenty minutes. Eight weeks later the roentgen rayed ears each exhibited a sharply demarcated gangrenous area over which there was considerable crusting of epithelium and secretions and in the lumen there was much thick pus. The ears of the affected rabbits were each suspended for twenty minutes in a beaker containing 400 c.c. of the solution to be tested.

The fall in chlorin concentration of Dakin's hypochlorite solution was more rapid in contact with necrotic than in contact with normal tissue. The fall in chlorin concentration of chloramin-T solution was very slight when applied to necrotic tissue and is negligible when applied to normal tissue. The action of the hypochlorite solution on tissue resulted in the separation of particles of necrotic tissue, hair, epithelial scales, coagulated serum, etc., and a gradual digestion of these substances, taking place over a period of at least seventeen hours. The fall in the chlorin concentration of hypochlorite solution was not complete until the particles were completely dissolved. Chloramin-T solution, 2 per cent., had no erosive effect comparable with that exhibited by the hypochlorite solution. Repeated exposure to the three solutions showed that the hypochlorite solution was superior in its cleansing ability on necrotic tissue. The hypochlorite solution was much more irritating to normal rabbit skin than chloramin-T solution or the alkaline control solution. Therefore, the authors conclude that irritating effects must be due to the readily available chlorin.

70. **Toxicity of Certain Antiseptics.**—The toxic action of a number of antiseptic substances in common use was investigated by Taylor and Austin. The method was to inject increasing doses into mice intraperitoneally and into guinea-pigs both subcutaneously and intraperitoneally. The only antiseptic of which the smallest fatal dose was smaller than the largest survival dose was dichloramin-T. Since two mice survived 4.7 mg. per 100 gm. of body weight, it is probable that 15.5 mg. rather than 1.6 mg. is to be considered the smallest fatal dose for this series. Of all the substances tested, eucalyptol and brilliant green were the most toxic, the lethal dose of each being 0.1 mg. per 100 mg. of body weight. Mercurophen, mercuric chlorid, and chloramin-T constitute the group with the next highest toxicity, the lethal dose being 1 mg. per 100 gm. of body weight. Dichloramin-T, proflavine and the four hypochlorite solutions tested follow in the order named with a lethal dose of about 10 to 15 mg. per 100 gm. of body weight. The least toxic chemicals are iodin and phenol, of which the lethal doses are about 50 mg. per 100 gm. of body weight. The lethal dose of the Dakin's hypochlorite solution injected under the skin of the

abdomen of guinea-pigs per 100 gm. of body weight is the same as that determined intraperitoneally in the mouse. Chloramin-T and dichloramin-T administered in this manner gave rise to local necrosis with extensive sloughing. Therefore, the substances injected intraperitoneally into mice and guinea-pigs arranged in the order of their decreasing toxicity are: eucalyptol and brilliant green; mercurophen; mercuric chlorid and chloramin-T; dichloramin-T and proflavine; hypochlorite, Dakin's hypochlorite, Javelle water, and magnesium hypochlorite, iodin and phenol. Now that Dakin's bland solvent, chlorcosane, is available as a vehicle for dichloramin-T, the authors advise that eucalyptol should be discarded for this purpose because of its much greater toxicity.

76. **Electro-Operative Bone Clamp.**—Albee has devised an electrically driven bone clamp for use in difficult cases, in conjunction with the traction table, although it has been found that the clamp can be successfully used alone and is a most powerful instrument per se. In several instances of malunited fracture of the femur of several months' duration and with two thirds inches of shortening (overriding), the fragments have been easily and quickly distracted and brought into alinement with little muscular exertion on the part of the operator for the reason that all the energy has been expended on the bone fragments themselves.

1. **Vaginal Douching.**—Fothergill says the vaginal douche can has, on the whole, been a curse to womankind rather than a blessing. Just as there was a pessary age, characterized by the haphazard use of pessaries in the treatment of the minor ailments of women, so there has been a long period of indiscriminate douching which has not yet reached its belated end. For a time douching remained under the control of the medical profession; but then the general public began buying douche cans on its own account, and the pernicious but apparently seductive habit of antiseptic douching is now generally begun on the advice of an elderly relative. Every patient who complains of minor pelvic ailments should be asked whether she douches or not; and, if she says "Yes," should be told to stop it. The vaginal surface has no glands, and is not a mucous membrane, but is covered by stratified squamous epithelium, which, though very strong and resistant to infection, is, so to speak, not quite waterproof. Thus the vaginal secretion is simply serum which exudes from the surface of the squamous epithelium, and which acquires its normal creamy appearance by admixture with leukocytes and epithelial débris. Sliminess of the vaginal discharge is due to an excess of mucus which comes from the lining of the uterus and not from the vaginal wall. The normal vaginal secretion is definitely acid in reaction, and this acidity inhibits the life of most septic and pathogenic organisms. Thus the normal content of the vagina is a barrier to ascending infections, and it is generally sufficient to protect the uterus.

Douching does actual harm, for it washes away the normal acid secretion; kills the acid-producing bacteria which are the normal inhabitants of the vagina; kills the superficial layers of cells, and irritates the subjacent layers. Further, it promotes hyperemia of the parts, and thus increases the quantity of the secretion, favors menorrhagia, congestive dysmenorrhea, and intermenstrual congestive pain. This explains the fact that the woman who douches much never gets rid of her vaginal discharge, and generally has other complaints in addition. In septic infection of the uterine cavity after abortion or labor, vaginal douching clearly does not touch the spot at all, and intra-uterine douching is positively dangerous, as it sometimes causes fatal peritonitis by forcing septic material and noxious antiseptics through the tubes into the peritoneal cavity. The proper way to treat uterine sepsis is to dry clean the uterine cavity thoroughly, using a general anesthetic if necessary; to apply concentrated antiseptics with no excess of fluid; and thereafter to leave the uterus and vagina severely alone. In gonorrheal infection of the vulva the infection is very likely to be carried up through the vagina to the cervix, whence the gonococcus has a clear run over the mucous lining of both uterus and tubes. When the cervical canal is once infected, douching is futile, and proper disinfection under anesthesia is the only method likely to be effective.

Though antiseptic and medicated douches might well be dispensed with altogether, exceptions are, the palliative treatment of cancer of the uterus; when preparing a prolapsed and ulcerated vagina or cervix for operation the nurse may give one or two mildly antiseptic douches every day for a week or ten days, during which the patient is kept in bed and the vagina lightly packed; after vaginal operations, also, a few antiseptic douches are useful on those rare occasions in which the incisions become septic. In such cases the indication is definite. Under certain circumstances it is desirable to increase pelvic hyperemia, and for this purpose the prolonged warm douche is useful if given under proper supervision and for a limited period. Typical cases for this treatment are pelvic cellulitis following infection of a torn cervix with a more or less massive deposit of inflammatory exudate in the pelvic cellular tissue, where absorption is favored; inflammatory deposits in other pelvic tissues and organs. Thus, in the subacute phases of pelvic infection, vaginal douching is seen at its best. A slow stream of normal saline solution at a temperature of 100 F. to, say, 105 F., kept up for ten or twelve minutes once or twice a day for two or three weeks, forms a part of the proper treatment of these cases, but it must be done with the patient lying on her back.

3. **Recovering Dysentery Bacilli from Stools.**—Martin and Williams say that prior to the war the notion seems to have been widespread that the bacteriologic diagnosis of dysentery was as satisfactory as that of diphtheria, and measures for the control of epidemics have been founded to some extent on this assumption. Their experience of laboratory work in the eastern Mediterranean and in Egypt in 1915 and 1916, however, lead them to the conclusion that the chance of recovering dysentery bacilli from the stools was, after the first few days of the disease, a small one. Similar experience seems to have been had by Kolle and his co-workers, and by Seligmann and Cossmann. Seligmann at a laboratory near the front had opportunity to examine material from the recently evacuated sick. Under these conditions the results were that *B. dysenteriae* Shiga, was recovered in 38 per cent. of cases examined. Seligmann gives the percentage positive findings according to the state of the illness as follows: first week, 70 per cent.; second week, 53 per cent.; third week, 18 per cent.; fourth week and later, nil. The authors give the technic of their method and tabulate their percentage of positive results of 1,050 efforts to recover dysentery bacilli from stools at various stages of the disease, June to December, 1917, as follows: the first to fifth day, 68.0; sixth to tenth day, 17.4; eleventh to fifteenth day, 6.3; sixteenth to twentieth day, 3.1; twenty-first to thirtieth day, 1.5; thirty-first to fortieth day, 3.0; forty-first to fiftieth day, 3.0, and fifty-first to one hundreth day, 0.0. Their conclusions are that the chance of recovering dysentery bacilli rapidly diminished after the first few days. This appeared to be the case whether the stools remained characteristically dysenteric or not. The mucopus and epithelial *débris* discharged in the milder pathologic condition, and the necrosed coagulated superficial layers of the mucous membrane in the more serious, is, except in the earliest stages of the disease, invaded by hosts of intestinal organisms which soon overwhelm the dysentery bacilli originally present. This places a serious limit on the value of a bacteriologic diagnosis of dysentery. If reliance had been placed on the results of one examination, but 15 per cent. would have been discovered.

4. **Fatal Cases of Icterus Gravis Following Novarsenobillon Injections.**—The authors report two fatal cases of icterus gravis following injections of novarsenobillon, in soldiers, aged 26 and 20. These two cases resembled one another closely in their history, clinical manifestations and morbid anatomy. After receiving five doses of novarsenobillon followed by an interval (of seven and fourteen days, respectively), the patients became jaundiced. At first the symptoms were mild, but the jaundice gradually deepened, the liver became greatly reduced in size, persistent vomiting occurred, and the patients died twenty-one and forty days, respectively, after the onset of symptoms. Necropsy showed an acute cirrhosis of the liver. Both were cases of primary syphilis and showed no secondary manifestations. Case 1 gave a negative Wassermann reaction at the conclusion of treatment, but Case 2 gave a double positive reaction on the last occasion on which it was taken.

5. **Toxic Jaundice, with Atrophy of Liver.**—Crawford reports on three cases of toxic jaundice, with atrophy of liver, followed by regeneration and recovery. The patients were workers on T. N. T. manufacturing processes, and were exposed both to fume and skin contact. Two were men aged 29 and 22, and the third a woman of 19. The diagnosis, including the liver atrophy, was confirmed in each case by a government medical inspector of factories. The treatment was necessarily somewhat empirical. The skin was encouraged to act, the bowels kept free by a mild aperient (white mixture) and enemas; nourishment was given in small quantities at frequent intervals—milk and soda water, meat juice, thin broths, barley water, etc.; meat extracts were well tolerated, while fruit and fruit juices disagreed and caused vomiting. Injections of 6 ounces of a saturated solution of sodium bicarbonate were given by the rectum twice daily at the height of the illness, and the same salt by mouth also in a mixture and in milk to the amount of 2 drams daily; whenever this was discontinued the patients became worse. All three patients slowly rallied, and in the fifth or sixth week of the illness began definitely to improve. Convalescence, however, was slow and slight relapses frequent, the patient becoming drowsy and sick, and having recurrence of epigastric pain if allowed to do much at first, or if excited by friends or visitors. The chief points of interest in the cases were: 1. The regeneration of the liver after very extensive destruction. 2. The beneficial result of the exhibition of sodium bicarbonate in what seemed to be hopeless cases. 3. The absence of T. N. T. in the urine when it was being excreted by the bowel.

7. **Amyl Nitrite in Diagnosis of Mitral Stenosis.**—Morison says that in twelve cases of soldiers in whom presystolic murmurs were suspected, but in whom they could not be recognized with any degree of certainty, amyl nitrite (inhaled from a 3 minim capsule until a reaction was evident) brought forth unmistakable murmurs in six instances. Among the first signs of early mitral stenosis is an accentuated first sound; from this sign the sounds pass to a simple reduplication with accentuation; to perhaps a triplication, and thence to what may, or may not, be termed a murmur, according to the idiosyncrasies of the examiner. The point which is to be emphasized is that amyl nitrite, in a large proportion of cases, will raise the scale of the signs, bringing them nearer to a point in which a diagnosis becomes certain.

10. **Dysentery Bacilli.**—Andrewes in differentiation of true from related forms of dysentery bacilli employed sugar reactions, indol formation, alkali formation in relation to initial acidity, the acid agglutination test, and agglutination with specific serums. With reference to the latter he finds: 1. Shiga's bacillus is readily agglutinated and to end titer by any of the stock Shiga serums. No instance of an inagglutinable Shiga has been met with in the course of this work. 2. *B. ambiguus* is not agglutinated by Shiga serums, even in low dilution. 3. Flexner Y bacilli are usually agglutinated to end titer, or its neighborhood, by one or another of the stock serums on the market, but different strains may respond to different serums. 4. Of the allied bacilli, *B. alkalescens* fails to agglutinate with Flexner Y serums within the usual time limit of four to five hours. 5. *B. dispar* is in much the same case. The serologic relations of *B. alkalescens* and *B. dispar* with the Flexner Y bacillus seem thus remote, though there is a suggestion of some small element in common. The species described as *B. ambiguus* and *B. alkalescens* seem fairly well defined and can be rejected as having no connection with dysentery. With regard to the lactose fermenting forms which Andrewes has grouped under the name *B. dispar*—more for the sake of a convenient general term than because he believes them to be a single entity—much more work is necessary. There is a general belief that the lactose fermenters can be excluded in dysentery work, and this is very likely correct; at least, they cannot be returned as dysentery bacilli. Even when all these simulators of *B. dysenteriae* are rejected there will doubtless remain a certain proportion of aberrant strains which cannot be thus accounted for, and some of these may be really atypical members of the Flexner Y group. Judging, however, from this series of 100 strains, the majority of which were sent as presenting abnormal features, such a residue would be very small.

11. **Treatment of Trench Foot.**—The authors try to show that the disease in all its forms starts from the interior, and that the infections which often mark the course of the disease are but the natural secondary manifestations of the reaction of devitalized tissues to infective agents; that, therefore, the treatment of the condition should be directed to the skin only in so far as these secondary infections have resulted in surgical conditions. Standing still in the cold and wet may be the causal factor, in "trench foot," as it must be the exciting factor, in which event, however, all men should be susceptible. Since all men under the same conditions do not fall victims, and since in the men who are affected these facts of clinical blood pressure which the authors herewith demonstrate are to be found, they feel compelled to the conclusion that "trench foot" is a disease incited by the effect of cold and inaction on a foot whose vasomotor system is physiologically impaired, and therefore, though more rarely, they encounter a "trench foot" and "trench knees." The explanation of "trench foot," based on their reasoning and their findings, is that there is a spasmodic contraction of the arterioles of the foot. The first result of this arteriole spasm, is ischemia with numbness, tingling, burning pain; the second result is a disturbance of capillary circulation, perhaps due to back pressure from the veins, perhaps due to the loss of rhythmicity of the driving force, perhaps due to the mere stagnation, with swelling of the foot from edema and diapedesis of red cells. This results in devitalization of the skin and the favoring of infectious processes, and may extend to actual gangrene. The number of cases of "trench foot" on which the authors have made blood-pressure estimations to date is fifty-three. Pressures were also taken on eight other cases not suffering with "trench foot" to serve as controls. With but one exception an inequality of the leg and arm pressure was found in the fifty-three cases of "trench foot," consisting in a very definite increase of the leg over the arm pressure. In the one exception the arm pressure exceeded the leg pressure; after forty-eight hours reverting to the condition found in the other fifty-two cases. In the eight patients used as controls the pressure was found equal in the arm and leg. The leg pressure was also found increased in direct proportion to the severity of the case. As the patient's condition improved the pressure was found to drop, or in some instances, few in number, the arm pressure would rise, and by the time the patient had recovered, the arm and leg pressure had become equal; thirteen cases so far have been observed which show this phenomenon. These thirteen cases, together with seven suffering from other conditions, justify the conclusion that the differences observed in "trench foot" cannot be ascribed to some technical fault in the authors' blood pressure readings. The differences in arm and leg pressure are as follows: the maximum 30 mm., the medium 15 to 20 mm., the minimum 8 to 10 mm.

The authors are convinced that potassium iodid is a most important addition to the treatment of "trench foot" for the prompt alleviation of pain, if for no other reason. In thirty-one cases potassium iodid in 20 gr. doses three times daily was given, with the result that there was a decided relief of pain in twenty-four hours after the first dose had been given. There was also coincidently with the relief of pain in many of the cases a fall of pressure, an average drop of the leg pressure of 10 to 15 mm. In all of the thirty-one cases the potassium iodid was withheld for twenty-four hours on three occasions. The complaint from the patient the following morning was increased pain and insomnia. In some of the cases the dose of potassium iodid was increased to 30 grains three times daily, as 20 grains did not seem sufficient to control the pain. One of the twenty-nine patients treated with potassium iodid alone was also a severe type, with marked discoloration and blebs of both feet. The potassium iodid was sufficient in this case to control the pain. Relief from pain is absolute, but from comparing the cases treated with potassium iodid with others treated by the ordinary methods, the relief is greater in the cases in which the potassium iodid alone has been given, and the duration of the attack is markedly shortened. The only other treatment used in these cases was hot-water bottles to the soles, boric powder dusted on the feet, and flannel bandages.

15. **Epidemic of Toxic Ophthalmoplegia.**—Hall describes a toxic ophthalmoplegia associated with acute asthenia and other nervous manifestations which occurred in epidemic form. The main features of the cases so far observed are as follows: The patient, while in ordinary health, begins to be languid and drowsy, with or without headache, and other symptoms of malaise. In a few hours or days the weakness has increased very much, and indeed, may amount to complete prostration, so that he lies helpless in bed and can hardly move a muscle. Together with this, the drowsiness becomes more marked and develops into real lethargy. Pyrexia may be absent throughout, or it may be present from the first, become severe, and persist. Cerebral excitement and delirium has been a prominent feature in some of the cases. In most of them local symptoms pointing to lesions in the bulbopontine area are present at some time or other. Of these ptosis, ophthalmoplegias of various extent, nystagmus, facial palsy of lower neuron type, unilateral or bilateral, speech affections, and dysphagia have occurred in different combinations in different cases. Muscular tremors of a curious kind have been noted in some; in one case this formed the most prominent symptom, and alcoholism was suspected. In some cases the general muscular asthenia has been more marked on one side of the body than on the other—either arm alone or arm and leg. But there has been, as yet, no evidence of a localized limb paralysis such as one commonly sees in acute poliomyelitis.

Hall has divided the cases provisionally into two broad groups: (1) the meningitic; (2) the asthenic. 1. Meningitic: These cases simulate meningitis very closely, and at a certain stage it is almost impossible to be sure they are not. So far the cerebrospinal fluid has shown no organisms or abnormal cells and its pressure has not been increased, and in a few days the symptoms subside and improvement sets in. Four of the cases were of this type. 2. Asthenic: The asthenic group presents a clinical picture of drowsiness and languor replacing excitement and delirium. The patient without any obvious cause is rendered quite helpless, and lies in bed like a log, unable to turn over or to move the limbs without assistance. There is usually no pyrexia throughout. The effect of the muscular asthenia in the neck and face is very extraordinary. The first case of the series was a boy, aged 15. The facies suggested a myasthenia gravis. In another case, a woman, aged 56, the facial expression was so suggestive of "Parkinson's mask" that Hall thought at first she must have paralysis agitans. As a matter of fact, this was the case referred to above in which general muscular tremors were the chief symptoms. In a few days the symptoms disappeared. In this group there is also a peculiar posture of the hands across the trunk and a kind of plastic tone, not unlike that seen in paralysis agitans. The tremor, however, has no resemblance to the tremor of that disease. Although in most of the cases the symptoms begin to disappear in a few days or a week or two, yet in one case, a man, they still persist after three weeks. The sphincters are not as a rule affected.

Of the ten cases seen up to the present there were: males, four; females, six; ages range from 9 to 70. Only one was under 10. Eight were over 20. It is evident that the etiologic factor is something which acts as a widespread poison on the central nervous system. Such a poison might be of organic or of inorganic origin. It may be connected with some poisonous element in the food or some deficiency of essential ingredients. Attention has been called to the similarity between these cases and certain outbreaks of botulism, due to the consumption of food infected by *B. botulinus*. Investigations on these lines are proceeding. So far, only in one case has the patient in any way attributed the illness to food.

18. **Magnesium and Cancer.**—Dubard gives magnesium carbonate (from 8 to 12 gm. a day) after operations for cancer. He found that marked improvement followed this while ordinary alkaline medication, such as Vichy water, had an unfavorable influence in incipient malignant disease. He believes that there is some connection between neuropathic disorders and the origin and course of cancer, and we all know the important part played by magnesium in the normal functioning of the nervous system. Loss of magnesium seems to favor the onset and development of malignant disease, while administration of magnesium serves to restore these losses and exert a favorable influence on tumors, warts, papillomas, etc. Between 1900 and 1916 he performed 550 operations for cancer, and of 360 patients kept under observation 125, that is, 34 per cent., are known to be living five years at least since the operation. Others have died after survivals of six or seven years. He has thus a global total of 24 per cent. of relatively long survival. His systematic administration of magnesium carbonate kept up for months, he thinks, has had much to do with these favorable experiences. Occasional association with phosphoric acid, sodium fluorid or manganese seemed to aid in the assimilation of the magnesium, he says. The prevalence of cancer in the elderly he is inclined to explain by the substitution in the tissues of calcium for magnesium with advancing age. Some organic combination of magnesium, he adds, might be better than the *magnésie blanche* he has been using.

22. **Alarmists.**—Vallon presents arguments to show the necessity to beware of alarmists during the war. They are either seeking to depress the morale of the people and army, and in that case they come in conflict with the espionage and similar laws, or they are mentally irresponsible. There is nothing astonishing in the fact that pathologic melancholia and other psychoses take this form of alarmist pessimism in this war environment. It is the alienist's task to distinguish between the traitorous and the pathologic alarmists.

23. **Transfusion in Measles.**—Two Arabs were brought to the base hospital with extreme collapse in the course of measles. One speedily died, but the other recovered after transfusion of citrated blood from a measles convalescent. The eruption was diffuse and ecchymotic, the fever up to 41 C., with collapse, anuria, incontinence and toxic dyspnea. After transfusion of 100 c.c. of blood from a man who had been cured of measles for a week, in two hours the vital functions had recuperated and speedy recovery followed.

24. **The Initial Lesion in Tuberculosis.**—Dumas and Perrochon in making roentgen examination of the chests of men with various diseases or wounds or healthy controls made a special point of investigating for some primary initial tuberculous lesion, dating probably from childhood. They found evidences of such in almost two thirds of the adults examined.

25. **The Reaction in the Spinal Fluid in General Paresis.**—Sicard and Roger reiterate that the Bordet-Wassermann reaction is always positive in the cerebrospinal fluid with progressive paralysis, and is irreducible even under intensive treatment. Their findings have been invariably positive in more than 100 cases of general paresis in the last six years. They insist that negative findings disprove the diagnosis of general paresis. In the blood, the reaction was positive only in 95 per cent. of their cases, and it veered to negative in all but 35 per cent. under intravenous arsphenamin treatment.

26. **Slow Endocarditis.**—Fayolle reports the clinical history of a case in a man of 33, and Debré the necropsy findings in a case previously published. Debré has found constantly in his cases a streptococcus nonvirulent for laboratory animals, and its cultures do not form a halo on solid mediums with blood. It turns hemoglobin green, and hence Schottmüller calls it the *Streptococcus viridans*. The endocarditis is of the vegetative type; enlargement of the spleen and multiple joint lesions are constant, as also multiple infarcts in the abdominal organs. Subacute nephritis is always found at necropsy. The rupture of some intracranial aneurysm is usually responsible for death.

29. **Paroxysmal Visceral Disturbances with Inherited Syphilis.**—Barbier emphasizes the frequency with inherited syphilis of localized syndromes, such as paroxysmal vomiting, paroxysmal enteralgia and paroxysmal incontinence of urine. The paroxysmal vomiting seems to be most frequent between the ages of 5 and 10. It occurs usually in the morning, fasting, generally preceded by frontal headache a few hours or even days before the paroxysm of vomiting comes on. The headache keeps up during the vomiting, but stops when the vomiting is over. The child's sleep is not so sound as usual, and there may be signs of insufficiency of the liver. There is no nausea; the vomiting occurs suddenly, in a gush. After expulsion of the food in the stomach, the vomit seems to be pure gastric juice. The child may thus vomit twenty times in the twenty-four hours, and there may be some blood in the vomit at last. As soon as the child stops vomiting it returns to its play. The attacks may last from a few hours to two or three days. There is no periodicity about their recurrence;

there may be two or three in a few months and then no more for several years, or there may be two or three a year. They are rarely closer together than this. Occasionally the attacks are accompanied by meningeal symytoms, somnolence, arrhythmia, and tendon and pupil changes. Unless a positive Wassermann reaction can be obtained, it is often difficult to differentiate this inherited syphilis vomiting from that with an incipient cerebellar tumor or tuberculous meningitis. With the latter there is usually fever at times, while there is none with this syphilitic vomiting. Appendicitis may be suggested by this latter, but lumbar puncture should be done before appendicectomy in dubious cases. Attacks of enteralgia with diarrhea may alternate with the vomiting, and incontinence of urine may be referred to the same cause. This incontinence may accompany the gastric crisis, or there may be attacks of transient incontinence occurring alone. A positive Wassermann reaction in such cases explains the incontinence. He treats such children with weak doses by the mouth, rejecting the inunction method which he regards as dangerous for children. He knows of cases of sudden death after mercurial inunctions.

31. **Syringe for Both Aspiration and Transfusion.**—Larché's *transfuso-aspirateur* is fitted with a combination trocar-needle. A serous or purulent pleural effusion can be punctured and evacuated and an aseptic gas or disinfecting solution can be injected into the cavity, all through the one syringe and at the one operation.

32. **Chronic Arsenical Intoxication After Arsphenamin Treatment.**—Sicard and Roger discuss the three types of disturbances that may follow intravenous treatment with any of the new preparations of arsenic: disturbances in the nature of anaphylaxis, disturbances from the mixed reaction of the arsenic on the spirochetes—their virulence enhanced in response to the action on them—and disturbances from pure arsenical intoxication. They report here five cases of general paresis in which intravenous injection of a French preparation of arsphenamin had been rapidly pushed to a dose of about 1.8 gm. per week, or 15 or 30 cg. had been given daily. This intensive treatment was given at the demand of the patients and their families, but after from 11 to 12 gm. had been administered, erythema, falling of the hair, abscesses and ulcerations in one of the men testified to the chronic arsenical poisoning, and he died in consequence of ulcerations in pharynx and tongue, with hemorrhages. The others all seem to have benefited materially by the treatment, but the Wassermann reaction is still positive. These men took 15 or 17 gm. in the course of two or three months. Sicard found the skin reaction to iodin a reliable means of detecting the approach of arsenical intoxication. When the skin has reached the limit of its endurance, painting with tincture of iodin brings out a crop of blisters. He applies this test to the forearm, and the dermatitis with the vesicles is apparent the next day. This sign became manifest after intravenous injection of from 10 to 12 gm. of novarsenobenzol in the course of about two months, and the reaction was positive a long time after suspension of the drug. With the big weekly doses, the kidneys and the liver suffered most, and by the eighth or ninth gram, albuminuria and subjaundice were evident. With the small daily doses, the kidneys and liver did not seem to suffer appreciably and there were no symptoms from them, but the ectoderm seemed to be unable to stand more than 12 gm. in the two months.

33. **Dyspepsia in Men Returning from Prison Camps.**—Ramond and Petit have examined forty men repatriated after long imprisonment in Germany, and practically all were suffering from acute or subacute gastro-enteritis, the condition much like those in herbivora kept on a meat diet. The corroboratory evidence of all shows that the diet at the Würzburg, Darmstadt and Gräfenburg camps consisted of bread containing bran, straw, potato, corn and sawdust, barley coffee, no sugar, bean or turnip soup, and at supper 40 gm. of cheese of the Brie type or a piece of sausage the size of one's thumb, or herring. They comment that "the Germans have no excuse for these scanty rations, for the potato harvest in 1917 was particularly good, and the stock of pigs was never so large. The Austrians, on the other hand, although with greater scarcity of foodstuffs, yet have made a point of respecting the international conventions which they had signed." Among the repatriated from Germany whom they examined, fully 10 per cent. had confirmed gastric ulcer; four required an operation for stenosis of the pylorus.

"These gastric disturbances," they add, "are not the only ones nor the most frequent. There is the long, sad train of those with advanced consumption. What the shells and the poison gases fail to accomplish, the prison camps complete. We witness thus the slow and implacable death agony of all our young men, without a single word of protest being raised. And while our sons are perishing obscurely in the jails and camps of Germany, France, always foolishly generous, does not reciprocate. Our German prisoners have abundant food, which they can vary; they enjoy excellent health. When the war is over they will take up again the economic struggle, with all their forces intact, and it will not be our soldiers returning anemic from Germany, in greatly diminished numbers, who will be able to crown the victory of our arms with the economic victory."

44 The Soldiers' Ration. M. Labbé.—p. 275.

37. **Psychoses in Malaria.**—Porot and Gutmann describe three varieties of acute malarial psychoses and four of the prolonged type, with several subvarieties. They are in charge of a *centre neurologique*, and their experience emphasizes the imperative necessity for vigorous and persevering treatment (quinin) in all cases of the mental confusional state, the initial psychopathy, in malaria. Under proper treatment this often subsides, and thus is warded off the prolonged and rebellious form of malarial psychopathies. In one of the typical cases reported, the young man developed the syndrome of dementia praecox within a year of contracting malaria in Macedonia. No other pathologic antecedents were known in the personal or family history except that he had had convulsions as a child. In another case the man of 37 developed acute mania but under seven months of sanatorium treatment regained his mental poise, although still somewhat excitable.

39. **Bacteriologic Control at Advanced Surgical Station.**—Rosenthal comments on the importance of the bacteriologist's statement that a wounded man recently brought in, and apparently not gravely wounded, yet harbors the perfringens for instance. The surgeon is thus warned of the necessity for extra thoroughness in his operation. The Carrel-Dakin method seems to be especially effectual in clearing out the large anaerobes. Every war operation may be modified by the bacteriologic findings, either spurring to extra care or justifying less vigorous measures. The bacteriologic control during the intervention must be restricted, of course, to rapid examination with the ultramicroscope when possible, without staining or some simple stain, the gram—these will readily show the group to which the microbes in the specimen belong. The perfringens, in particular, is the one that seems most to be dreaded. The bacteriologist thus in five minutes can tell the surgeon that the wound is aseptic or contains diplococci, or there is complex diplobacillary infection with both aerobes and anaerobes.

40. **War Bread.**—This is a study from the biologic standpoint of the various materials now used in making bread. Among the practical conclusions is the suggestion that possibly an aqueous extract of bran, rice hulls or other hulls of grains might contain the vitamins necessary for health, and if bread was made with this "bran water" it would not

be necessary to burden the digestive tract with so much cellulose. Weill and Mouriquand report considerable experimental research on pigeons, confirming the importance of these vitamins. They say, "Notwithstanding the Americans, we are at present obliged to live almost exclusively on our supply of wheat, and the 1917 crop was below the average." Their experiences confirm further that bread made with lime water, instead of ordinary water, seems to keep better and be more palatable, free from the bitter taste which the "war bread" sometimes leaves in the mouth. The Italian "Bergamo bread" is made of whole grain without grinding. It is subjected to maceration for two days, in water at 20 C., and it is then mashed and used directly for making dough. There seems to be some germination of the grain, and this seemed to increase the nutritional value of the grains for guinea-pigs in their tests. The germination possibly aids in transforming the albumins into peptones, or amino-acids, and the starch into dextrin and glucose.

45. **Cranioplasty.**—Le Fur has applied in thirty-seven cases the technic he describes with illustrations, and has found it constantly reliable while its simplicity and ease commend it above other methods. He splits horizontally the bone of the skull over the desired area, and then turns the upper slice back, as if on a hinge, thus covering the opening in the skull. The periosteum is loosened back from the farther edge of the bone flap thus turned over, and it is used to suture the flap to the periosteum of the skull beyond. The skull then shows the rectangular flap with its inside turned up, and the rectangular space in the skull beyond, from which the flap was split off. The tables of the skull are easily separated, and the flap is taken large enough to extend beyond the hole to be covered. The method is applicable even for very large gaps in the skull, as two flaps can be cut and turned back to overlap, thus covering a large area.

47. **Recurring Acute Articular Rheumatism in the Course of Long Established Heart Disease.**—Josué and his coworkers refer to *poussées rhumatismales* in the form of joint swelling and pain, or pain in the muscles occurring in the course of chronic heart disease. They are liable to be mistaken for tonsillitis or influenza or acute bronchitis. The heart symptoms are overshadowed by those from the exacerbation of the rheumatismal infection. Or it may act on the heart alone, sparing the joints, including a febrile asystole with or without general disturbance; congestion of the liver; edema of the legs; dark colored, scanty urine and arrhythmia. Under the salicylates the symptoms promptly retrogress, while they persist stubbornly under other measures. They warn that the doses must be large enough to be effectual, from 6 to 8 gm. daily for several days, continuing with 4 gm. for some time. They give about the same amount of sodium bicarbonate with it to insure tolerance by the stomach. They give children 0.5 gm. per year of age up to 6, and then 3 gm. daily. Unless the salicylic medication is vigorous and long kept up, the infection is not conquered but persists in an almost latent form continuing its ravages to irreparable lesions.

50. **Malaria in France.**—It was early recognized that the men returning from Macedonia with malaria might import the disease and form foci of infection for others, creating new foci or rousing long slumbering foci. A commission was appointed to study the subject, and the country was charted to show the regions where the anopheles abounds and where it cannot be found. The men returned to France with malaria are now distributed in the nonanopheles districts, but before the danger was recognized, several active foci had developed. In some the infection was traced to soldiers from French China, carriers of the malaria parasites.

52. **The Mencière Treatment for War Wounds.**—Mencière's aim is to fill the wound with a fluid which will hold the microbes in check while soothing and relieving pain. The man can then be safely left without further treatment for several hours or even days, confident that the wound will be found practically *in statu quo* when conditions permit thorough surgical treatment. Mencière here quotes the testimony of numerous army surgeons on the efficacy of this embalming treatment in its special field, that is, when a big drive is on, or other conditions prevent careful surgery at once. He says that the formula that has stood the test of thousands of experiences is 10 gm. each of guaiacol, eucalyptol and balsam of Peru; 10 gm. of iodoform; 100 gm. alcohol and ether to 1 liter. For one or two applications only, for severe gangrenous wounds, he substitutes 10 gm. of benzoic acid in the formula, or merely adds 9 gm. of benzoic acid to the first formula. He explains the action of the different ingredients, especially the penetrating action of the ether which follows the microbes into the depths of the tissues lining the cavity, where the microbes are most active; those free in the cavity are already dead. The fluid is sprayed copiously into the wound, and this can be done by any one. It does not interfere with the surgeon's work later. The fluid can be used further as a systematic dressing after the surgical toilet of the wound. The protection conferred by this dressing seems to be only for twenty-four hours at most. The official instructions from the army medical department, dated October, 1917, state that, in case of precipitate evacuation of the wounded, after excision of devitalized tissue it is advisable to apply some dressing the action of which would continue during the entire duration of the transportation. No particular dressing was specified, but Mencière insists that his formula answers the purpose, and that 1,200 or 1,300 army surgeons are using it.

60 Tuberculomas. Gougerot and Dénéchau.—p. 644.
61 Skin Reaction to Vaccine. H. Pied.—p. 658.

56. **Concussion of Cervical Spinal Cord.**—Claude and Lhermitte describe cases from their experience in which the concussion of the spinal cord in the neck from a projectile entailed grave quadriplegia, hemiplegia or monoplegia and a cerebellospasmodic set of symptoms without actual paralysis. They have encountered also a number of abortive cases of these various types. Notwithstanding the apparent gravity of the paralysis, the evolution has been constantly favorable. Motor function and sensibility have gradually returned. This is in marked contrast to the course of similar lesions in the dorsal, lumbar and sacral spinal cord.

58. **Nervous Disturbances from Wounds of Arteries.**—Desplats and Buquet declare that not enough attention has been paid to injury of the medium seized arteries in the nervous disturbances of the wounded. Obliteration of a trunk artery is enough in itself to entail motor, sensory,

and trophic disturbances and modify the electric reactions. The terminal distribution is characteristic, and these disturbances are the more pronounced the higher the segment of the artery involved, and at points where collateral circulation is less readily established, especially in the arm. The zone of the axillary artery is the most dangerous. Traumatic obliteration of this artery may alone entail ulnar, median or radial paralysis, with the reaction of degeneration in the segment of the arm involved and complete anesthesia of the tips of the fingers. The fingers may also show characteristic deformity. This set of symptoms becomes attenuated as the obliteration or compression of the artery is farther from the trunk. In the leg the symptoms are masked by the tendency to gangrene. In the majority of cases, however, both the artery and the nerve are injured by the projectile. To operate on the nerve and neglect the artery is as futile as to operate on the artery and neglect the nerve.

59. **Epilepsy.**—Plantier epitomizes his opinion of epilepsy in the statement that it is a "toxicate of spasmophilia." Spasmophilia is usually an inherited taint, but it may be acquired in the course of lead or alcohol, coffee or tea poisoning, or the spasmophilia may develop from some local cause, possibly relics of meningitis or encephalitis, consecutive to some acute infection in early childhood. We all know instances where extraction of a wisdom tooth, of a polyp in the nose, or of hardened wax in the ear has arrested a tendency to epilepsy even of long standing. He remarks that it is useful to read over the cases of this kind, that are so numerous in the literature, in order to impress on one's mind the imperious obligation in the presence of an epileptic to eliminate every possible acquired local cause for spasmophilia before ascribing it to heredity, or diagnosing it as common, essential epilepsy. The continuous abnormal excitation transmitted to the motor neuron from the foreign body, sequester, calculus, helminths or carious tooth, keeps up a kind of tetanization of the hyperactive motor nerve cell, and the partial or complete epileptic seizure is the result. This is hastened and intensified by any superposed toxic action. Digestive auto-intoxication is the main and usually the only source for the toxic action. He has found the liver pathologic in almost every epileptic he has had occasion to examine. This coincidence explains the absolutely unexpected arrest of the seizures in many epileptics who were given treatment addressed to the liver.

March 31, 1918, **39**, No. 26

70 *Treatment of Frozen Feet. G. Cocci.—p. 254.

69. **Reaction of Blood to Tuberculin.**—Barlocco describes the morphologic reaction of the blood to the cutaneous and subcutaneous introduction of tuberculin in healthy and tuberculous subjects. In the healthy there did not seem to be any appreciable change in the blood after subcutaneous injection of 0.001 gm. of tuberculin, but with a larger dose there was pronounced hyperleukocytosis with neutrophilia. In the tuberculous, injection of 0.001 gm. tuberculin, or even half this, induced a neutrophil hyperleukocytosis with sometimes slight eosinophilia. This reaction is independent of the eventual thermic reaction to the tuberculin. He gives charts and tables from typical cases to illustrate these findings, as also the findings after the skin tuberculin test. They seem to be the same in all these conditions, differing merely in degree and proportionate to the amount of tuberculin used. The lymphocyte curve does not seem to be modified.

70. **Treatment of Frozen Feet.**—Cocci refers to extremely grave freezing of the feet with gangrene and mutilation. In his service the mortality of these cases with freezing of the third degree was from 70 to 80 per cent. until he began to sear them with a red hot iron, passing it flat and slowly over the gangrenous surface to the line of demarcation. The tissues thus destroyed are only those already devitalized by the gangrene. The heat induces such an afflux of lymph and blood that the tissues beneath start to heal naturally, and as the scorched tissues are cast off, healthy granulations are found beneath. The fever subsides and with it the edema, the gangrene becoming dry gangrene. This favorable outcome is not constant, but it occurs often enough to render this method of treatment far superior to anything else he has tried, and saved months of suffering and extensive mutilations in many cases. The streptococcus was found in a pure culture in the blood in most of these severe cases.

75 *Clinical Signs of Anatomic Healing of Pulmonary Tuberculosis. P. Rusca.—p. 369.
76 Primary Edema in Malaria. F. Paoletti.—p. 373.

71. **Dermatitis in Sorghum Harvesters.**—Hoffer found a peculiar dermatitis in twenty-five members of seven different families engaged in cutting sorghum. It gradually subsided in the course of three or four weeks. A parasite resembling a parasite found in flour was found in the sorghum and was probably responsible for the dermatitis.

75. **Signs of Healing Tuberculous Process.**—Rusca analyzes the signs he has found in soldiers showing a clinical cure of pulmonary tuberculosis under prolonged sanatorium treatment: After all the previous symptoms have subsided and the general health has improved, there may be pains in the region that was the site of the process. As the fibrous cicatricial tissue forms it may pull on the adjoining tissues, and the nearer to the pleura, the more pronounced the pain. The toxi-infectious process may have rendered the nerves in the region more sensitive. These painful sensations are a sign of healing; they are not accompanied by return of the old symptoms, and there is no tender spot to be found in the region. The painful sensation is continuous, and has no connection with the respiration or the position, and it subsides in a few days. This pain with a healing tuberculous process is probably often mistaken for casual neuralgia, or congestion. Rusca also calls attention to the occurrence of minute hemoptysis as another sign of the healing of the focus. It occurred after effort, as for example at defecation, and the hemoptysis seemed to be connected with the painful sensation mentioned above, as the latter usually preceded, accompanied and followed it. The sputum was slightly tinged with blood, not enough to redden it, but merely to give it a salmon-color tint. The microscope shows well preserved elements of the blood but no pus or tubercle bacilli. Several writers have emphasized the tendency to capillary hemorrhage in the sclerosis of a tuberculous focus in the lung. Extensive hemoptysis occurs with destructive processes, but the capillary hemorrhages seem to occur only in the circumscribed, well encapsulated processes, or with the penetration of newly formed vessels into the forming cicatricial fibrous tissue. This salmon-tint hemoptysis was never preceded or followed by the slightest exacerbation of the auscultation findings. The bleeding probably proceeds from some newly formed and not quite complete new blood

vessel, which had ruptured under the preceding physical exertion. This slight hemoptysis is thus an additional proof of the anatomic repair going on. His conclusions that the above mentioned local pains and the minute hemoptysis are signs of favorable import are based on wide experience of numbers of cases traced for months or years afterward.

77. **Hematemesis after Poisoning from War Gases.**—Zagari reports the case of a previously healthy robust soldier who was knocked down unconscious by an exploding bomb which contained a toxic gas. He was not picked up and did not regain consciousness for about twenty-four hours. While others suffered from the effects of the gas in the air passages, he had no symptoms from them and no laceration, merely a pain in the lumbar region and a little blood in the urine, and in a few days symptoms indicating ulceration in the stomach. The ninth day he vomited blood, and the hematemesis recurred five times in the following three months. Under treatment of the gastric ulcer and the hemorrhagic tendency, the man recuperated and he has had no further symptoms on the part of the stomach for two months to date. [A communication was read recently before the Paris Société des Hôpitaux which was struck out of the published records by the censor, but brief reference to it by another speaker showed that it was a similar report on gastric ulceration from the toxic action of war gases.]

78. **Treatment to Hasten Healing of Epithelium.**—Taddei reports that his experience in thousands of cases has confirmed the way in which iodin promotes the healing over of a wound when applied after the cavity of the wound has filled up with granulations. He lays a strip of ordinary adhesive plaster on a compress and swabs the adhesive side with a 10 per cent. tincture of iodin. When dry, it is cut in strips 4 or 5 mm. wide and from 3 to 8 cm. long and these strips are applied to the edge of the wound, the strip fitting for 1 mm. on the epithelial margin of the wound and the other 3 or 4 mm. on the granulation tissue. Three, four or six of these strips are applied to outline the wound like a narrow frame. The iodin applied in this way seems to stimulate the production of epithelium while protecting it when the dressings are changed. He states that in many cases the epithelium healed over as promptly and effectually as if Thiersch grafts had been applied. The plaster alone without the iodin, does not answer the purpose so well.

81. **Stool Signs of Liver Disease.**—Campana remarks that when there is an irritative process in the liver, the stools show cellular detritus, nuclei of liver cells, leukocytes, the bile pigments of these cells and glycogen. These pass out of the liver with the bile into the intestines, and can be detected in the stools. The patient must be kept for a few days before on starchy and albuminoid food, and the teeth must be clean and the anus washed with soap and thoroughly dried. He refers in particular to the findings in the stools as revealing syphilitic hepatitis.

82. **Granular Red Corpuscles.**—Ravenna declares that the best method known to date for showing up the granular reds is with a 0.8 per thousand solution of brilliant cresyl blue in a 7 or 8 per thousand solution of sodium chlorid, kept at 37 C. for fifteen minutes, or at 16 or 18 C. for thirty minutes.

84. **Diagnosis of Cancer of the Liver.**—Ferrannini emphasizes that metastasis is less frequent and less early with cancer of the liver than with malignant disease elsewhere, as a rule. He cites twenty authors in the last twenty years who have come to this conclusion. In three cases in adults in his own experience there was no trace of involvement of the supraclavicular glands but merely some enlargement of the retroperitoneal glands, and some in the omentum. There was no pronounced emaciation, and in one patient the complexion was ruddy, except where there was a tendency to cyanosis from the interference with the circulation by the ascites. The patients were at the cancer age, near 50; the liver felt knobby, and it had increased rapidly in size; there was no jaundice or eosinophilia, but there were symptoms on the part of the stomach resembling those with gastric cancer. Echinococcus disease seemed probable at first, but this diagnosis was dropped on discovery of the enlarged glands back of the peritoneum and in the omentum, which also excluded syphilitic gummatous disease of the liver. He emphasizes these differentiating points as they contrast with those of Griffith's recent compilation of fifty-seven cases of cancer of the liver in children. Cachexia and metastasis were common, but ascites and jaundice were rare among the children.

April 13, 1918, **19**, No. 15

87 Dysenteriform Diseases at a Base Hospital. A. Roccavilla.—p. 169. Conclusion.

85. **Quantitative Determination of Glucose in the Urine.**—Ugdulena comments on the importance from the military standpoint of the determination of permanent glycosuria and the elimination of the factitious—all of which requires repeated examinations, and a simplified technic. For this he uses two sets of ten test tubes. The first ten tubes have straight sides and serve for the dilution of the urine. The first tube is filled with urine. In the other nine he places 2 c.c. of urine in each, and adds 1, 2 or 3, up to 9 c.c. of distilled water, the number of cubic centimeters of fluid in each corresponding to the number of the tube in the series. The ten tubes of the second set taper to a point. The Fehling reagent solution is placed in each up to the 5 c.c. mark and then urine is added to the mark showing 2.37 c.c. in addition. The urine for this purpose is taken for each tube in the second set from the correspondingly numbered tube of the first set. After they have been thoroughly agitated, a few drops of liquid petrolatum are poured on top to form an airtight covering, several millimeters thick. The tubes of the second set are then placed in their standard in the water bath and kept for ten minutes at a temperature of 95 or 100 C. The number of the test tube which contains the minimal dilution compatible with complete reduction of the Fehling solution, represents the percentage of glucose in the urine. No calculations are necessary, as we know that 50 c.c. of Fehling's solution is reduced by 23.75 c.c. of urine containing 1 per cent. glucose. With the ten tubes containing each 5 c.c. of the reagent and one-tenth of the 23.75 c.c. of urine, that is, 2.37 c.c. in each tube, the tube in which there is complete reduction evidently corresponds to 1 per cent. of glucose. If this diluted urine came from tube No. 4 of the first set, that is, the tube in which the urine had been diluted with three parts water, then we know that the figure 4 represents the percentage of glucose in the urine. A colored plate shows the two sets of tubes, the markings, etc., so that the whole technic can be seen at a glance. The urine keeps well under the liquid petrolatum so that the tubes can be examined and reexamined at leisure.

88 *Acute Case of Brazilian Trypanosomiasis. E. Villela.—p. 65.
89 Eugregarina Parasite of Brazilian Arthropods. III. C. F. Pinto.—p. 65.
90 *Leishmaniosis of the Nose. C. de Rezende.—p. 66.

88. **Chagas' Disease in Brazil.**—Villela reports the first acute case of this trypanosomiasis in the state of S. Paulo

in Brazil; it is the third case known in which skin lesions formed part of the clinical picture. The beetle known to be the host of the *Trypanosoma cruzi* was found in a certain locality in the state, and he then examined the inhabitants and found this acute case of Chagas' disease, with multiple skin lesions, in a child of 16 months. All the three generations in the family showed goiters, and this child had the aspect of myxedema, slight fever and enlarged glands, spleen and liver.

90. **Destructive Leishmaniosis.**—The illustration shows the destruction of the nose and nasal fossas by the leishman process. The patient was a boy of 16 and the trouble had commenced eight months before like a pimple on the nostril. Under local treatment with tartar emetic it healed promptly and completely, and the boy now breathes normally through his nose notwithstanding the loss of the septum. The results were equally favorable in three other cases, all healing under local treatment alone. De Rezende combines the drug with substances that penetrate deep into the tissues and others which form a varnish so that the application sticks and hardens, not requiring any dressing. His formula is 0.2 gm. each of arsenic trioxid, copper sulphate, methylene blue and of methyl violet; 0.5 gm. quinin; 0.75 gm. tartar emetic; and 1 gm. each of camphor, menthol, phenol and antipyrin, the whole forming a salve which is applied with a cotton-wound toothpick two or three times a week. In less than a month the lesion had completely healed in the severe case illustrated.

97 Placenta Praevia. J. Botella y Montoya.—p. 318.
98 *Physiotherapy for Gastric Ulcer. S. Carro.—p. 320.

92. **Photographic Record of the Pulse.**—Casares gets a photographic record of the oscillations of the fluid in a small U manometer containing water, alcohol, acetone or ether. He calls the apparatus for the purpose a palograph and the tracings palograms, from the Greek word *palos,* to "palpitate." This palography reproduces, he says, the movements of the heart, of arteries and veins, with a detail hitherto unattainable. No further details are given.

95. **Beriberi in Spain.**—Martinez has discovered in Spain cases of amebic dysentery, kala-azar in children and cutaneous leishmaniosis, and now he reports a case of *beriberi*—none were imported cases. The beriberi case was in a fisherman of Granada who was admitted to the hospital with the diagnosis of polyneuritis, but the symptoms on the part of the heart, the cachexia and the absence of malaria, alcohol and syphilis in the antecedents led to the assumption of beriberi, a year after the first symptoms had appeared. Under repose, nourishing diet, avoiding fish, rice, potatoes and the other dishes to which he was accustomed, and a tonic, with massage, the symptoms gradually subsided to a complete recovery in time.

98. **Diathermy in Treatment of Gastric Ulcer.**—Carro extols the efficacy of diathermy in treatment of ulcerative or inflammatory processes anywhere in the digestive tract and especially for gastric ulcer. In three cases of gastric ulcer described, the lesion had not been modified by the usual courses of treatment, but the improvement under the thermo-penetration was pronounced. In all the gastric ulcer was of several years' standing. Hyperchlorhydria is the rule with gastric ulcer, and this keeps the ulcer from healing. Anything tending to promote secretion of gastric juice is contraindicated with gastric ulcer. The diathermy also benefited materially a man of 54 with dysenteriform ulcerative colitis of ten years' standing. The improvement was most gratifying, the stools losing their diarrheic character and the pains becoming much attenuated. Carro gave from eight to twenty sittings in the gastric ulcer cases. He begins with 1 or 1.5 amperes and never goes over 2.5. The sittings are given daily, twenty or thirty minutes long.

104 Antirabies Service. G. Vianna.—p. 64.
105 The Lines in the Parietal Bone. F. da Fonseca.—p. 69.

100. **Reinfection with Syphilis.**—Wallau's patient is a man of 30 who beginning in 1906 has had four primary lesions in turn, at intervals of seven years and about one year. In the course of these experiences he has been given a total of 7.5 gm. of arsphenamin (salvarsan), and 944 gm. mercury by inunction, besides twenty intramuscular injections of mercury. He has been in good health free from symptoms during the last two years.

101. **Foreign Bodies.**—Wallau emphasizes the necessity for not trusting to the patient's statements as to sensations, etc., with a foreign body. In one case a man insisted that the set of false teeth he had swallowed could be felt in the stomach, but the organ was empty when opened. Under chloroform the man vomited profusely, and thus expelled the set which had been impacted in the esophagus. In times of epidemics an unsuspected foreign body may be mistaken for the prevailing disease, as in the case of a child with supposed diphtheria symptoms until a scrap of wood was found sticking in the throat. In his three cases of myiasis of the nose, one of the patients succumbed to meningitis; in the other two the larvæ were washed out in time with weak solutions of mercuric chlorid and creolin. In two other cases a glass tumbler was removed from the rectum. One tumbler was 7.5 cm. tall by 7.5 in diameter at the top; the other tumbler was 9 cm. tall by 6 in diameter. Both were removed whole. In a recent case of supposed cancer of the vagina, a fragment from a pessary used for a short time years before proved the cause of all the disturbances.

107 *Experiences with Spinal Anesthesia. J. Blanc y Fortacin.—p. 257.
108 *Unusual Conditions in Hernias. J. Blanc y Fortacin.—p. 264.

107. **Spinal Anesthesia.**—Blanc has found the anesthesia available in from three to ten minutes after injection of the anesthetic into the spinal canal; the sensation of contact is retained. The anesthesia was a success for operations on the legs but, for herniotomies, sometimes a few whiffs of cloroform were necessary in addition. In his 200 cases of intraspinal anesthesia there were serious mishaps only in two cases. In one of these by mistake the assistant had made the solution with 0.12 gm. of novocain, and syncope followed, requiring artificial respiration under which the patient promptly recovered. In the other case the patient was an elderly man with impassible stenosis of the urethra, and the operation was for retrograde catheterization. The operation was brief but there was some cyanosis afterward and coma followed in an hour with death in another hour.

The anesthesia lasts about two hours and there is sometimes headache, but it is very slight and brief. There is often a febrile reaction, evidently from aseptic irritation of the meninges as the spinal fluid looks turbid the next day and there is polynucleosis, but all returns to normal by the third or fourth day. Vomiting and paresis were never observed. He operated above the umbilicus only in one case, on an echinococcus cyst in the liver, and the operation was a smooth success. The anesthetic used was generally 6 cg. each of stovain, glucose and 1 per thousand epinephrin in 1 c.c. of physiologic serum. Of late he has been using cocain and epinephrin.

108. **Unusual Features of Hernias.**—When the cecum is sessile on and adherent to a hernial sac containing the appendix, Blanc warns that there are likely to be vessels at this point on which the cecum depends for more or less of its nourishment, and hence a plastic operation is usually necessary, through a second incision in the abdomen above. In two of his cases the hernial sac was formed of a diverticulum in the bladder. The nature of the hernia was not suspected until the hernial sac was incised and the pink color of its lining attracted attention. In both cases the diverticulum was surrounded and concealed by masses of fat. He excised the diverticulum in one case and inverted it in the other. In many cases, traction on the hernial sac pulled the bladder down into view. In one case a direct hernia had caused no trouble as it was kept under control by a truss. Then suddenly it increased in size and distended the scrotum but was not painful. With the diagnosis of hydrocele superposed on the congenital hernia, he incised the supposed hydrocele and found it an *echinococcus* cyst.

112 *Tuberculosis in Uncivilized Tribes. J. Schut.—p. 3.

110. **Biologic Processes in Tropical Soils.**—These bulky volumes are issued by the Civilian Medical Service of the Dutch West Indies. They are published in the Netherlands language and in English, in parallel columns. This number of 150 pages is devoted to questions relating to the disposal of night soil and sewage in tropical conditions. The biologic processes occur with greater intensity in tropical soil, so that large quantities of organic matter are rapidly decomposed in a small space, with destruction even of intestinal bacteria. Hence, it is said, the closed septic tank offers peculiar advantages on this account in tropical countries, with oxidizing beds for the effluent.

112. **Tuberculosis in Virgin Soil.**—Schut reviews what is known to date in regard to pulmonary tuberculosis among savage tribes and natives of remote districts where the disease finds virgin soil. In the East Indies tuberculosis is rare, while other diseases giving a positive response to the skin tuberculin tests are common, and in the natives the response is nearly always negative with frank tuberculosis. Consequently, the Pirquet test is not reliable in the diagnosis of tuberculosis among the natives. He ascribes the higher mortality from tuberculosis—when such exists—among the native East Indians to the low resisting power from the climate, conditions of life and endemic diseases. There is no need to invoke a "virgin soil theory" to explain why tuberculosis runs a particularly acute and dangerous course in them.

115 *Acute Bulbar Paralysis. L. Nicolaysen.—p. 428.
116 Electrocardiography in Diagnosis. N. B. Koppang.—p. 433.

113. **Constitutional Hypersensitiveness and Asthma.**—De Besche reports the case of a physician of 30 who developed an alarming condition for an hour or so after a preventive injection of diphtheria antitoxin. This was a year or so before attention had been called to the danger of symptoms suggesting anaphylactic shock with injection of antitoxin when there is constitutional hypersensitiveness to horse serum and horse emanations. The physician knew that, from childhood, when he had anything to do with horses symptoms resembling those of hay-fever developed, with asthma. De Besche has made a special study of this idiosyncrasy to horses, and reports the details of eleven cases and one in which the idiosyncrasy was to cats. In eighteen other cases of asthma, no connection with horses or other animals could be detected. An idiosyncrasy of this kind can be rendered evident by touching the skin of a horse with the finger and then placing the finger on the conjunctiva of the patient's eyeball. In all cases of horse asthma, pronounced redness, lacrimation and slight edema follow, and sometimes sneezing. There is no appreciable reaction in the absence of this idiosyncrasy. The reaction is also instructive but is less constant when a drop of the horse serum is applied to a scarified area, as for vaccination against smallpox. A blister forms. He remarks that it might be advisable to apply these eyeball and scarification tests before injecting antitoxin in persons subject to asthma or hay-fever, and thus be able to exclude an idiosyncrasy. In his total twelve cases of horse asthma, in some the idiosyncrasy was to horses alone; in others also to cows, dogs and goats. Two had also hay-fever, and a tendency to hay-fever or asthma was common in other members of the family in several cases. In some of the horse-asthma cases the manifestations of the idiosyncrasy were accompanied by abdominal pain and vomiting or diarrhea. The physician first mentioned had a severe attack of the horse asthma once after dinner on a day when there had not been any known connection with horses. But the precipitin test, applied to the sausages from which he had eaten, revealed horse meat in them. One of the horse-asthma patients developed typical attacks also after eating strawberries. De Besche mentions that the attacks in his cases were exactly like those described by Willey, Bacon and Wright in The Journal, 1908-1909.

114. **Rhinogenous Retrobulbar Optic Neuritis.**—Malling reviews thirty-seven publications bearing on this subject and describes a case from his own experience in which a previously healthy woman of 40 developed a highly febrile diseased condition in the nose and left ear, confining her to bed for some time. A polyp had been removed from the nose just before. Two or three months later vision became impaired, and by the sixth month there were signs of beginning atrophy of the optic nerve. Nothing was found to suggest any other cause than the nose-ear trouble. Under potassium iodid, vision improved somewhat, but it was still only 6/18 in the right and 6/60 in the left eye. The ethmoidal cells then were found extremely pathologic and they were cleared out. Improvement was prompt and pronounced, vision in a few days increasing from 6/12 to 6/6 and from 6/24 to 6/12 while the scotoma disappeared and the blind spot returned to normal. The only pathologic findings in this case were the chronic ethmoidal sinusitis. The retrobulbar optic neuritis and secondary atrophy were characteristic of the rhinogenous type of eye disease, especially in the fluctuating course. The scotoma was always most pronounced in the early morning, possibly because the nose drained better when the patient was up and about. It was noticed further that the scotoma was much less pronounced when the flow of mucopus from the nose was freest. Even if the patient proves later to have had incipient multiple sclerosis as the explanation of her retrobulbar neuritis, the search for and cure of her sinusitis rendered conditions for vision much more favorable.

115. **Acute Bulbar Paralysis.**—A man of 62 had been previously healthy except for occasional migraine. Then he had an attack of dizziness and vomiting for nearly two days but there was no headache or other symptoms. The next day he found he could not swallow. The whole act of swallowing was paralyzed. He learned to feed himself through a stomach tube and after several months a faint tendency to return of the ability to swallow is now evident. Electric treatment had been patiently applied but had not seemed to benefit.

THE ORGANIZATION OF THE MEDICAL PROFESSION FOR WAR

PRESIDENTIAL ADDRESS *

ARTHUR DEAN BEVAN, M.D.
CHICAGO

I feel greatly honored by the election to the position of President of the American Medical Association. I recognize not only the honor but also the responsibility of assuming the leadership of the organized medical profession of the country at this time. The war has made unusual and exacting demands on us. The government and the people are looking to us to furnish in this great emergency not only the necessary number of medical men for the Army and Navy, but also the highest degree of medical service and efficiency. This is proving to be a war not simply between well organized armies but between efficiently organized nations. It is now clear that in order to win the war we must organize the entire nation in such a way that every man and every woman must become a useful part of a great and powerful national military machine. No part of such a great national organization is more important than the medical profession, and on this, the opening evening of this great war meeting of American physicians, it is my purpose to address you on the organization of the medical profession for war.

ORGANIZATION OF THE ASSOCIATION

There are in the United States more than 145,000 men and women licensed in the various states to practice medicine. Of these more than 81,000 are members of the American Medical Association, and more than 45,000 are Fellows. The American Medical Association is organized along the most democratic and representative lines. No profession in this or in any other country is more thoroughly and efficiently organized than the American Medical Association. The unit of the organization is the county medical society. It is the avowed purpose of the county society to receive into its membership all reputable practitioners who are legally qualified to practice medicine. The county medical society is a democratic organization. It is not, nor is it intended to be, a select and exclusive medical society. Its functions are educational and social. It exists for the purpose of using the united efforts of the physicians of that county for the benefit of the people and for the education of its members. Any county society that is not democratic and representative is not fulfilling its proper function. By virtue of membership in the county society the physician becomes a member of his state medical society and of the national society — the American Medical Association.

During the first half century of its existence, the American Medical Association was a rather loosely organized body. It was founded for the special purpose of elevating the standards of medical education and practice. Its ideals were high, and it accomplished a great deal of good. Not, however, until its reorganization in 1901 on broad democratic and representative lines, did it become in fact the organized medical profession of the country. The American Medical Association is not sectarian, but is broad enough to include in its membership all licensed physicians who honorably practice scientific medicine.

ACTIVITIES OF THE ASSOCIATION

Since its reorganization, the American Medical Association has had a record of splendid achievement. It has succeeded in elevating the standards of medical education in this country, which had been uneven and unsatisfactory, to a position where they are as high as those in any other country. It has improved the character of medical instruction until we can now state without fear of contradiction that the medical student can obtain as thorough and complete an education here in America as anywhere in the world.

Moreover, the American Medical Association has accomplished much through its Council on Medical Education in cooperation with The Journal. Through these departments it has been of great service in creating a register of licensed practitioners. A register of medical students is now kept so that the Association possesses a full record of the medical career of each licensed practitioner and medical student.

The American Medical Association and its constituent state medical associations have succeeded in securing improvements in the medical practice acts of most of our states protecting the people against ignorant and inefficient practitioners and securing better public health service.

The American Medical Association has through its Council on Pharmacy and Chemistry done outstanding, pioneer work against the unscientific and unnecessary use of drugs and against the prescribing of secret formulas and "quack" medicines. It has done more than any other medical organization to place drug therapy on a sound and scientific basis.

The Journal of the American Medical Association has become the largest and most influential medical periodical in the world. It has a circulation of more than 65,000 copies, and in the best sense it is the instrument that keeps the profession in touch with the affairs of the Association, with scientific medicine, and through well-prepared abstracts with the current medical literature of the world.

---

* President's address before the American Medical Association at the Sixty-Ninth Annual Session, Chicago, June, 1918.

It is now more important than ever that these admirable activities of the Association should be continued and amplified, and that steps should be taken to meet the new problems that will confront the Association after the war. These will undoubtedly include the stimulation of medical research, the development of an adequate American medical literature, the creation of postgraduate medical facilities not only for our own medical men, but also for the medical men from other countries, who will find here in our great democracy a welcome and opportunities in medical instruction and medical research second to none. But these things can and must wait on the one great problem that confronts us now, *the winning of the war.*

DEMANDS MADE BY THE WAR

The problem that confronts the country in this war, as far as the development of the medical departments of the United States Army, Navy and Public Health Service are concerned, can briefly be stated in this way: If we raise an army of 3,000,000 men, 10 per cent. of this number will be in the medical department; that is, 300,000 officers and men, and of these at least 25,000 must be qualified physicians and surgeons. If we raise an army of 5,000,000 men, the medical department will contain 500,000 officers and men, and it will be necessary to have between 35,000 and 40,000 qualified medical men. At present there are more than 200,000 men authorized in the Medical Department of the Army. Of these, somewhere from 20,000 to 25,000 will be medical officers, and the balance enlisted men and nurses. If we create a navy of 500,000 we shall need 3,500 medical men. If we create a navy of a million, which is probable, we shall need 7,000 medical men. The need of the Public Health Service, although more modest, will be considerable, and must be met. No one can prophesy the extent or duration of the war, but we can say with certainty that it is the purpose of the American people to create and maintain the largest and most efficient navy in the world and to organize and train and equip an army large enough to win the war.

WHO REPRESENTS THE MEDICAL PROFESSION?

The efficient organization of the medical profession of this country for war is being splendidly accomplished by the cooperation between the Medical Departments of the Army and Navy and the organized profession, the American Medical Association. It has been unfortunate that a medical advisory committee which is not in any way representative or democratic, and which has no proper function in the efficient organization of the medical profession for war, should have been called into existence. A small coterie of specialists, of gynecologists and surgeons, no matter how eminent or how successful they may have been as promoters and exploiters of special medical societies, can in no way in this great emergency and in this great democracy represent the medical profession.

RESPONSE OF THE PROFESSION

At the outbreak of the war, the American Medical Association offered to the United States government its entire organization and machinery to assist in the enormous expansion that became necessary. Through the officers of the county societies, the state societies, and particularly through the columns of THE JOURNAL, the needs of the government were placed before the organized profession of the country, and they responded splendidly to the call. So far 25,000 have gone into the Medical Departments of the Army and Navy. No other profession or calling has responded more promptly to the needs of the country than the medical profession. The great bulk of the medical men who have gone into the government services were members of the American Medical Association.

The demands made on the medical profession by the war are so great that it is evident that in order to secure the necessary number of medical men for the government, and at the same time prevent hardships in some communities and institutions, it is necessary to organize the entire profession of the country in a systematic way. It therefore became necessary for the American Medical Association, acting with the Surgeon-General's Office, to take a census of the available medical men in the United States in each state, in each county, in each medical school and in each hospital, and to attempt to secure from each one of these different units at least 20 per cent. of the medical men. This plan will enable the government to secure the necessary number of medical officers for an army of 5,000,000 men or more, and a navy of 1,000,000 without any great hardship to any community or to any institution. It is evident that a plan of this kind is absolutely essential, and it is the purpose of the American Medical Association through its county and state societies and its national organization to create such a systematic classification and secure the adoption of this plan. Such a plan means a voluntary draft of the medical profession by the profession itself. The medical profession will supply the men needed by the government. No conscription, no compulsion will be required.

THE HONOR ROLL

The survey has been completed, and was published in THE JOURNAL, June 1. It gives the honor roll of the men who have already gone into the service from each county and state society. It gives the number of men under 45 and under 55 years of age in each county and the percentage of men who have volunteered. Up to this date about 15 per cent. of the total number of men have volunteered. The Surgeon-General of the Army has called for 5,000 more medical officers, and the Surgeon-General of the Navy needs about 2,000. It becomes necessary for us to raise the total number of medical officers this year to about 30,000, which means nearly 22 per cent. of the medical men of the country.

As President of the Association, I desire to call the serious consideration of each county medical society to the fact that in order to do its duty it should furnish at least 20 per cent. of its members for military service. This situation should be met fully and promptly by each county medical society. In order to prevent hardships to communities due to lack of medical service, and in order to prevent the crippling of medical schools and hospitals, no community and no institution, unless it is clearly oversupplied, should be allowed to furnish more than 50 per cent. of its medical men. As far as possible the quota from each county should be filled by men under 45 years of age. If this is not possible, men up to 55 will be taken. As fast as each county fills its quota of 20 per cent.—and this should be done by each county within the next few months—the secretary of the county medical society should notify the secretary of the state medical association and the secretary of the American Medical Association of that fact.

THE SUPPLY OF MEDICAL MEN

Profiting by the experience of the great nations that entered the war in 1914, the medical profession of the country, and the government, have very wisely taken steps to prevent the disruption of our medical schools, and I am glad to say that our national government adopted the suggestion made by the Surgeon-General to allow medical students to be commissioned in the enlisted Medical Reserve Corps and have them detailed to complete their medical education and to serve a year in a hospital as interns before they are called into active service. This was to apply to the men who have already studied medicine in the medical school proper for one year. In order to insure the further supply of medical students to meet the demands of a great and prolonged war, the effort is being made to have this apply also to the men who are taking their premedical work in universities. It is necessary to have these men continue their medical studies in order to insure the continued supply and the necessary number of medical men.

The United States is the only great reservoir of medical men in the world. The medical professions of Great Britain and France, of Italy and Belgium, and this is probably more true of enemy countries, have been well nigh exhausted by this war. They delayed making plans for a continued supply, their medical schools became disrupted, and they are already suffering for medical men in their armies and in their civil life. Major Horace B. Arnold, chairman of the Council on Medical Education, who is on active duty in the Surgeon-General's Office looking after the problem on medical education for General Gorgas, has this matter now under consideration, and it is to be hoped that he will succeed in securing rulings that will enable our premedical students to continue their medical courses. If the need for medical men becomes very great we can adopt a continuous session and graduate men in three years. The senior students in the medical schools should have special courses in military surgery. I would recommend that if possible one or two competent medical officers be assigned to each medical school for this purpose.

EXPANSION OF THE MEDICAL DEPARTMENT

The enormous problem that was presented to the Surgeon-General's Office by the war may be realized in a striking way by the statement that the development of an adequate medical department for 3,000,000 men means that less than 2 per cent. of such a department is represented by the men in the service at the time of the outbreak of the war — that more than 98 per cent. of the men must be taken from civil life, and must be given the necessary military training to fit them for active duty in the field. This enormous problem is being adequately and splendidly met. A small medical department which existed before the war has formed the leaven necessary to change a great body of physicians coming from civil life into efficient military surgeons and efficient hospital and ambulance units. Special training camps for medical men were formed at Fort Riley, Fort Benjamin Harrison and Fort Oglethorpe. Gradually the work done by these different camps is being concentrated at Fort Oglethorpe, where an enormous military medical university of 40,000 officers and men is being created. Here the enlisted men will receive their necessary training in small and large units, and the medical officers will receive their necessary military instruction and instruction in such medical work as will peculiarly fit them for their military duties.

GENERAL GORGAS

Standing out prominently in the development of the great Medical Department of the Army is a great figure, the figure of Surgeon-General Gorgas, who in a very quiet way has demonstrated again the fact that he is one of the greatest organizers in sanitation and in military medicine and surgery. It is most fortunate that in this emergency work of the medical department it was found in such strong and capable hands. General Gorgas is one of the great assets of this country today. The splendid work that he is doing he should continue to do throughout the war, and the organized profession of this country could do no greater service to the government than to make clear to the Washington authorities that they are unanimous in their support of Surgeon-General Gorgas, and regard him as the best man in the country for the head of the Medical Department of the Army.

General Gorgas has succeeded in surrounding himself with the strongest, most efficient men, and has shown great wisdom and judgment in placing specially qualified men at the heads of the many departments under his control. The men he has chosen from the regular corps as the heads of divisions are strong and efficient: it is only necessary to mention such men as Welch, Vaughan, Billings, Mayo, de Schweinitz and scores of others, who in civil life are the recognized leaders in their special field of work, recognized not only in this country but throughout the world.

We are equally fortunate in finding the Medical Department of the Navy in the efficient hands of Admiral Braisted, who has succeeded in meeting the great expansion made necessary by the war in the most satisfactory way.

The medical profession is also proud of the splendid service that has been rendered by the Public Health Service under the able leadership of Surgeon-General Blue.

HEALTH DURING MOBILIZATION

The mobilization of this country for war is an enormous task. To create an army of from three to five million men or more, where before we had less than 100,000, and create a navy of from 500,000 to 1,000,000 is an undertaking that had never before been worked out by any country. It was necessary that this enormous mobilization should be done as rapidly as possible, and from the rapidity and the enormous size of the mobilization it was inevitable that the medical organization could not accomplish the impossible and secure at once ideal results. Yet when we compare the mobilization of the United States for war with other countries we find cause for congratulation. Up to the time of our mobilization the army of Japan had held the record for the lowest mortality of any country during mobilization, and the best care of its soldiers from a medical standpoint. In the Japanese mobilization there was a mortality of 20 per thousand. In our mobilization there has been a little less than 10 per thousand. In other words, the showing of our mobilization from the standpoint of mortality was twice as good as the record held by any country up to that time. There have been epidemics of contagious diseases, such as measles, mumps and meningitis, and the total number of cases occurring among 2,000,000 men has been somewhat startling; but when these facts are analyzed and it is found that the mortality in our army is less than the mortality in civil life of the same number of men of the same age, picked by insurance companies, we can realize what splendid results have been accomplished.

The people of this country, the mothers and fathers and wives, whose sons and husbands are in the Army and Navy, are entitled to know, and it will be a great comfort to them to know, that the health of these men is better looked out for than when they were in civil life, that the dangers that they run from disease are less than when they were in civil life, and that when they are sick or wounded they will receive as good care, as high a class of medical and surgical service, as could possibly be obtained in civil life. This is true because our best men have gone into the medical service, and the government is providing the medical departments with every facility necessary to give our soldiers the best medical care.

THE VENEREAL PROBLEM

Strikingly successful has been the handling of the venereal problem. A careful examination of the evidence shows that venereal disease is only about half as frequent in men after they enter the Army as in similar groups of individuals in civil life. Certainly no army has ever been mobilized which has been as clean morally and free from venereal disease as the present American Army. Associated with this fact and responsible in large part for the splendid showing made is the elimination in large part of drink from the Army. Certainly no army has ever been mobilized that has been as free from drinking as the American Army. It was fortunate that our mobilization occurred at a time when the amount of drinking in this country was rapidly diminishing, and at a time when most of our states were going on a prohibition basis. Special efforts have been made by the government in the way of laws that have been enacted for this purpose to prevent drinking in Army posts and in territory immediately contiguous to them. This leads me to a consideration of the problem of drinking and prohibition as a purely medical problem.

NECESSITY OF ELIMINATING DRINK

As we analyze the facts in a scientific and medical way there can be no doubt of the injurious effects of alcoholic drinks on both the physical and the mental well-being of our population. There can be no doubt that the greatest single factor that we can control in the interests of the public health of the nation would be the elimination of alcoholic drink.

In the slow evolution of civilization, many great wrongs persisted for centuries because people had become so accustomed to them that they were accepted as matters of course. They became so intrenched that it required either centuries of education or a revolution to extirpate or right them. Great epidemics and plagues were accepted as inevitable and as visitations of God. Government by autocratic power and divine right without the consent of the governed has been tolerated. Slavery with its horrors was defended. The unequal rights of women went unquestioned. Among these great wrongs too long tolerated, none has done more injury to mankind than drink. Events now are moving rapidly in the convulsions of a world war. Women have demanded and will obtain, as they deserve the world over, their equal rights. The course of events is writing the death warrant of autocracy and rule by divine right; and science and education should eliminate not only the plagues and epidemics but also the curse of drink from the world.

I want to plead for the united action of the organized medical profession of this country to secure protection by law against the injury that drink is doing to our people, not as a political measure, but as the most important public health measure that could be secured. In this crisis when we and our allies are fighting not only for ourselves but also for humanity and civilization, we must organize the entire nation in the most efficient possible way, and this cannot be done without eliminating drink. Each member of the medical profession as an individual, each county medical society, each state medical society should take an active part in the propaganda against drink, and secure national prohibition, not years from now but now when it is so badly needed and will accomplish so much good, not only for our boys in khaki and in blue, but for the nation in arms. And when it has once been done away with, it could no more be resurrected after the war than could slavery.

THE NURSES

One of the serious problems now confronting us is the securing of the necessary number of women nurses for our Army and Navy hospitals. We shall need from 25,000 to 40,000 women nurses. These cannot be secured from the trained and registered nurses of the country and leave a sufficient number of nurses to care for our civilian population. It requires three years of training in times of peace to educate a nurse. But we must remember that in peace times it requires a four years' training at West Point and Annapolis to make an officer of the Army or Navy. In the emergency of this war we are developing splendid officers from well educated, capable men taken from civil life, by intensive short three months' courses in our officers' training camps. The same plan should be adopted in securing the necessary nurses.

There are thousands of well educated, capable young women in this country who are not only willing but are anxious to offer their services to the country. Nurses' training camps and training schools can be developed in our Army and Navy cantonments where, with an intensive three months' training, these young women can be developed into most useful war nurses, and meet the needs of the government. The Surgeon-General of the Army has already taken steps to encourage these nurses' training schools.

RECONSTRUCTION AND REEDUCATION

Another great problem confronting us is the reconstruction and reeducation of our wounded coming back from the war. Our allies after four years of war, bringing with it hundreds of thousands of cripples, have demonstrated what great good can be accomplished by reconstruction and reeducation. The injured man is reeducated to do some useful work. He is not allowed to drift as a useless wreck, a burden to himself and the community. He is recalled to life by a process of training and reeducation that enables him to earn his livelihood, to occupy his mind and to make life — even with a handicapped body — worth living. Surgeon-General Gorgas has been fortunate in securing as the head of this important reconstruction work our own Dr., now Colonel, Frank Billings, who will have the earnest support of thousands of men and women throughout the country in making this work successful.

DRUGS AND CHEMICALS

An organized effort should be made by the medical profession of the country to secure the creation and maintenance of industries for the production in this country of the necessary drugs and chemicals, surgical instruments and appliances, making this country independent in productions of this kind from other countries of the world. The securing of such legislation by the national government as will protect by proper tariff these industries in the process of development is essential. With the 145,000 medical men in this country, with the population and wealth of this country, we are the largest market in the world for drugs, instruments and medical appliances. By proper legislation, industries could be developed so that these products could be made here as cheaply as anywhere in the world, in such quantities as not only to supply our own market but also to enable us to enter other markets and maintain commercially our position in the western hemisphere, especially in this country and in South America.

HEALTH OF THE CIVIL POPULATION

One matter which the profession should not lose sight of in endeavoring to meet the great demands made by war is the health of our civil population. The importance of maintaining and increasing and making more effective a national Public Health Service with wide authority, of developing in each county and each state strong public health departments, cannot be questioned. We should demand such state and national organizations for public health and preventive medicine that will secure for our people in a much better way than at present the great possibilities of modern preventive medicine. The war makes this matter not less but more important.

ONE HUNDRED PER CENT. LOYALTY

In organizing the medical profession of this country for war there is one fundamental and basic condition that must be secured: We as a profession must go into this war not only efficient, but we must go into it 100 per cent. loyal, 100 per cent. American. We are at war with a barbarous and brutal autocracy. The American people did not want to enter the war. It was only after the Imperial German Government had murdered our people and destroyed our property and treated our repeated protests with contempt that we prepared to defend ourselves against Germany, as an individual must against a murderer, a highwayman, a thief. We are at war with Germany and Austria. The Germans and Austrians who have chosen to make this country their home must choose between the land of their birth and America, the land in which their children are born. The choice with most of them has not been difficult. They have chosen their new home, the birthplace of their children, and these men and women we accept gladly as loyal Americans. But there are a few who are disloyal and would give aid and comfort to the enemy, and these must be sought out and interned where they can do no harm. It is the duty of every medical man and each county medical society to assist the government in securing the arrest and internment of every disloyal member of the medical profession.

There are in this country some German medical societies, and attention of the government authorities should be called to these. They should be disbanded at once. We should not permit, now, or in the future, in this country any organizations that further German propaganda. The world has had its lesson with this monstrous thing.

THE INTERNATIONAL FELLOWSHIP OF SCIENCE

The American medical profession as a whole is more familiar with Germany and the German and Austrian people than is any other class of our countrymen. Thousands of our medical men have studied abroad in the clinics and laboratories of Great Britain and France, of Germany and Austria, of Switzerland and Italy. No other class of people in the world has felt more fully the international brotherhood of science than have American medical men. They have regarded scientific knowledge and scientific discoveries as the property not of one nation but of the world. They have accepted the great discoveries, such as Jenner's of vaccination, the American discovery of anesthesia, the work of Pasteur the great Frenchman, the work of Lister the great Englishman, the work of Koch the the great German, the German discovery of the roentgen ray, the French discovery of radium, the American discovery of the manner of transmission and means of preventing the spread of yellow fever and typhus. They have accepted these and rejoiced that these great discoveries belonged not to one nation or one people, but were contributions to the great international science of medicine. What effect has the war had on this international fellowship of science?

OUR ATTITUDE TOWARD THE GERMAN MEDICAL PROFESSION

I believe we owe it as a duty to ourselves and to the German medical profession to state clearly the feelings and position of the American medical profession toward them. We can never again hold out to them the right hand of the fellowship of science until the German people drive from power and punish as they deserve the brutal and barbarous autocratic government which is responsible for this war, and has created in Germany a government of the people, by the people and for the people. No matter what doubt or confusion there may have been at the outbreak of the war as to the guilt of the German government, the responsibility is today fixed and definite. The refusal to attempt a peaceful settlement before hostilities began, the outrage of Belgium, the invasion of France, the breaking of all international law, the sinking of the *Lusitania*, the evidence and revelations of the long prepared and worldwide plot of Germany to dominate Europe and the world by force of arms, the evidence furnished by the German ambassador to England, Prince Licknowsky, the deliberate attempt of the German government while we were still at peace with Germany to embroil us in war with Mexico and Japan, the murder of Edith Cavell, the use of poisonous gases, the bombing of unfortified towns and cities, the acquiescence in the massacre of the Armenians by their Turkish allies, have all written with the indelible pencil of truth the history of German guilt.

No matter what sophistries the German people may advance as excuses for these things and for their precipitating war on Belgium, France, England and Russia, we know that these cannot apply to America. We know that there is not a shadow of excuse for their making war on the American people. It required repeated outrages to convince the American people that the German government was a thing without honor, that we were face to face with a highly organized and efficient autocracy which recognizes no law but the law of the jungle, an autocracy and a people who would rob their neighbors of their fair fields and their factories, their iron mines and their oil wells, an autocracy and a people who combine the frightfulness and moralities of the Hun with science and efficiency of the twentieth century, an autocracy and a people that have been seized with the insane egotism that they are God's chosen instruments to civilize and "kultur" the world, not by education and science, but with the mailed fist and the sword.

To medical men who are accustomed to study diseased bodies and minds, this state of mind of the German government and the German people seems like the insanity of a whole nation. We medical men are familiar with a horrible disease, which begins with an initial lesion acquired in a debauch and which ends often in insanity with delusions of grandeur and magnificence. It would seem as though the German nation was suffering from such a disease, from such a form of insanity. It acquired its initial lesion in the rape and outrage of Denmark, of Austria and of France in the decade between 1860 and 1870. The virus of conquest and domination has coursed through its veins for more than fifty years, and has produced now a diseased national mind with the delusions of egotism and grandeur that are responsible for this world's war.

When the German people waken from the nightmare of the war, they must realize the enormity of the crime they have committed under the spell of the medieval autocratic government that controlled them. They will realize that although they might retain with profit to themselves a province stolen from Denmark or Poland, France or Belgium, they can never dominate with force of arms with profit to themselves for any length of time great nations like Russia and France, England, Italy, Japan and America. We are in this war, as our great President has said, "to make the world safe for democracy;" and whether it takes one year or ten years, we shall continue the war until the brutal and barbarous autocracy of Germany is destroyed. If the German people could have but a brief period of freedom from their war madness, let them ask themselves if the few miles of Belgium and France and the occupied provinces of stricken Russia can compensate them for making nine tenths of the world their bitter enemy. And they should be made to know that this is not the enmity of a day, the enmity that will disappear with a peace that they hope to compel by force of arms, but that it is an enmity that will last, that will mean for Germany a complete severance of relations, social, commercial and in every way from ourselves and our allies until Germany has purged itself of guilt, and asks humbly for a place among the nations in which the people rule. The medical profession of America sends this message to the medical profession of Germany.

OUR SINGLE PURPOSE AS A NATION

To the medical professions of Belgium and France, of England and Italy, of Russia and Greece, of Portugal, Roumania, China and Japan, of Brazil and the Central American Republics, to our colleagues in Canada and Australia and New Zealand and South Africa, and to the other nations who in response to German outrages have joined in war against her, we send a message to hold fast and be of good cheer. We have been a peace loving people, we loathe war, we have done everything a nation could in honor do to avoid war, but our people have been murdered by the German government and the German people, and we protested and they murdered more, and we protested and they murdered more, and we have been forcd to defend ourselves and our rights. We have not been a military nation. We have been unprepared for a great war. But we have absolute confidence in the ultimate success of our democratic form of government. We believe that it is not only the best form of government in peace, but that it can be made the most efficient and best organized form of government in a great war. Let us tell our medical colleagues in the nations who are now our allies that America with its more than hundred million free men and women is organizing itself into a great military machine, that all our people, that all our resources, that everything we have is being converted as fast as brains and energy and money can convert them into a weapon with which to win this war, which is now our war. Let us tell them to hold fast and be of good cheer, for America is coming.

America asks nothing for herself. She comes with a clear conscience, a sane national mind, a stout heart and a strong arm. She comes with the single purpose of a united people, a hundred million strong, to punish the murderers of her people and to win this war for civilization and humanity.

Let us send from this meeting of the organized medical profession of America to our great leader in Washington a message, the message that wells up from every farm and factory, from every town and hamlet, the message that echoes and reechoes through our country, from the mountains through the valleys to the sea, the message that is sent by every man and woman of America when our government calls for their services in this war:

We hear the call of our country. We answer, we are here.

THE EFFECT OF TYRAMIN ON CIRCULATORY FAILURE

DURING INFECTIONS AND DURING OR AFTER OPERATIONS *

A. W. HEWLETT, M.D.
Surgeon, U. S. Naval Reserve Force

AND

W. E. KAY, M.D.
SAN FRANCISCO

The action of tyramin[1] on the normal circulation of man has been considered in a previous paper.[2] After the subcutaneous injection of a full therapeutic dose (from 60 to 80 mg.), the systolic blood pressure usually rises to levels of from 150 to 200 mm. The pressure begins to rise within five minutes after the injection, attains its maximum in about ten minutes, and subsides more gradually to its previous level, which is usually reached in from fifteen to thirty minutes. The diastolic pressure frequently rises also, but never to any great extent. The volume pulse in the arm becomes larger and more sustained. The heart rate becomes somewhat slower, and extrasystoles occasionally occur. These circulatory changes, except for being more prolonged, resemble those which follow the intravenous injection of epinephrin in moderate doses. Subcutaneous injections of epinephrin, on the other hand, rarely cause any marked rise of systolic

[1] "Tyramin" is the short term for "tyramin hydrochlorid."

[2] Hewlett, A. W.: The Action of Tyramin on the Circulation of Man, Arch. Int. Med., March, 1918, p. 411.

pressure and not infrequently lower the diastolic pressure.

Despite the fact that tyramin injections consistently raise the systolic blood pressure of man, we find in the literature but few instances in which they have been used clinically for the purpose of combating a failing blood pressure. Hoyt[3] recorded one case of advanced tuberculosis with marked circulatory weakness in which the systolic pressure was raised from 85 to 130 mm. by the injection of 40 mg. of tyramin. Clark[4] injected tyramin on two occasions into a patient showing collapse after an operation for a ruptured gastric ulcer, and after each injection the systolic pressure showed a transient rise, from 60 to 72 mm., without, however, preventing a fatal termination. In a second patient, showing collapse after hemorrhage from septic wounds, Clark raised the systolic pressure for a short time from 100 to 112 mm. The patient died some days later.

In the present paper we wish to place on record additional observations on the effects produced by the subcutaneous injection of tyramin during the circulatory failure of infectious diseases as well as during that which may occur during or after operations. A few attempts to abort asthmatic paroxysms with this drug will also be reported.

TYRAMIN IN THE CIRCULATORY FAILURE OF INFECTIONS

In the following cases of infection the patients showed a serious circulatory failure previous to the administration of the drug. Such failure is characterized by a rapid, small and poorly sustained pulse and by a subnormal blood pressure.

Case 1 (Hospital No. 58260).—In a patient, aged 69, with double lobar pneumonia 40 mg. of tyramin were injected at 1:30 p. m., Sept. 19, 1917, without appreciable effect on the pulse or the blood pressure. At 4 p. m. a second injection of 80 mg. was given. Ten minutes later the systolic pressure had risen from 100 to 110, the diastolic pressure was still 58, and the pulse had increased from 85 to 100, the pulse feeling a little fuller. Twenty-five minutes after the injection the circulatory condition had returned to its previous state. The patient died early on the following morning.

Case 2 (Hospital No. 58632).—In a patient, aged 57, with lobar pneumonia complicated by malaria, the blood pressure at 1 p. m. was 85 systolic and 60 diastolic, and the pulse was 140 per minute and barely perceptible. Five minutes after the injection of 80 mg. of tyramin, the pressures were 110 systolic and 60 diastolic, and the pulse was 145 and somewhat more easily felt. Fifteen minutes after the injection the blood pressure and pulse had returned to the original condition. At 2 p. m. the pulse could not be felt, nor could the blood pressure be read. The injection of 80 mg. of tyramin at this time did not produce any evident change. The patient died half an hour later.

Case 3 (Hospital No. 60120).—In a patient, aged 28, with typhoid fever, Nov. 20, 1917, the blood pressure was 85 systolic and 65 diastolic, and the pulse was 120. Sixty mg. of tyramin were injected. Five minutes later the blood pressure had risen to a maximum of 115 systolic and 70 diastolic, and twenty minutes later it was 100 systolic and 70 diastolic. November 21, the patient became cyanotic, the pulse was imperceptible, and the blood pressure could not be recorded. Three minutes after the injection of 60 mg. of tyramin, the pulse could be easily felt, and the blood pressures were 95 systolic and 65 diastolic. Half an hour later the pulse was still palpable. The improvement in the patient's general condition following this injection was very striking and was commented on by the attendant nurses. November 22, the blood pressures were 80 systolic and 60 diastolic; the pulse was 126 and very small. Four and ten minutes after the injection of 60 mg. of tyramin the blood pressure was 100 systolic and 60 diastolic, and the pulse was larger. Twenty-five minutes after the injection the pressure was again 80 systolic and 60 diastolic. The patient died, November 23.

Case 4 (Hospital No. 60216).—A man, aged 38, with typhoid fever, was unconscious when admitted to the hospital, and the pulse could not be felt. Five minutes after the injection of 60 mg. of tyramin the pulse could be counted, 150 per minute. It remained palpable for about an hour, when it again became imperceptible. A second injection of 60 mg. had the same effect as the first. During the following thirty-six hours the drug was given whenever the patient became pulseless, usually at intervals of one to one and a half hours. Up to the last two hours before the patient's death, each injection was followed by a return of the pulse and some improvement in the general condition. The last one or two injections, however, produced no effect.

From these observations it is evident that in the circulatory failure which may complicate infections, the subcutaneous injection of tyramin causes at times a transient rise of blood pressure and an increase in the size of the pulse. These effects were neither so marked nor so constant in the circulatory failure of infections as they were when the drug was injected into individuals with normal circulations (compare with the results, recorded by Hewlett[2]). Furthermore, the drug was often ineffective shortly before the death of the patient. Occasionally, as in the second injection given in Case 3, the change in the circulation was accompanied by an evident improvement in the general condition of the patient. The effects of the drug, however, were transitory, and in our cases the final outcome was not influenced. Indeed, it is to be expected that when the underlying cause of the circulatory failure is progressive in character, no drug which merely corrects this manifestation is likely to save the patient. At the same time it is conceivable that under exceptional circumstances the temporary improvement in the circulation might prove of decisive value in enabling the patient to overcome the infection.

TYRAMIN IN THE CIRCULATORY FAILURE DURING AND AFTER OPERATIONS

Case 5 (Hospital No. 59183).—A man, aged 30, after the resection of a rib for pyopneumothorax following lobar pneumonia, became cyanotic and pulseless. Sixty mg. of tyramin were injected. In five minutes the pulse had become palpable and in ten minutes it was full, rapid and of fair tension. The patient's general condition was strikingly improved. Forty-five minutes later, when the pulse was again becoming smaller, a second injection of 60 mg. was given, and again the condition of the pulse improved. Thereafter it remained rapid but of fair size, and the patient eventually recovered. Dr. Philip Gilman, who had operated on this patient, expressed the opinion that the tyramin had saved him from a seemingly fatal collapse.

Case 6 (Hospital No. 58232).—In a woman, aged 38, following a hysterectomy for fibroids and secondary anemia, the pulse became almost imperceptible. About five minutes after the injection of 60 mg. of tyramin, the pulse became full and of good tension. The patient complained of cardiac palpitation. The pulse remained good, and the patient recovered.

Case 7 (Hospital No. 60847).—A woman, aged 45, was much emaciated and weak. A panhysterectomy was performed for tuberculosis of the ovaries and tubes. Midway in the operation the pulse became barely palpable, with a rate of 130 per minute. The systolic pressure was 60 mm. Three minutes after the injection of 60 mg. of tyramin, the pulse became distinctly palpable, fuller and somewhat slower

[4] Clark, A.: The Clinical Application of Ergotamine, Biochem. Jour., 1910-1911, 5, 236.

(120 per minute). The blood pressure rose to 100 systolic and 65 diastolic. The pulse remained palpable for about twenty-five minutes, at which time it became imperceptible and the blood pressure could not be determined. A second injection of 60 mg. caused the pulse to become palpable again. Ten minutes after the injection the pressure was 80 systolic and 55 diastolic, and twenty minutes after it was 60 systolic. Twenty-five minutes later the blood pressure could not be read. Owing to the serious condition of the patient, the operation was terminated. While Hogan's gelatin solution was being prepared, another 60 mg. of tyramin was injected. Within four minutes the blood pressure was 70 systolic and 55 diastolic, and the pulse could be counted, 150 per minute. Five hundred c.c. of Hogan's solution were then given intravenously, and the pulse remained palpable for an hour, the blood pressure being 55 systolic and 45 diastolic. The patient's condition gradually grew worse. Injections of 60 mg. of tyramin caused the pulse to reappear on several more occasions, but were ineffective during the last hour before death, which occurred eight hours after the patient had left the operating table.

Case 8 (Hospital No. 61230).—A patient, aged 22, following exploratory operation for cerebellar tumor, returned to the ward with a pulse that was barely palpable and 150 per minute. Sixty mg. of tyramin were injected subcutaneously. Within three minutes the pulse became fuller and slower (120 per minute). The blood pressure, which could not be read previously, was now 85 systolic and 55 diastolic. Thirty minutes later the pulse again became very small, and 500 c.c. of Hogan's solution were given intravenously. There was temporary improvement in the patient's condition. The pulse remained palpable for forty-five minutes, with a rate of 150 per minute. The blood pressure was 70 systolic and 50 diastolic. Death ensued two hours later.

Case 9 (Hospital No. 9469).—In a patient, aged 38, following a cholecystectomy, the pulse was barely palpable, and its rate was 160 per minute. The blood pressure was 100 systolic and 60 diastolic. The patient was cyanotic. Four minutes after the injection of 60 mg. of tyramin the pulse became fuller and of greater tension, the pressure being 130 systolic and 70 diastolic. Twenty minutes later it was 115 systolic and 65 diastolic, the pulse rate being 120. The pulse continued to be of good quality, and the patient recovered.

Case 10 (Hospital No. 9609).—A patient, aged 38, following the incision of multiple abscesses attended by considerable loss of blood, returned to the ward in a state of circulatory collapse. The pulse was scarcely felt and 150 per minute; the blood pressure was 95 systolic and 55 diastolic. Four minutes after the injection of tyramin, the pulse became easily palpable, with a rate of 120, and the blood pressure was 130 systolic and 65 diastolic. There was an evident improvement in the patient's condition which aroused enthusiastic comment from the attending intern. In ten minutes the blood pressures were 120 systolic and 65 diastolic, with a pulse rate of 120 per minute. The pulse remained easily palpable for half an hour, when it became less full and strong. Five hundred c.c. of Hogan's solution were then given intravenously with benefit. The patient recovered.

Case 11 (Hospital No. 61011).—A patient, aged 22, following an operation for the removal of an extensive neurofibromatous growth of the legs, returned to the ward in a condition of circulatory collapse. There was cold perspiration over the body. The pulse was barely perceptible and 160 per minute. The blood pressure was 50 systolic and 30 diastolic. Four minutes after the injection of 80 mg. of tyramin, the pulse became easily palpable and 130 per minute. The blood pressure rose to 95 systolic and 55 diastolic. Five minutes later it was 75 systolic and 55 diastolic. There was an evident improvement in the patient's general condition. One hour later the pulse had again become small, and the blood pressure had fallen to 65 systolic and 45 diastolic. A second injection of 80 mg. of tyramin was given, which again caused a distinct improvement in the general condition of the patient, and a rise of pressure to 95 systolic and 50 diastolic. The patient continued to improve, and recovered from this threatening circulatory collapse.

In these patients with circulatory failure during or after surgical operations the injection of tyramin usually caused a transient but marked improvement in the pulse, the blood pressure and the general condition. As in the circulatory failure of infectious diseases, the rise of blood pressure was less marked than that caused by the injection of tyramin into individuals with a normal circulation. The circulatory failure that occurs during or after operations differs from that complicating the infectious diseases in that the underlying cause is less often progressive. For this reason a temporary improvement of the circulation may lead to lasting results, and in Cases 5, 6, 9, 10 and 11 the immediate improvement caused by the drug was followed by ultimate recovery. It cannot be demonstrated that tyramin saved the life of any one of these patients, for we do not know what would have been the ultimate outcome had tyramin been omitted. Nevertheless the opinion prevailed among those who attended these patients that in Cases 5, 10 and 11 the outlook was unfavorable and that tyramin saved the life of one or more of them.

Of drugs ordinarily given in order to combat the circulatory failure that may supervene during or after operation, none have withstood the test of investigation by accurate methods. In therapeutic doses, strychnin appears to exert no influence on the circulation; in normal men, at least, caffein tends to lower the blood pressure; therapeutic doses of camphor have little if any action on the circulation, and subcutaneous injections of epinephrin usually fail to cause any rise in the mean blood pressure. Intravenous injections of epinephrin raise the blood pressure, but the effect is very transitory and difficult to control, and they have not been generally used. Most surgeons in treating this type of circulatory failure rely mainly on the application of heat externally and the addition of fluid to the body either by rectum, by hypodermoclysis, or by the intravenous injection of various solutions or of whole blood. Over most of these methods tyramin possesses the advantage of a simple technic and a rapid effect. The rise of pressure begins within five minutes and usually reaches its maximum in about ten minutes. It may be given while preparations are being made for intravenous therapy.

One possible danger from tyramin should be mentioned. Even in those with a normal circulation this drug may cause extrasystoles, and when extrasystoles are already present it may increase their number.[2] Since a rapid succession of ventricular extrasystoles may pass on into ventricular fibrillation, it is possible that tyramin, like intravenous injections of epinephrin, may occasionally cause a fatal ventricular fibrillation, particularly in those whose heart muscle is in an unusually irritable condition. For this reason the drug should not be administered when frequent extrasystoles are present. During chloroform anesthesia also the foregoing danger is increased, for we know that in animals chloroform in proper doses may provoke a fatal ventricular fibrillation, and it seems probable that the sudden cardiac deaths which occur occasionally during surgical operations under chloroform are due to this cause.

FAILURE OF TYRAMIN TO ABORT ASTHMATIC PAROXYSMS

It is well known that many asthmatic paroxysms may be aborted by the injection of epinephrin. Baehr and Pick[5] found in animal experiments that while epinephrin caused a dilatation of the bronchi, tyramin had the opposite effect. Despite this unfavorable experimental evidence, it seemed worth while to test the action of tyramin on paroxysms of asthma. As the following cases show, the drug has little, if any, beneficial effect under such circumstances.

Case 12.—A medical student, aged 24, had been frequently relieved by epinephrin in previous attacks of asthma. During an asthmatic seizure, 60 mg. of tyramin were injected subcutaneously. The blood pressure rose from 125 systolic and 70 diastolic to 190 systolic and 80 diastolic, but no relief was obtained from the dyspnea. One c.c. of epinephrin solution (1:1,000) was then administered subcutaneously, and the paroxysm subsided. As on previous occasions, however, the patient complained of tremulous sensations, palpitation of the heart, etc., symptoms which did not occur after the administration of tyramin.

Case 13 (Hospital No. 52993).—A patient, aged 37, during a severe attack of asthma was given 60 mg. of tyramin subcutaneously, with no effect on the symptoms. Before the injection the blood pressure was 140 systolic and 100 diastolic, with a pulse of 96 per minute. Five minutes after the injection, the blood pressure was 160 systolic and 110 diastolic, with a pulse of 100. One c.c. of epinephrin solution gave almost immediate relief. The patient complained of nervous sensations and cardiac palpitation, symptoms not experienced after the tyramin.

Case 14 (Hospital No. 56014).—A patient, aged 26, was admitted to the ward during an acute attack of asthma. Sixty mg. of tyramin were injected with no effect on the symptoms. Thirty minutes later 1 c.c. of epinephrin solution was injected which gave temporary relief. The attack was finally controlled by morphin and atropin.

Case 15 (Hospital No. 40930).—A patient, aged 35, suffering from a paroxysm of asthma, was given 60 mg. of tyramin subcutaneously. There was no relief from the symptoms. Epinephrin given twenty minutes later also failed to control the attack. The patient was relieved by atropin.

Case 16 (Hospital No. 39864).—A patient, aged 38, during an asthmatic attack was given 80 mg. of tyramin with no relief. Before the administration the blood pressure was 148 systolic and 80 diastolic, with a pulse of 80 per minute. Five minutes after the injection the blood pressure was 180 systolic and 100 diastolic, with a pulse of 78 per minute.

SUMMARY

1. In four patients who showed evidence of circulatory failure during the course of infectious disease, repeated injections of tyramin were given. These usually caused a transient rise of blood pressure and an increase in the size of the pulse. These effects were less marked than those produced when the drug was given in similar doses to those with a normal circulation. In none of our cases did a permanent improvement occur.

2. In seven patients who showed evidence of circulatory failure during or after operation, repeated injections of tyramin were given. These usually caused a transient rise of blood pressure and an increase in the size of the pulse. Striking improvements in the general condition of some of these patients occurred. Five of the seven patients recovered, and in three of these the drug benefited a condition which to those in attendance seemed desperate.

3. In five patients, tyramin failed to abort asthmatic paroxysms, although other drugs (epinephrin and atropin) were subsequently used with benefit.

A BACTERIAL TOXIN AS THE CAUSE OF RETINAL HEMORRHAGE

F. PARK LEWIS, M.D.
BUFFALO

In the summer of 1917, a case of retinal hemorrhage came under my observation which illuminated the heretofore obscure etiology of this condition. It made definite that which, in such conditions before, had been vague. It determined causes which could be corrected, and it made precise, measures of treatment which before had been speculative. Its importance, therefore, would seem to warrant a brief report with the deductions to which it gives rise. It is briefly as follows:

A woman in middle life had been having a series of recurrent hemorrhages in the retina for a period of eight months. During this time she had been under the advice and observation of an excellent internist and an ophthalmologist of international reputation. The treatment, therefore, might reasonably be accepted as fairly expressive of that which the best professional skill would approve. It consisted of elimination through the kidneys by saline cathartics and through the skin by baths. The hemorrhages continued to recur, however, and when she was examined, patches of blood were found scattered in the vicinity of the larger vessels, with a number of minute spots near the macula which had materially reduced the acuity of vision. As this is not a technical report of the case, the exact ocular details need not here be given. It was found, however, that she was only 46 years old, that she had no arteriosclerosis, and that her blood pressure was only 120 mm. of mercury, but that she had marked leukocytosis. She had no disease of the kidneys and was apparently, aside from the eyes, in excellent health.

Further inquiry elicited the fact that five years before she had an abscess of the antrum which had seemingly recovered. She was referred to a rhinologist, however, who opened the antrum and removed a quantity of bland, sterile pus. Pyorrhea was evident to the least critical observer, while roentgenograms revealed the presence of apical abscesses of several teeth with rarification of the alveolar tissue. The infected teeth were removed with aseptic precautions and a culture made by Dr. Thibaudeau, pathologist of the Children's Hospital, Buffalo, which showed that the active organism was the *Streptococcus hemolyticus.* The removal of the source of infection was followed by a cessation of the hemorrhages, although the destruction of retinal tissue had been so great that vision was not materially improved.

In a subsequent case of recurrent hemorrhage in a man, aged 70, with a blood pressure of 200, again an infected tooth was suspected after various other measures had been ineffectively used. Its evidence was verified, and again the active organism proved to be the *Streptococcus hemolyticus.* An autogenous vaccine was prepared and employed at intervals of four days for six weeks. Since that time, now about six months, there have been no further hemorrhages. In almost every case since in which hemorrhage of the eyeball has been present, some form of focal infection has been found, and the active organism has usually been some form of the streptococcus and almost invariably in recent examinations the *Streptococcus hemolyticus.*

Retinal hemorrhage is of much more frequent occurrence than it is generally supposed to be. It is not dependent on blood pressure. It may be associated with, but is not directly caused by, arteriosclerosis, albuminuria, diabetes or other diseases involving disturbed metabolism or focal infections. In any of these conditions, protein toxins may be given off. These are easily absorbed into the circulation, more especially when they arise from focal infections that are proximal to the eye. The organism which is most commonly present is the streptococcus, and the form frequently found is that of the *Streptococcus hemolyticus*. The hemorrhage thus produced is not the result of force from behind, but is due to softening of the tissues of the capillary or arterial walls by the local action of this toxin, thereby producing lysis.

[5] Baehr, G., and Pick, E. P.: Pharmakologische Studien an der Bronchialmuskulatur der überlebenden Meerschweinchenlunge, Arch. f. exper. Path. u. Pharmakol., 1913, **74**, 41.

This conception has not heretofore been recognized as a cause of retinal hemorrhage, and the reasons for the conclusions reached will be briefly given. The importance of the subject will at once be evident, as in a proportion of cases, at least, a definite etiology and one which clarifies the entire situation will be established in place of one which is vague and speculative. It explains satisfactorily many pathologic changes otherwise obscure, and gives definite and specific methods of procedure which, if determined early enough, may have a preventive value, in conditions not only endangering sight but even life itself. That our fundamental knowledge of the cause of retinal hemorrhage is still exceedingly indefinite is shown in a review of our most recent literature. In an exhaustive article from the pen of Professor Eperon,[1] the conclusion reached is that while the causes given are arteriosclerosis, albuminuria, glycosuria and menopause, still, "it is somewhat misleading to regard hemorrhagic retinitis as a single clinical entity—it is a symptomatic condition which must be evaluated according to concomitant factors."

Dr. Clegg[2] has confessed that "he is quite at a loss to know the explanation of retinal hemorrhage in spite of all of the suggestions made in literature," and he believes especially that "the known methods of treatment are by no means reliable, nor is it even always at once evident which line of treatment will best suit an individual case." In one of the latest and most authoritative textbooks[3] it is accepted without further comment that "while most cases of retinal hemorrhage are due to arteriosclerosis, diabetes, chronic nephritis, etc., there are also a large number which have no discoverable cause." Parsons[4] makes no attempt to describe the conditions which produce retinal hemorrhage.

It is generally assumed by ophthalmologists that one or two conditions obtain or that the two at the same time may be present—either that the internal pressure becomes so great that it can no longer be resisted by the retaining wall of the blood vessel, which consequently ruptures, or that through change of structure the vessel wall becomes so weakened that the normal pressure can no longer be resisted. Little attention has been given, as to the manner in which these structural changes take place, or on what they are dependent. This is vitally important because on its understanding is based our whole conception of the actual etiology, and therefore prognosis and treatment. It is here urged that that which actually occurs is the absorption into the blood of a soluble protein poison, usually given off from a focal infection, which has a solvent effect on the intercellular cement substance of the cell wall, and that the hemorrhage is not due to alteration of the blood pressure but to local lysis in the wall itself. That this view is not that which is commonly entertained is evidenced by a writer[5] who, in urging the more general use of the sphygmomanometer, says that "while tuberculin is needed in many of these cases, in addition thereto means must be resorted to to reduce the blood pressure or to make it compensate." The editorial comment on this is: "While recurrent retinal hemorrhage may be accompanied by low blood pressure, as was pointed out by the late E. W. Stevens twelve years ago, its association with variations of coagulability of the blood should also be studied. It may occur with high coagulability as well as with low." This leads to the inevitable conclusion that neither the blood pressure nor the coagulability is the essential factor to be reckoned with, but that back of this is another element which has not yet been recognized.

Happily the investigations of Vaughan and Wheeler in 1903 in which they demonstrated that the colon bacillus contains a highly active poison was epoch making and vitally important in this connection. In their subsequent studies they isolated from other bacteria a toxic substance which came to be known as the "protein poison." When undigested proteins are introduced into the blood current, this virulent poison is set free, the body becomes sensitized, and death may result without bacteria entering into the active process. They are, however, the source from which the toxin is derived. The poison thus given off from a focal nidus is slowly absorbed, and disturbing local effects result.

The differential character of the toxins given off by the different strains of bacteria has not yet been studied. It is known, however, that several varieties produce hemorrhage. The effect is not unlike that of the snake venoms, which Flexner has shown contain a chemical substance having a definite endotheliotoxic action or a solvent effect on the intercellular substance. Wells considers it quite probable that of the chemical agencies causing hemorrhage the bacterial products are the most important:

> It is quite probable that the bacterial poisons that cause marked hemorrhagic manifestations likewise contain endotheliotoxins. . . . Hemorrhage in cachectic conditions is often ascribed to changes in the vessel walls due to malnutrition, but it is difficult to imagine capillary walls suffering from lack of nourishment even with the poorest of blood, and it seems more probable that the hemorrhages are due even in cachexia to chemical constituents of the blood that injure the endothelium.

As to changes of blood pressure, it will be remembered that so large is the capillary area as compared with that of the arterial system, and so great the friction of their walls as the blood stream passes through them, that even when the initial pressure is high it is reduced to the practically negligible force of between 20 and 30 mm. of mercury by the time that it reaches these terminals. Balanced, moreover, as it is by the ocular tension, a pressure rupture in a normal capillary must be impossible, as we do not have retinal hemorrhage with the high tension of glaucoma or in the greatly reduced tension of phthisis bulbi.

An added importance to the subject lies in our understanding not alone of hemorrhages within the eye but also of hemorrhages elsewhere in the body. It would seem very doubtful indeed if in cerebral apoplexy the vessel breaks because of the internal pressure from the blood; more likely, the protein poison, from whatever source it originates, has so affected the nutrition of the endothelium at that special point in the vessel's course that the normal elastic cellular substance, then replaced with calcareous or other mineral substances, is so softened that dissolution of the walls results and hemorrhage is precipitated. If, as would seem, this is what actually occurs, the recognition of this newer pathology will enable us to seek the origin of the focal nidus producing the poison, and by removing this stop the recurrence of this tragic disaster instead of wasting valuable time in eliminatives that can have no direct effect whatsover on the disease.

ABNORMAL REFLEXES CAUSED BY MORPHIN POISONING IN A TABETIC

MICHAEL OSNATO, M.D.
NEW YORK

The patient is a physician, aged 48, married. He is bedridden and undoubtedly has a well advanced case of tabes, in the paralytic stage. The diagnosis has been confirmed by serologic and spinal fluid examinations, both of which have been performed under the supervision of Major Joseph Collins at the Neurological Institute.

Mentally, the patient shows a pure acute depression. For a number of weeks prior to the taking of the overdose of morphin, he had been talking of committing suicide, lamenting his fate and the hopelessness of his condition. He cried a great deal, and was irritable and complaining. For several days before taking the morphin he had suffered from moderately severe laryngeal and cardiac crises, and also from root pains in both lower extremities. His memory was good and there was no mental deterioration. There was no expansiveness, no excitement other than the agitated depression, and there were no indications at any time of euphoric tendencies. Mentally and neurologically, there was nothing to suggest that the patient was a paretic.

As revealed by the general neurologic examination before the taking of morphin, all the cranial nerves were functionating properly. The fundi were normal. The pupils reacted very little to light, and were small and slightly irregular, but reacted well to accommodation. There was good consensual reaction. The patient was unable to stand except by the aid of a cane or by leaning on the arm of another, and could not walk without help. There was a decided equilibratory and nonequilibratory ataxia. The deep reflexes in the upper extremity were fairly active and equal, but the ankle and patellar reflexes had been absent. There had not been any Babinski reflex, and whatever response the great toe gave to stroking of the plantar surfaces had been very mildly flexor. There was no clonus. There was loss of power in the lower extremities and loss of tone. There was no atrophy and no tremor. There were several areas of anesthesia; and various paresthesias and dysenthesias had been found in both feet, particularly on the plantar surfaces. The speech showed no defect excepting that when the patient spoke moderately long, the voice became weak and thin with much complaint of dryness of the throat. The normal blood pressure ranged between 120 and 130 with no diastolic record, except on one occasion taken about two weeks before the incident under discussion, when it had been 120 systolic and 80 diastolic. The heart and lungs were normal, and the peripheral and retinal blood vessels had been singularly free from arteriosclerotic changes. There was incontinence of feces and urine, which was of about eight months' duration.

About 5 p. m., March 23, 1918, the patient took surreptitiously eight ¼ grain tablets of morphin. In about an hour he was unconscious, cyanotic, dyspneic and apparently dangerously ill. The physician found him breathing stertorously and irregularly, with face, lips and hands cold and blue. The heart rate went from 140 to 176 within a half hour, but did not become intermittent until the more rapid rate had been reached. Later, the breathing was characteristic of the Cheyne-Stokes type. The pulse was small and weak, and the physician judged that the blood pressure was extremely low, although it was not taken. The patient was in coma and could not be aroused. He was immediately stimulated and the general condition improved somewhat, although the coma continued as profound as before. The attending physician watched the case and studied the clinical symptoms with no idea whatever that morphin had been taken and was really the cause of the symptoms. There is no record of the reflexes during this period.

I examined the patient at his home about 8 o'clock that evening. He was breathing quietly but regularly. Occasionally there was a pause of from four to ten seconds without respiration, and the average rate was from eight to ten per minute. He was neither livid nor pale. The head was turned to the left and remained continuously in that position. If the head was placed straight, within a few minutes it would resume the position described above, although it did not seem to be pulled in that direction. The patient was in a condition of extreme muscular relaxation. There was a marked muscular flaccidity in the trunk, in all four extremities and in the neck, which could not be entirely accounted for by tabes.

All the cranial nerves appeared to be functionating properly. There was no demonstrable central or peripheral type of facial palsy, although it appeared to two of us that possibly the left side of the face was flatter than the right. However, as I had not seen the patient for a long time, I did not pay much attention to this symptom. The pupils measured about 2.5 mm., and reacted poorly to light; accommodation could not be tested, the patient being in coma. The consensual reaction was absent on repeated testing. The reflexes in the upper extremity were fairly active and equal. The patellar, ankle and dorsocuboidal reflexes were absent. The abdominal reflexes were peculiarly inconstant. At the first examination of the evening, it was almost impossible to get more than a very slight flicker from the abdominals on the left side; later, these became very active; the reflexes on the right side could not be obtained. Still later, all the superficial reflexes except the lower right abdominals were active. Most surprising was the definite presence of a well marked Babinski response on the right side which was demonstrated time and again, and which was produced at each stimulation at least eight or nine times. On the left side we obtained a doubtful Babinski response on three or four occasions. The Oppenheim reflex on the left side was surely present; on the right side, this abnormal reflex, together with a Chaddock and Shaffer reflex, was present. No Gordon reflex could be elicited on either side. There was also present at each application of the test a Klippel-Weil reflex on the right side only. Here, too, there was present the pronation sign of Strümpell. The sign of Marie-Foix was absent. The patient's muscles were extremely flaccid. There were twitchings and convulsive movements of the legs and right upper extremity. The rest of the neurologic examination was negative. The heart beat was 136 and regular. There was brachycardia. The blood pressure was 80 systolic, and the diastolic pressure could not be obtained. A few hours later, the blood pressure had fallen to 75 systolic. The face was not suffused or cyanotic, and the breathing was not stertorous. The skin was warm and dry, the temperature 97.

At the consultation that followed, several conditions were thought of. We did not dream of any toxicosis from morphin, and after considerable discussion, it was agreed that we had to deal with a cerebral hemorrhage. We felt that the patient was at the point of death, and I called attention to the fact that blood pressures were prone to take a sudden drop before death in cases of cerebral hemorrhage. The abnormal reflexes decided the diagnosis, particularly as I reasoned that the pyramidal tract irritation must be great in order to produce clinical evidence of such a pathologic condition in an advanced tabetic. I was mystified by the presence of the Babinski and Klippel-Weil reflexes, particularly in view of the hypotonia and the absence of deep tendon reflexes in the lower extremities.

The subsequent history of the case was very gratifying. Despite the fact that it was considered unwise to use stimulants of any kind and that nothing at all was done for the patient except to leave him alone, in five or six hours he began to regain consciousness, and in twenty-four hours had entirely recovered from his coma.

At an examination made two days later, all the superficial and deep reflexes were as they had been before the ingestion of the morphin, and the abnormal reflexes mentioned had disappeared. The consensual reaction had also returned. We were informed by the patient at this examination of the deliberate attempt to take his life.

COMMENT

An investigation of the effect of morphin on the nervous system reveals that most authorities agree that the spinal reflexes are increased by morphin, both by moderate and toxic doses. The same authorities also agree that cerebral inhibitions of various types are increased by the depressant action of morphin on the brain. It has occurred to me that a combination of these two physiologic actions of morphin may be offered as an explanation for the phenomena observed in this patient.

Hare[1] says:

> The action of opium upon man and the lower animals varies with the degree of intelligence or cerebral development. It quiets the brain and excites the spinal cord.

Sollmann[2] agrees that:

> The reflexes and the spinal functions are mainly stimulated.

Wood[3] says:

> There is considerable physiological evidence that in frogs, at least, presumably in other animals, there is located in the optic lobes a center known as Selschenow's center, whose function is to control reflex activity, and stimulation of which diminishes reflexes. It would appear plausible that morphin in small doses excites this center so that the spinal activities would be lessened and that the large dose stimulates the ganglia in the gray matter of the spinal cord, perhaps also paralyzing the inhibitory center at the same time, thus producing marked increase of reflexes and even convulsions.

Some such physiologic action as has just been described must be called in to help us explain the phenomena observed in the patient. There must of necessity be posited the presence of a physiologic action characterized by removal of cerebral inhibition over the control of reflexes. The effect of such removal of cerebral inhibition would be to allow the drug a free hand in exciting the inherent reflexes existing in the spinal cord. Such a combined action would give us an explanation for the phenomena observed here.

It will be recalled that the Babinski phenomenon and allied abnormal reflexes, including the Klippel-Weil (in the hand), have been explained on the ground of loss or diminution of the control exerted by the corticospinal or pyramidal tracts on reflex movements. The pyramidal functions are inhibitory of voluntary and reflex movements. Phylogenetically, the pyramidal tracts are of late acquisition, and their removal, therefore, or diminution of their function for any reason would allow an older mechanism to work unhampered. Such a mechanism is found in the spinal cord reflexes which, it seems agreed, morphin excites.

CONCLUSION

A report of this case is possibly of importance in throwing some light on the physiologic action of morphin on the brain and spinal cord, particularly as it relates to the reflexes. The conception of morphin as a cerebral depressant and spinal stimulant seems to be borne out in some degree by this case.

SIMPLE METHODS FOR PROLONGING THE VIABILITY OF MENINGOCOCCUS CULTURES *

DOLORES E. BRADLEY, M.A.
Berkeley, Calif.

The old problem of maintaining stock cultures of meningococci presented itself in our laboratory during the past year. An unusual demand for reliable control cultures has developed in connection with the detection of meningitic carriers in Army cantonments and naval training stations. The maintenance of a large number of cultures for preparing highly polyvalent antimeningitis serum has been a perennial problem of the manufacturer. The transportation of meningitis cultures presents especial difficulties. Cultures brought to this coast from New York on several occasions were sent by special messenger and, while they were on the way, fresh subplants were made at Denver, yet only a small proportion arrived safely. Another case of interest was observed in Dr. Wollstein's[1] work on parameningococci. A hurried journey was made to Paris by Dr. Louise Pearce to secure two cultures from Dr. Dopter, "since it was found that the cultures sent by post did not survive the journey."

The uncertainty of maintaining cultures on blood agar, starch agar, and sheep serum glucose agar slants led to an attempt to find a simple, stable medium in which the organisms might be kept alive with less difficulty. This has been accomplished by the use of various deep mediums, especially beef brain.

Many mediums have been devised for the cultivation of meningococci, on which they may remain alive a short while, or survive through several generations, and then suddenly die out, even with frequent transplanting. The question of viability presents a separate problem from that of artificial cultivation. With this in mind, Vedder's[2] suggestion as to the use of starch agar was taken up, but this necessitated frequent transplanting. Although gonococci and meningococci possess many similarities, this medium, which is suitable for the former, was not highly successful for meningococci. A modification was adopted, namely, the addition of 5 per cent. defibrinated rabbit blood, and in place of slant cultures, stab cultures, 6 cm. in depth, were made with some success. Roos[3] has devised a potato extract blood agar which in our work has maintained the cultures quite satisfactorily. Eastwood,[4] Griffith[5] and Scott[6] made cultures of isolated colonies of meningococci on solidified egg. As no formula was given, simple egg slants, solidified in the Arnold sterilizer, have been used in experimental work. One feature of this medium mentioned by Griffith is the viability of cultures for many weeks, and growth after seven months in the incubator at 22 C. This work has not been repeated in detail in these experiments, but the undoubted value of egg medium protected from evaporation has been determined at 37 C.

I was led to test the viability of meningococci in sterile brain by the apparent affinity of these organisms for nervous tissue. While the experiments were in progress, a suggestion was made by Dr. F. P. Gay as to the value of chopped beef or liver prepared and sterilized in the same manner as brain medium. Some work has already been done with these two substances, and results show that the fundamental principle necessary for growth and viability is not contained alone in brain. The observations of Wherry and Oliver[7] on the adaptation to reduced oxygen tensions shown by gonococci and other bacteria, followed by the work of Cohen and Markle[8] on meningococci in partial tension cultures, lead us to conclude that the depth of these mediums has an important bearing on the viability of cultures both at 37 C. and at room temperature. It may well be also that the matter of moisture retention is equally important.

* Rockefeller number. † University of California number.

In the experiments under consideration, five cultures, obtained by the Cutter Biological Laboratory of Berkeley from the Rockefeller Institute, were used. All are characteristic gram-negative diplococci, fermenting glucose and maltose in Dunham's peptone solution containing 5 per cent. rabbit serum. A polyvalent serum procured from Dr. J. G. Fitzgerald of Toronto agglutinated all the cultures in one hour at 37 C. in 1 c.c. of a dilution of serum of 1:10, with 1 c.c. of a suspension of organisms in phenolated saline. At the end of twenty-four hours at 8 C., all were agglutinated in a serum dilution of 1:100, with 1 c. c. of the organisms in suspension. The controls, containing 2 c.c. of phenolated saline with the organisms in suspension, remained unagglutinated.

Certain preliminary experiments were made to determine the viability of the meningococcus in brain and blood mediums, the results of which are shown in A and B of Table 1. The success of these led to comparative studies of deep brain, blood, and other recommended mediums, as shown in C of Table 1.

It is of interest to note in connection with the use of blood that Davis[9] made some special tests with defibrinated blood from normal persons and meningitic patients to determine its bactericidal effect. He found that the organisms lived in some normal bloods and not in others. He noted also that cerebrospinal fluid acted much like serum. Results of the tests with normal blood serum indicated that the organisms were dead from one to two hours after their preparation.

The deep brain medium, according to von Hibler,[10] is thus prepared: Beef brain is chopped fine, and one-third the volume of distilled water is added. The mixture is tubed in lots of from 12 to 15 c.c. and sterilized, preferably in the Arnold sterilizer, three successive days. Before we plant into this medium, it is customary in our work to transfer a loop of brain to agar medium and incubate twenty-four hours to detect any contamination.

In addition to deep brain, a deep blood medium was also used. Blood is obtained aseptically from rabbits by heart puncture, defibrinated and tubed in lots of from 12 to 15 c.c. The latter medium has been used by Miss Winegarden of the Cutter Laboratory, with considerable success, in keeping cultures over a long period. Deep blood is equally valuable, according to Miss Winegarden, for the preservation of pneumococcus and gonococcus cultures.

In the preliminary tests, the inoculated brain and blood mediums were placed in the incubator at 37 C., and subcultures were made at the end of twenty-four hours on agar slants containing 0.5 c.c. of defibrinated rabbit's blood. Following incubation of the slants,

[10] Von Hibler: Untersuchungen über pathogene Anaeroben, 1908, p. 85.

Gram's stains were made to confirm the purity of the cultures. At intervals the tests were repeated until the brain and blood (unfortunately in the preliminary test about 2 cm. in depth) were comparatively dried out. Feb. 1, 1918, broth warmed to 37 C. was added aseptically to the fast-drying mediums. The brain was restored to its original bulk. The blood, however, did not lend itself readily to suspension in the liquid. At this time rubber test-tube caps were placed on the tubes. Where pure subplants still develop, characteristic gram-negative diplococci are present. In all subsequent tests for growth and purity from other mediums, the same technic has been followed, except that precautions to avoid evaporation have obviated the necessity of restoring lost moisture.

Paraffin plugs were employed, but these are unsatisfactory. With constant use, the plugs became smooth and may slip down into the culture. They are also inconvenient to handle. Rubber stoppers were tried, but the opportunity for contamination was increased; both types, therefore, were discarded in favor of rubber test-tube caps, which are proving highly satisfactory. They last reasonably long, on exposure in the incubator; and, in comparison with paraffin, prevent evaporation very effectively.

It is of interest to note that successful subplants were made from relatively dry blood and brain mediums; but the results were rather irregular.

To obtain cultures for serologic work, it is preferable to subplant from the brain medium on to blood agar slants, incubate twenty-four hours, and subplant from these slants to fresh blood agar to secure suspensions of organisms free from brain.

So far, the brain and blood mediums compare favorably; but the ease of preparation rests with the former. When a large number of organisms are kept in stock, the taking of blood in quantities becomes a problem.

At the present time, cultures are being kept on several mediums, as shown in C of Table 1. From time to time, tests are being carried on to determine the viability and purity of the cultures kept at 37 C., and covered with rubber test-tube caps. The work has not as yet been concluded, but serves to point out the value of mediums recommended. In order to verify the original test on brain, we have prepared several sets of the organisms at various dates, the results of which are recorded in Table 1.

In the transportation of meningococcus cultures, it is highly desirable that viability be maintained at ordinary temperatures. Notwithstanding the remarkable resistance of the closely related gonococcus to low temperatures, as recorded by Lumière and Chevrotier,[11] it has been generally agreed and specifically proved by Flexner,[12] Elser and Huntoon,[13] and others that viability of meningococci at temperatures lower than 37 C. is very limited. Flexner's[14] more recent article emphasizes the same point of view.

That deep brain cultures remain alive for many days at lower temperatures, as shown in Table 2, is therefore highly important. There can be no doubt, however, from the tests, so far as they have gone, that even in deep brain cultures the meningococcus is of longer life at 37 C. than at room or at icebox temperature.

EPIDEMIC OF GERMAN MEASLES IN A CITY ADJACENT TO AN ARMY CANTONMENT

AND ITS PROBABLE RELATION THERETO

J. C. GEIGER, M.D.
Assistant Epidemiologist, United States Public Health Service
LONOKE, ARK.

Much comment has been heard on the prevalence of measles in Army cantonments. German measles as a factor in disease incidence in troops has been more or less overlooked, with probably serious results. It is common knowledge that in the moving of troops, in the present selective draft and in the concentration of the National Guard for reasssembling to proper training stations and to complete permanent organizations, certain epidemiologic features of diseases prevalent among them have been overlooked along with the prescribed methods of interstate quarantine. As a result, diseases like measles and German measles have occurred in Army cantonments and have in many instances produced an increase and even caused epidemics of these diseases in adjacent cities. The absolute necessity for proper diagnosis and differentiation of the infectious diseases, particularly measles and German measles, if only for control, was evidently at first disregarded.

THE OUTBREAK

Beginning in October, 1917, local physicians reported a type of measles, later diagnosed as German measles, in North Little Rock, Ark., a city of 15,000 inhabitants, situated adjacent to Camp Pike, a large Army cantonment used for training drafted troops, and Fort Logan H. Roots, used at first as a concentration point for the mobilization of the Arkansas National Guard. Coincident with the increase of the disease in North Little Rock, measles was reported to be increasing at Camp Pike and Little Rock, a city of 75,000 inhabitants just across the Arkansas River. The presence of true measles in North Little Rock made differentiation comparatively simple, each case being investigated and followed to completion, and all available data compiled.

The interesting factors noted were:

1. The difference in the combined measles and German measles curves in separate communities, illustrating graphically the effect of differentiation and a simple method of control.
2. Recurrent attacks in cases of German measles in the same epidemic.
3. The occurrence of acute arthritis in many cases as a complication, and the absence of pneumonia.
4. The isolation of a hemolytic streptococcus from four cases of acute arthritis, and its possible relation to the streptococci in the true measles pneumonia.

EPIDEMIOLOGY

Attention is called to the combined measles and German measles curves in Camp Pike,[1] Little Rock and North Little Rock (Chart 1). It will be noted that though the height of the curve, which was reached in November in the epidemics in Little Rock and North Little Rock, were identical, the curve of Little Rock remained steady, while that of North Little Rock rapidly declined. This was undoubtedly due to differentiation and measures instituted for control, there being no determined attempt to do either in Little Rock. The height of the combined curves for Camp Pike were reached in December, and differentiation[2] began about this time. It is of unusual interest to note the separate curves of measles and German measles in North Little Rock (Chart 2). The similarity of the height curve shares in importance with the larger number of cases of German measles reported. Since the incidence of German measles was greater than measles in North Little Rock, then like conditions probably existed in Camp Pike and Little Rock, all things being practically equal. This offers an explanation for the height curve from Camp Pike not being reached until December, and the remarkably large incidence there, as patients with German measles could easily have been discharged while still in the incubation period of measles, with resulting cross-infection and new contacts and all their accumulative dangers. The contagiousness of German measles is said not to approximate measles. In schools in the classrooms of which fresh cases were known to have been from one to two days before being discovered, the resulting incidence in those exposed, each classroom being taken as a separate unit, averaged 12 per cent. The average incubation period in 173 cases was seventeen days, the shortest being eleven days and the longest twenty-one days. Recurrent attacks occurred in fifteen cases. In five, three separate distinct attacks occurred in a gradual lengthening period. For instance, in two cases, the second attack occurred three weeks after the first and was subsequently followed by a third attack, five weeks after the second. Only one of these persons was known to have been exposed to an active case before the third attack at a time not inconsistent with the known incubation period.

---

[1] The Camp Pike curve was taken from the base hospital daily report of measles patients admitted.

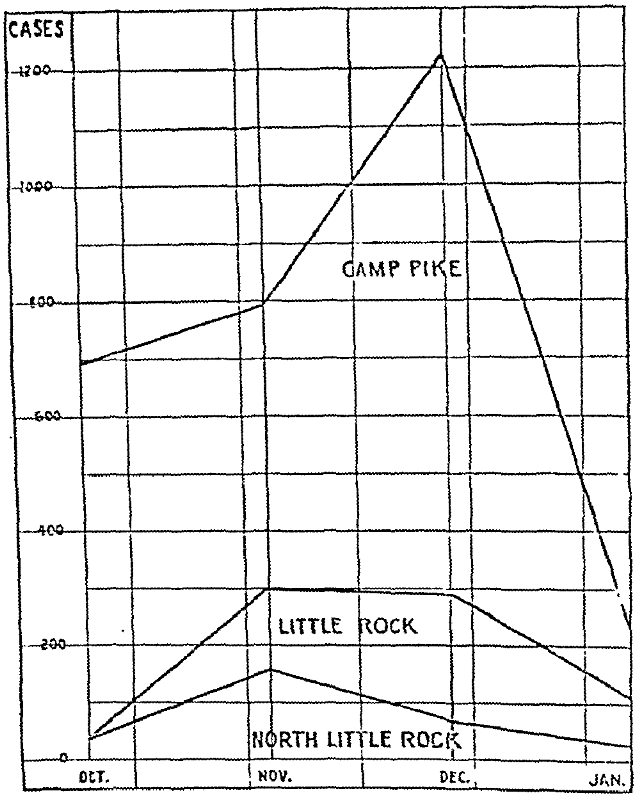

Chart 1.—Total combined cases of measles and German measles, Oct. 1, 1917, to Feb. 1, 1918.

SYMPTOMS AND COMPLICATIONS

In the majority of cases in this epidemic, no prodromal symptoms were noted, the eruption appearing without warning. The most constant symptom and one regarded as diagnostic was the enlargement of the superficial lymphatic glands. Koplik spots were never found. The eruption is rarely ever predominant, but there are always large confluent areas, best seen on the abdomen and the inner aspects of the limbs. The temperature may be above normal, but never higher than 101. German measles, heretofore regarded as the mildest contact disease, with complications infrequent, did not prove so in this outbreak. In thirty-six cases, acute arthritis occurred, recovery being most difficult. In four cases hemolytic streptococci in pure culture were isolated from much enlarged knee joints, one of which later presented a deformity fixation. In two cases, acute nephritis was noted, in one of which three months later there was still a transient albuminuria accompanied by an elevation of temperature. Endocarditis as a complication was noted in one case, and otitis media in eight cases. Pneumonia never followed any case in this series, and many patients could not be regarded as getting the best medical attention and nursing care.

CONTROL

The disease being regarded so lightly, no determined efforts of control were recorded. An attempt at control was made in this epidemic in one small school, situated in an average working class district, the entire control measures being based on the known average incubation period and medical inspection. Pupils of this school, reported ill, were excluded, and those diagnosed as having German measles were quarantined at home, but not isolated from the other members of the family. In ten families averaging three school members to the family, cases of German measles occurred. The other school members of these families not infected but being daily exposed to the cases in the homes were allowed to attend school up to the fourteenth day, when they were promptly eliminated for one week. No new cases occurred that

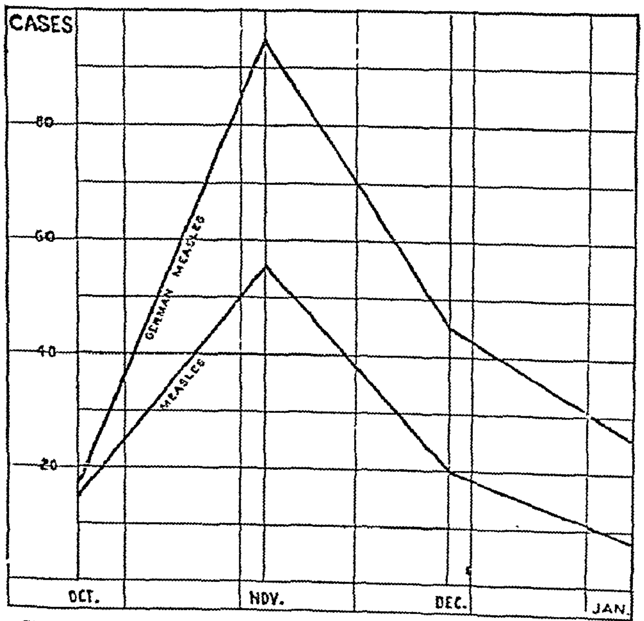

Chart 2.—Total cases of measles and German measles in North Little Rock, Oct. 1, 1917, to Feb. 1, 1918.

---

2. By personal communication.

were traceable to the original cases excluded from school accordingly, and absentees were reduced to a minimum.

It is interesting to note here that the contagiousness of the disease in the foregoing families averaged 65 per cent. in contradistinction to that in the classroom, 12 per cent. No person should be released from quarantine without being clear of complications, and particularly until all glandular enlargement, the most consistent symptom, has disappeared.

Clinical Notes, Suggestions, and New Instruments

AIDS IN THE USE OF DAKIN-CARREL TREATMENT

Max Bornstein, M.D. (Milwaukee), Camp Grant, Rockford, Ill.
First Lieutenant, M. R. C., U. S. Army

A GLASS AUTOMATIC SIPHON, FOR DELIVERING A DEFINITE AMOUNT OF FLUID TO THE WOUND AT A DEFINITE PERIOD OF TIME

This apparatus[1] is blown entirely of glass and fused into one compact piece. It is clean, handy and dependable. It can be made in different sizes, depending on the quantity of flushing required. The periodicity of flushing is regulated by a Hoffman pinch-cock on the tubing between the solution tank and the apparatus.

Two bells (*A* and *B*) annealed one to the other are connected by a siphon tube (*C*). A drip point is annealed into the upper end of the upper chamber. Both chambers have air vents.

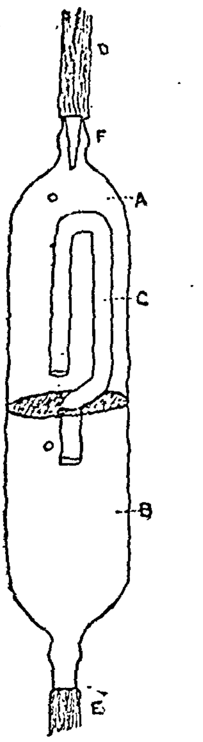

Fig. 1.—Glass automatic siphon, for delivering a definite amount of fluid to the wound at a definite period of time: *A* and *B*, upper and lower chambers; *C*, siphon tube; *D*, tube leadi[illegible] to solution tank; *E*, tube leading to Carrel tube; *F*, drip point.

The apparatus works as follows: Solution from an irrigating bottle or bag is allowed to pass a pinch-cock at a fixed rate. It accumulates in the upper chamber *until it reaches the highest point* of the siphon, when it suddenly is emptied by the siphon into the lower chamber. Here, by virtue of its height and its weight, it forces its way through the holes in the Carrel tube and flushes the wound. The flushing is periodic and eliminates the inconstant human element which is so often the cause of failure in the Dakin-Carrel technic.

A SUCTION DRAINAGE BELL FOR APPLYING DAKIN-CARREL TREATMENT IN EMPYEMA

This apparatus can also be applied, without the suction, in sterilization and drainage of the urinary bladder.

It consists of a flattened bell of glass, resting on a wide flange (*A*), where it comes in contact with the skin around the wound opening. At the upper end of one diameter are two small tubular openings (*B*) for transmitting the usual Carrel tube into the wound cavity. One of these may be used for *flushing the bell* and *for cleansing*. On the opposite side is a large tubular opening (*C*) for carrying off drainage, by means of a rubber tube *into* a waxed or rubber bag. Also, *to this* latter opening may be applied vacuum *suction in* empyema cavities by connecting with a vacuum water suction pump. The apparatus is held in position by a rubber dam fitted on the flange and by adhesive. By its use one can save large quantities of dressings, [illegible]em. It prevents secondary contamination of the wound, and permits instillation of neutral solution of chlorinated soda. It allows for drainage which seeps out beside the Carrel tube; and in the urinary bladder, it does away with that constant overflow of foul smelling urine. In empyema it permits the use of negative pressure to expand the lung and hastens obliterations of the empyema cavity. A Furniss rubber empyema spool is a valuable aid. It is made of glass; can be removed easily for cleansing and boiling, and can be as easily reapplied.

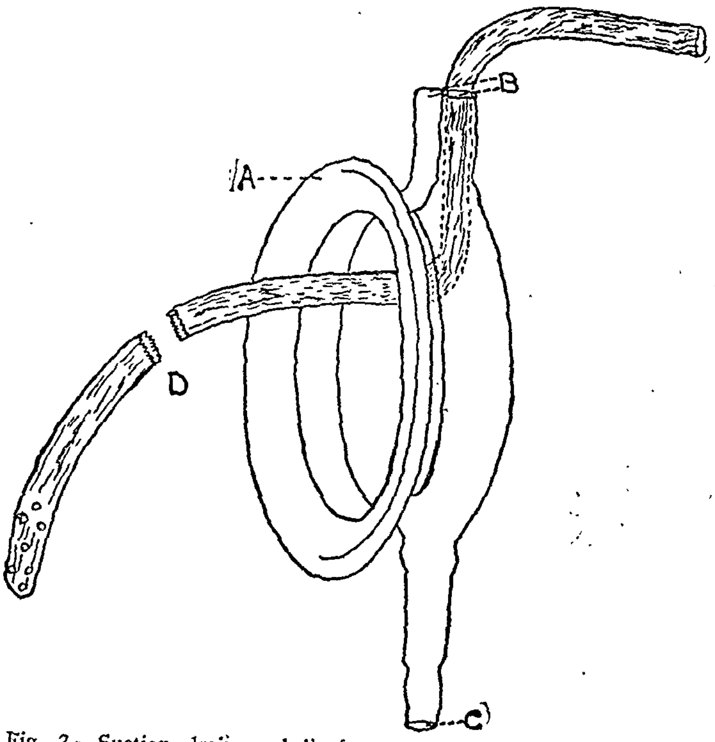

Fig. 2.—Suction drainage bell, for applying Dakin-Carrel treatment in empyema: *A*, flange on which bell rests; *B*, tubular openings for transmitting the usual Carrel tube into the wound cavity; *C*, large tubular opening for carrying off drainage; *D*, Carrel tube.

---

[1] An apparatus [illegible] was described by Lilienthal [illegible] Surgeon.

SUCTION DRAINAGE OF SUPRAPUBIC BLADDER WOUNDS: DESCRIPTION OF A NEW PUMP

Charles W. Bethune, M.D., Buffalo

One of the most unpleasant features of suprapubic bladder drainage is the constant saturation of the dressings with urine, together with the all-pervading odor, not to mention the present high cost of dressings. The patient's skin becomes excoriated, and he also suffers the discomfort of frequently lying in a puddle if the attendants do not promptly change the saturated pads.

Numerous attempts have been made to remedy this with various ingenious suction devices, the first of which I believe was Dawbarn's. Davis[1] uses a vacuum bottle arrangement; Hume, Logan and Kells[2] an electric pump with an alarm clock switch; Wallace[3] an apparatus invented by Edmund White, resembling the Dawbarn. All of these appliances have faults which I have tried to obviate. Dawbarn's and White's require the bringing of several gallons of water to the pump daily and the removal of an equal amount. Davis' *requires an air pump to* produce the vacuum, and a very tiny perforation in the rubber tubing puts the pump out of commission. The pump of Hume, Logan and Kells is dependent on the electric current and costs four times as much as mine. So far as I know, Dawbarn's has been abandoned.

As the diagram shows, my apparatus consists of 2 *gallon* carboys held necks opposite with the long axis in the same line by a frame pivoted at the middle to a stand. The *top* bottle, *A*, *is filled with* water to which 1 *teaspoonful of*

3. Wallace, Cuthbert: Prostatic Enlargement, p. 15C.

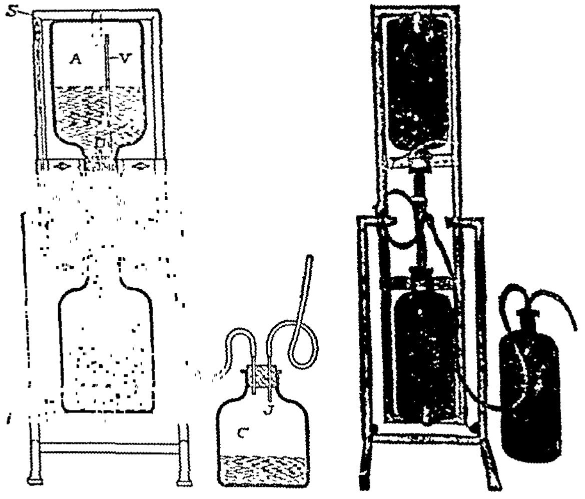
phenol (carbolic acid) is added to prevent the formation of fungi. The water drips through Tube D, on which is a drip clamp, into Bottle B, at the rate of 5 drops per second. A negative pressure is formed in the top of *A* which is transmitted down Tube V to the collecting bottle, *C*, the water in the bottom of *B* forming a valve and preventing the vacuum from being lost. Tube E forms an outlet for the air in *B* displaced by water dripping into it. A similar tube, *S*, forms a safety valve for *A*, and when the negative pressure in *A* and C exceeds 14 inches of water or about 1 inch of mercury, admits air into *A*, preventing too strong a vacuum.

When the top bottle is empty, which takes about eight hours, the bottles are reversed by turning them on the axle, when *S* assumes the function of *E*, and vice versa. The bottles lose a small amount of water from evaporation through *S* and *E*, and require replenishing about every eight weeks. To do this or to fill them in the beginning, a funnel is attached to Tube S by a rubber tube and the liquid poured in from a pitcher; or after the tube is full, the distal end is placed in a pail placed above the pump, and allowed to act as a siphon.

All parts of this pump except the frame are made from articles obtainable in any city or hospital, and in case of breakage can be replaced anywhere. Owing to unfortunate experiences in having two instruments of my invention appropriated by others as their own invention, I have applied for a patent for this pump.

My pump is self-contained and needs no accessories to operate it, is independent of all running water, air pump or electricity, and all the attention it needs is reversal of the bottles every eight hours.

The pump should be placed between the head of the bed and the wall. The tube from the Y on *V* to *C* should be about 6 feet long, and at some point elevated above the level of Bottle A. This is best done by a loop of string attaching it to the top of the bed. The tube then runs down to *C*, placed on the floor under the bed beneath the patient's pelvis. A small catheter is inserted in the suprapubic wound and fastened to the skin by several strips of adhesive plaster. This is attached to a tube running down hill to *J* so that the only suction necessary is to draw the urine from the bladder up over the level of the abdomen.



Apparatus for suction drainage of suprapubic bladder wounds.

Voluminous dressings are to be avoided, as they prevent air from entering the bladder to replace the urine sucked out. Two or three layers of gauze are sufficient. If a heavy pad is used, the bladder is apt to become distended with urine. Then it will well up through the wound alongside the tube before suction starts.

When granulations hug the catheter tightly it should be removed. The wound usually will close in a few hours if the wide strip of adhesive plaster is put over it tightly, pressing the lips together.

In the majority of cases the wound has closed in two weeks. Some have taken three, one four and one six weeks. Two very debilitated patients died in the eighth week with the wound still draining.

Causes of Failure to Secure Satisfactory Suction.—If the safety valve continually blows, the catheter may be stopped up; the drippings at *D* may be too fast; the suction tube may be kinked, or the suction tube may collapse through being made of too soft rubber. If the pump is working but no urine drops into *C*, the suction tube leaks; one may determine the point of the leak by beginning at the catheter and pinching the tube at intervals; when the safety valve blows, the leak must be distal to this point; or the catheter may have slipped out of the wound, or the cork of *C* may be loose.

When the pump is operating, the water in the safety valve is continually jumping up and down, and drops of urine are falling into *C* every few seconds. Care must be taken that Tube J projects into *C* lower than the other tube, or urine is apt to be caught up and pulled into the pump. If water is pulled from the pump into *C*, the long tube from *V* should be elevated more where it passes the head of the bed.

This pump has been in use for two years at the Sisters of Charity Hospital as well as by several urologists and general surgeons, and has been found uniformly satisfactory.

By clamping the safety valve and opening *D* fully, the apparatus is very satisfactory in nose and throat operations or wherever suction is used in operating. It has also been used with success by Dr. E. J. Meyer in draining empyemas. The pump is manufactured for me by Sands and Levy of Buffalo, N. Y.

520 Franklin Street.

Military Medicine and Surgery

THE ARMY IN RELATION TO THE TUBERCULOSIS PROBLEM *

GEORGE E. BUSHNELL, M.D.
Colonel, U. S. Army, Retired
WASHINGTON, D. C.

In the early part of the year 1917, just after this country plunged into the great war, there was much anxiety expressed as to tuberculosis among our soldiers. The view held seemed to be for the most part that the health of the soldier undergoes deterioration as the result of his military service such that he who enters with an inactive or concealed tuberculosis might be expected to develop an active and serious form of the disease. Many papers were written which took this alarmist view and recommended that the extremest care be expended in examinations with a view to the elimination from the army of all those who exhibited the slightest signs even of old and completely healed tuberculosis. The assumption here evidently was that all soldiers had been submitted to an examination adequate to detect all active forms of the disease, so that tuberculosis, if found to exist at a later time, must have developed as a result of army service. Unfortunately, however, those conversant with the facts were willing, however reluctantly, to admit that this was not necessarily the case; that, given the hurry and confusion of hasty enlistments and the varying skill of the examiners, it was quite possible that some men, even many men with tuberculous disease, might be admitted as sound into the ranks of the army. The existence of tuberculosis in the army is, therefore, by no means necessarily evidence that army life in itself favors the development of the disease.

---

* Jerome Cochran Lecture, read before the Annual Meeting of the Alabama State Medical Association, April 17, 1918.

We have, then, two views to consider: First, army life per se exercises an unfavorable effect on healed tuberculous lesions and awakens active tuberculosis very easily so that the tuberculosis of the soldier develops as an active disease after entrance into the army in the persons of those who were practically well at the time of such entrance. Second, that the tuberculous soldier brought his tuberculosis in an active stage with him into the army. He should have been excluded on the entrance examination but was not; the active disease was there from the outset, and the progressive nature of the affection which finally led to its detection was only what might have been expected when a sick man was subjected to fatigue and exposure.

Which of these two views is the correct one? The answer must be that neither one is absolutely correct. Some men will develop tuberculosis though apparently free of the disease when examined for admission. The first view has, therefore, something in its favor. But the percentage of such cases, what is called the unavoidable percentage, is very small. Measures adopted to forestall such developments are useless, because the cases cannot be detected in advance, and, moreover, harmful because tending to the exclusion of many men perfectly fit to become soldiers. Practically we may say that if an army develops much tuberculosis this is due to the fact that the men brought with them the disease in an active form when they came in from civil life. The remedy, then, is evidently an examination which shall be efficient enough to exclude manifest cases of tuberculosis but which shall not regard the old and circumscribed evidences of slight impairment of the pulmonary integrity. It was an examination of this kind which was instituted and carried out on our troops during the fall and winter of 1917, the examinations, however, not being completed until the spring of 1918. In round numbers, 930,000 men were examined, and 7,500 cases of tuberculosis were detected as the result of this examination. It is not claimed that the examination was perfect. Some cases, no doubt, were overlooked that should have been detected, and some were excluded from the army who were perfectly able to serve. Mistakes must occur when large numbers of examiners go hastily over enormous numbers of soldiers. But the aim was to get rid of as many cases of manifest tuberculosis as could be detected in an examination so rapidly performed as not to interfere too much with the all-important training of the troops rather than to delay matters by seeking a perfection unattainable under the difficult conditions. That 7,500 cases of tuberculosis were removed is a cause for satisfaction. However many cases may ultimately develop, it is at least certain that the total is less by 7,500 cases than it would have been if there had been no reexamination.

THE ARMY AS A FIELD OF STUDY

The army is a good field for the study of some problems. The conditions of life are comparatively simple and the large numbers concerned give a value to the statistics greater than those derived from the much smaller number of cases available, as a rule, for study in civil life. Unexpected light has been thrown on the questions which we have just considered by the experience of the French army. As you may recall, the distinguished French physician, Landouzy, announced that 86,000 French soldiers had been invalided on account of tuberculosis in the first year of the war. This announcement was received with dismay in this country. It served as a text for the pessimist, and seemed to warrant gloomy forebodings as to the fate of our own soldiers. But new light has recently been thrown on this subject. The French minister of war reported that of this 86,000 men, considerably less than one-half have been found on revision to have tuberculosis. And there are not wanting those who claim that of this fraction a very considerable percentage has really no active disease, so that of the 86,000 barely 20 per cent. are really tuberculous. And here is an important fact. Landouzy himself states that, as a rule, those who were found to have an active tuberculosis had brought the disease with them into the army. We have thus an unexpected corroboration on a large scale of the view expressed above. Army life is not especially favorable for the development of tuberculosis. Those soldiers who enter as sound men have every reason to expect that they will not develop tuberculosis as a result of their army experiences.

Another fact brought out by the war is worthy of note in this connection. We are accustomed to hear the view expressed without contradiction that chronic semistarvation necessarily develops tuberculosis in a large number of its victims. Consequently we were all prepared to expect an enormous incidence of tuberculosis among the half-starved French prisoners of war in Germany. The Swiss doctors predicted that 30 per cent. would become tuberculous. But experience shows that while in some groups the percentage of tuberculosis has been considerable, in others the percentage in those returned is extremely small. According to recent advices, among 175,000 repatriated French civilians who had been held as prisoners, the percentage of the tuberculous was only 0.6. This remarkable showing seems to prove that even under the most unfavorable conditions a life in the open air prevents tuberculosis from exercising a dangerous sway.

We have reached the conclusion that a serious incidence of tuberculosis in the army would mean that tuberculous men had been admitted to it. The fact would discredit the professional expertness of the army surgeon rather than the hygiene and health conditions of the army service. An important lesson may be drawn from this fact which may serve to quiet some anxieties.

CONTAGIOUSNESS OF TUBERCULOSIS

You have been told that tuberculosis will develop under the conditions of army life and that there is danger of the disease being communicated from the sick to the well; that each tuberculous man is a potential source of infection to those around him; that consequently he should be isolated at once and eliminated from the hospitals of the mobile army at the earliest possible moment. I have sometimes thought that the ease with which the program of examination for the enormous masses of men of the army was put through—appalling task as it seemed at first sight—was to be explained by the prevalence of the notion that we must be rid of the consumptive, not so much because he is a weak link in the chain, not because he occupies a place that should be filled by a fighting man, but because he will spread disease among the well. There is some advantage, then, in this idea if it has enabled the useful work of reexamination for tuberculosis to be carried out. But though this advantage has been reaped, it is certainly well to revise our notions as to the contagiousness of tuberculosis. Everybody knows that doctors and nurses labor for years in closest contact with the consumptive, yet it is rare for them to develop tuberculosis in their own persons, and we have all seen many a delicate wife or mother tend a dying husband or son without contracting the disease. We have to admit that many are immune, however great their exposure. But on the other hand, there are cases in which both husband and wife have consumption, or in which those who occupy the same room or work at the same bench with a consumptive finally are found to be themselves infected. We do not stop to think that with a disease as common as tuberculosis it must frequently happen that cases of the disease will develop simultaneously without being derived one from the other, that a man who had or was going to have consumption might marry a wife doomed in advance to the same fate, or that if conditions of health, food, ventilation, etc., were bad enough to break down the health of one worker, they might be bad enough to have the same result with his neighbor. We do not stop to think of these possibilities, but instead we say that consumption is contagious, and the proof of the fact is that our neighbor died of consumption and his wife has caught it from him, the man who worked next to the consumptive in my factory has got the disease from him, etc. A great deal of perfectly preventable distress has been due to the alarmist's attitude toward the question of contagion of tuberculosis. The really cruel persecution of the consumptive, who is driven from his house and from his position through the fear that he will infect others, is based on what I must characterize as highly exaggerated notions of the danger of such infection. All admit that some are immune to infection; the question is, Are there others who are readily infected, and is this class a numerous one? The prevailing view is that the danger is so great as to justify the most stringent measures to abate it. A few with whom I must class myself believe that the danger is very small, so far as infection from adult to adult is concerned, and really demands preventive measures only in the case of young children.

I wish that time would permit me to set forth in detail the scientific reasons on which this opinion is based, but that is impossible. I must content myself with inviting your attention to the declaration of Landouzy. Years have elapsed since his 86,000 consumptives were weeded out of the French army. There has been time enough to judge of the end-results of their presence in the ranks, and on sober second thought the decision is reached that the consumptive brought the disease with him into the service. There appears no evidence that the disease developed frequently, at least after entrance into the army. Consequently we draw the conclusion that the disease could not have been communicated to any considerable extent, to say the least, from one soldier to another. Here is an experiment on a large scale; thousands of consumptives were put in closest contact with millions of healthy men, and the result after four years is that it cannot be shown that such proximity did the well men any harm.

RELATION OF MEASLES TO TUBERCULOSIS

We may, therefore, be reassured as to our army, so far as fear of spreading the contagion of tuberculosis is concerned. The soldier who enters the service in good health runs very little risk of acquiring tuberculosis from association with his fellows. There is, however, unfortunately a darker side to the picture which we in our zeal for the whole truth must not overlook, namely, the relation of measles to tuberculosis. Wherever large bodies of men are brought together, measles seems to break out. The disease is relatively insignificant when it seeks to attack the city dwellers. Most of them have already had measles and are immune. Not so among the country boys. Regiments made up of men from the farms have been severely tried. Many men have died of pneumonia following measles, and in some tuberculosis has developed as a sequel, showing the strange relationship that exists between the two diseases. In order to develop the facts and to lose no time in the treatment, orders have been given that all soldiers who have had measles shall be examined twice at intervals of a month to ascertain whether or not tuberculosis has developed. It has been found as a result of these examinations that of 5,945 measles patients reported as examined, 173, or 2.91 per cent., have developed an active tuberculosis. Here it is not a question of the transmission of tuberculosis from one to another, but of the reawakening of a latent tuberculosis as a result of the infection with measles. It should be added that it is probable that the number of really tuberculous cases is less than the foregoing figures would indicate, that some of these cases classed as tuberculous are rather cases of as yet unresolved pneumonias; but on the other hand, no doubt, not all cases of tuberculosis reactivated by measles have yet been detected. There again is an experiment on a large scale, which we will hope will prove in the end to have resulted more favorably than the facts now available would seem to indicate.

RECONSTRUCTION OF THE TUBERCULOUS SOLDIER

Tuberculosis having been found to be present in an active form in a given case, what shall be done with the soldier? The answer that many have given is to retain him in the service and "reconstruct him." Many brains have been actively engaged in plans for reconstruction hospitals and workshops and for apparatus to be used in the work. The term has been most employed by the surgeon. It includes the restoration to function or the teaching of new function of maimed extremities; the recovery of some degree of comeliness in faces with horrid deformities from wounds; exercise to keep or regain the activities of wounded nerves or muscles, which as soon as possible is obtained through some useful form of labor, and the teaching of new trades suited to the altered capacity of the worker, sometimes even the development of unsuspected abilities to do more excellent and better paid work than the man has ever done in his days of health.

The wounded man who has been reconstructed in the widest sense has been made over to some extent both physically and mentally, and consequently we may hope is morally aided as well. This is certainly a noble aim; yet, if we judge from the results in similar work abroad, one that we may reasonably hope to attain if our efforts are wisely guided.

As applied to tuberculosis, however, the problem of reconstruction, while it is similar, is yet really more difficult than it is in surgical cases. Here there is no question of repair to injuries: the tuberculous soldier has all his members intact. But whereas in surgical cases the effort is to set the patient at work at the earliest possible moment, in tuberculosis our aim must be at first to keep the patient still, to prevent him not only from working but even from moving about. And it may be necessary to continue him in this state of inertia for many months in some cases, if good and permanent results are to be attained. All the preconceived ideas of the patient, and in many cases the restlessness characteristic of the weakened nervous system of the consumptive, militate against the notion that prolonged rest in bed is needful or even desirable. To be successful in carrying out such treatment, it is necessary to instruct and to persuade. The physician must have faith in the treatment and a real interest in the patient's welfare if good results are to be attained. Not only does the physician study the patient, the patient studies the physician as well. In his daily visits the physician is weighed and judged. The patient soon knows whether the physician really believes what he says, whether he really cares to cure, or whether, on the other hand, his words of admonition and counsel are merely the perfunctory words of an official paid to perform a task in which he has no real interest. The physician must therefore have zeal in his work and a persuasiveness which succeeds because based on a true desire to help, and a belief in the efficacy of the means employed to cure. But more than that, he must be well grounded in the pathology of tuberculosis and be able to teach the patient from such a fulness of knowledge that it inspires faith in his teachings. The tuberculosis hospital or sanatorium should be a school for the education of the patient in the right way to live. But where a course of life extending over years is the thing taught, it is necessary that the patient shall know the reasons for the precepts given him. The *ipse dixit* of the physician may suffice for the moment. Its effect will fade in years to come. The facts on which the treatment of tuberculosis are based are not difficult of comprehension unless beclouded by a technical vocabulary which the patient cannot understand. Explain to him the reasons in a simple language, convince him of your interest in his welfare, and in many cases you will make a convert.

Some of the patients, however, will not be convinced, will not do well under treatment, and may seek an early discharge because restless and unhappy. A better result is not attained among those presumably more easily taught because more educated and of higher intelligence. Docility of the patient is one of the most important prerequisites of success in treatment, and a certain percentage will always be found indocile. In those who submit with good grace to the treatment, the danger exists on the other hand that the enforced idleness may become demoralizing, that having become accustomed to a life of repose the patient will shrink from the idea of resuming a life of labor; and when the time for work has come will demand his discharge in preference to undergoing a course of instruction, though that be calculated to fit him in the end for more and better work than he has ever before accomplished. The methods of instruction mentioned a moment ago are, in my judgment, the ideal methods. It can hardly be expected that the results attained by all physicians with the hundreds, if not thousands, of such patients will reach these ideals: and even the best instructed and most docile, when they pass from under the influence of their physician, will be tempted to stray from the course of life prescribed or become restless and desire a change of scene.

The old pension system was demoralizing to a certain type of men in that it enabled the pensioner to live without work. Fortunately, by the act that created the Bureau of War Risks, it is provided that those who serve in the present war will not be subject to the pension laws but will have a compensation in case of injury or disease which will be determined by the War Risk Board. Now if this compensation is arranged so that one who remains in the service will be better paid than one who receives discharge and returns to his home, it will be possible to retain the patients in the military service and under treatment. If this is not arranged, I believe that the majority of the patients will in the end seek discharge; and if they desire discharge, they must be given it. In this event the program of reconstruction will be carried out but partially and imperfectly. I wish to emphasize the conviction gained by many years of experience with this class of soldiers that unless it is made pecuniarily profitable to remain in the service, the majority of the tuberculous will sooner or later prefer to be discharged and return to their homes rather than to submit to a course of treatment, even though this treatment aims at and often succeeds in effecting a permanent cure. The heart of the philanthropist glows at the thought that a generous nation is willing to keep on its payroll soldiers who can never again fight on its behalf, that it expends large sums in providing means by which these unfortunates may be cured of their disease and trained to work, or if the conflict goes against them, may be furnished an asylum in which they can spend their last days in peace. But if we are to practice philanthropy successfully, we must know the world as it is, not as we could wish it to be. These patients are not, as a rule, philosophers and sages. They know little or nothing of the treatment of tuberculosis or of the results that are to be expected from it, or of the way in which such results may be obtained. Yet many of them prefer to follow their own judgment rather than listen to advice. Such men pass quickly from an unfounded optimism to its opposite, an equally unreasoning pessimism. They wish to go home today, because they are doing very well and they can pursue the treatment to equal advantage there. Tomorrow, perhaps, they will say that it is of no use to persist in the treatment, that they are not gaining in health and that they might as well go to their homes and get such pleasure as they can from what remains to them of life. Not only the weaknesses but also the best emotions of the human heart are enrolled on the side of the opposition. The love of the patient for his family, the yearning of the wife or of the mother for the husband or son are so many cords drawing him away from what we conceive to be the path of duty. We cannot blame him if he yields; only the careless or the recreant could be insensible to such pleadings. Yet they are the voice of the siren, nevertheless, enticing him to renounce a future good for a present enjoyment. The real love for wife or mother would say: "You are dear to me, and therefore I cannot come. I love you so much that I must stay and try to save my life for your sake. I must forget you in the present in order that I may enjoy you during a long future." There is a wisdom and a moral heroism in such a resolve which commands our respect. Would that we could affirm that so heroic a determination is invariably rewarded by the success it deserves. It is sometimes a bitter thought to the physician who has persuaded the patient to stay, that he has been responsible for keeping a patient uselessly under treatment and of thus depriving him of the loving care that friends would have lavished on him if they had been allowed the chance. Here the only consolation is the thought that so far as could be determined at the time, the decision made was the correct decision even though the result was ultimately disaster, and that the unfortunate patient gave a better proof of his affection by remaining to fight than if through weakness he had given up the conflict. But what an incentive for the physician such an event is, to give the best efforts of which he is capable in order to understand, so far as fallible man can, the nature of the disease he is seeking to combat!

UNTHINKING PHILANTHROPY

The philanthropist himself is sometimes inclined to interpose with benevolent motives to ask for action which is really to the prejudice of the patient. Thus a priest implored the hospital management in the name of God to release a patient who lived in comfort in the balmy air of the Southwest in order that he might go in the dead of winter to a bleak district of the North and to a humble home destitute of all suitable accommodations for a sick man.

Now that we are speaking of the philanthropist may I be pardoned for a slight digression? It is this: A surprising feature in many interested in philanthropy is their apparent lack of civic conscience. It is the fashion today to spend money with a lavish hand for all sorts of good things, perhaps sometimes to spend more than the goodness of the thing really warrants. When the reaction comes and taxes grow irksome, as they become more familiar, there will be a day of accounting; and in that day the size of the pension list or, more accurately, the list of those entitled under the present law to compensation will be one of the numerous things that will be severely criticized. The regular army officer brought up in an economical school has striven to diminish, as much as in him lay, the size of this list by seeking to exclude from it those who had entered the army through some oversight with tuberculosis contracted long before, a condition therefore for which army service could not justly be held accountable. This laudable effort to help the future taxpayer has, however, encountered the most strenuous opposition on the part of various philanthropists, many of them women. Though the man whose cause they champion had been in the army only a month before his disease was discovered, and though that disease was of the most chronic type, they are quite sure that the poor man had been perfectly well until he left his home and entered the army, and that the exposure of army life had certainly been the cause of all his troubles and that the government should without any doubt be required to support him.

Even the philanthropic life has its drawbacks. How different is reality to the dreams of the unthinkingly benevolent in which all the good is on one side and all the bad is on the other, and it is perfectly easy to determine what the proper course is. Such considerations, however, should not discourage philanthropy, but rather inspire caution in the practice of it. Philanthropy can be truly benevolent and altogether beneficial only when those who would benefit their fellow men are willing to make an exhaustive study of the conditions.

Physicians are constantly seeking new and infallible means of diagnosticating disease. Very often a discovery is heralded as a means of establishing a certain diagnosis in some morbid state. But almost always when the first enthusiasm abates it is found that, after all, there are exceptions. The new sign or reaction is not absolutely pathognomonic. There never will be a time when a physician can practice his profession with scientific success without the use of all his brains and all his acumen. And it is very much the same way with philanthropy. Measures which seem beneficial may produce evils. What is best for one class at one place may not be best for all classes at all places. There is no easy way of always deciding what it is best to do.

PREVENTION OF TUBERCULOSIS AMONG CHILDREN

It is a pleasure, therefore, to be able to point out one philanthropic measure which is too much neglected for other measures really of much less importance, yet with regard to which there can be no doubt that it is a long step in the direction of abating the scourge of tuberculosis. I refer to the prevention of tuberculous infection among young children. I have expressed a doubt as to the seriousness of the danger of infection for the adult who has already come into contact with the tubercle bacillus. There is no question, however, that so far as the young child is concerned, where there is virgin soil for the tuberculous infection, tuberculosis is as infectious as measles. In civilization it must needs be that infection with tuberculosis come sooner or later to all; but it is important that the infection shall not come too early in life, and of the utmost importance that when it does come the size of the infection shall be small and that it be not frequently repeated.

Another measure of perhaps equal importance is the enforcement of the best conditions of hygiene as respects fresh air and sunlight and food for the growing child in order that it may have strength to master the small infection and convert it into a beneficent vaccination instead of permitting it to grow till it becomes a life-long menace and too often a source of death. It cannot be pointed out too often that in spite of our neglect of elementary precautions, the majority of our population nevertheless succeed in obtaining unconsciously that beneficent vaccination so that no matter the exposure, they do not acquire a clinical tuberculosis. What we must do by our philanthropy is to devise means whereby the unfortunate third or fourth of our race who are now not so successful in their struggle against the enemy may be enabled to join the more fortunate majority until the percentage of active tuberculosis becomes reduced to an insignificant fraction and finally vanishes entirely. Given wise philanthropy which persists in its endeavors, this is no utopian dream. Whether tuberculosis as a menace and a drain on society shall be eradicated or not depends on the care which shall be extended to the coming generations of children still unborn. To abolish the slums, to improve the housing conditions in general of the poor, to teach proper cookery, proper selection of foods and the benefits of fresh air, sunlight and cleanliness is to hasten the advance of sanitation along the road on which progress has already been made from generation to generation. Tuberculosis is already slowly diminishing in prevalence as a manifest disease in most countries. We can do much, however, to hasten its disappearance by our organized philanthropy if wisely directed. Yet all these means will fail to attain what we could wish unless we add one additional measure, the segregation of the infant from sources of contagion. The French have seen the light more distinctly than other nations. In France the formula is: Either remove the young child from the presence of the consumptive or the consumptive from his family, if there are young children. The child must by all means be prevented from receiving the massive infections which it is sure to get if it lives with the coughing consumptive.

Here is a definite program, but what a difficult one, for against it are all the impulses of the most sacred affection, the love of parents for their children. This brings us back to the consumptive soldier. At the beginning of the war it was recommended that the tuberculous should be returned to the vicinity of their homes for treatment in order that they might visit their families or that their families might visit them. This I call unthinking philanthropy. Often it is true such visits might do no harm, but the distinction between harmless and harmful is not clearly made. The new baby will infallibly be brought along for the father to see it, unless education is vigorously instituted in advance of the father's return. What an advantage for the children if the father cannot come home to them! How much higher the moral elevation of the man who is taught to sacrifice his paternal yearnings to the best interests of his children, than that of him who cannot consent to live without his family! There is much to be effected in this direction by careful instruction of the consumptive and of the adult members of his family. But what shall be done with the minority of the careless and the wilful—those who cannot or will not understand, the weaklings who are ready to sacrifice the welfare of their infants to their own selfish longings? Shall they be restrained by the hand of the law or shall their children be taken from them to be cared for in public institutions? The French say, yes. What shall we say when the question must be met? Do we recognize sufficiently that true philanthropy sometimes hides behind a mask of sternness?

CARE OF CONSUMPTIVE SOLDIERS AND THEIR FAMILIES

Nothing could be finer than the spirit of our people in these sad times. Nearly all are anxious to help in some way, feeling that they must do something for their country. Sometimes there is the regret on the part of those who must stay at home that there are not more numerous ways in which they can do something really useful and sacrifice their ease and pleasure to some good purpose in the cause of patriotism. Intelligent cooperation in the care and management of the wounded and sick soldiers and in providing for their families is one of the directions in which the energies of the charitable can find an outlet. I bespeak your interest and sympathy for that peculiarly unfortunate class, the consumptive soldiers and for their families. Would that I could hope that my words have thrown some light on the difficult problems which must be met in the sociological study of the tuberculous and its practical benevolence as extended to them.

It is commonly remarked that this terrible and gigantic war has changed the world. We shall never again be the same people. The moral uplift of the present is unmistakable. We are willing to sacrifice ourselves now for our country. May we not hope that this patriotic devotion, this moral uplift, will continue after the war has ended? We are willing now to get together, to labor in unison for our soldiers. We are willing to work at hard tasks, without compensation oftentimes, in order that the business of the country may cooperate to the best advantage with the fighting force. Why should not this organized effort continue after the war? Our country is no less our beloved country because peace has come. Why should we not put our team-work in which we are now so experienced at the disposal of the noble cause of philanthropy, see that the poor are not oppressed, know what goes on in our jails, our asylums, our workhouses, elevate the submerged fraction of the population, and abate the causes of disease and accident. His army experience is but an episode in the life of the tuberculous soldier. He, as a rule, owed his tuberculosis to the conditions of civilian life before he entered the army. The tuberculosis of the army merges into that of the whole population. The great problem of tuberculosis will remain after our army has laid down its arms as one that calls for all our efforts, yet is, we may confidently believe, a problem for which in time we can, we must, find a triumphant solution.

WAR EDEMA (KRIEGSOEDEM)

F. S. PARK, B.A., M.B. (Tor.)
Captain, C. A. M. C.; Former Medical Officer, Fourth C. M. R.
TORONTO

From June, 1916, until February, 1918, I was a captive in the hands of the Germans, and for the most of that time I was employed as medical officer at Minden, one of the largest concentration camps for prisoners of war in the province of Westphalia. During my thirteen months there, many thousands of prisoners of all the Allies passed through our hands. One of the most prevalent diseases observed there was the condition called by some German observers *Kriegsoedem* (war edema), or, as it was officially known at Minden, *Erschöpfungszustand mit oedem* (state of exhaustion with edema).

ETIOLOGY

The condition was found chiefly among the Russians and Roumanians, and was especially common during the spring and summer of 1917. Latterly, the Italians captured in the autumn of 1917 were the chief sufferers. The French prisoners at reprisal camps and the English prisoners, who were kept working on lines of communication, also suffered from the disease. In other words, this disease was found among those prisoners who received only German rations, and the disease was most prevalent at the time when the German rations were poorest, that is, the spring and early summer of 1917. During my stay at Minden, I saw about 400 cases in all.

Undoubtedly, insufficient food is the cause of the condition. The German ration is very low in protein and is almost fat free. Unfortunately, accurate analyses could not be made. As the food is given almost entirely in the form of soup, a large quantity of fluid is ingested to obtain a small amount of nourishment. I found that many of these men were in the habit of taking considerable quantities of common salt in solution in addition to their soup. As the whole organism was weakened from insufficient food and hard work, it is conceivable that the extra load of fluid was too great to be eliminated.

CLINICAL HISTORY

The condition commences as a slight edema of the feet and legs, disappearing when the patient is recumbent. Patients were seldom admitted to hospital in this stage, although rest in bed would restore them in a short time.

The usual type admitted to hospital presented a massive edema of the legs, thighs and genitalia, with some puffiness of the eyelids. In bad cases there was edema also of the chest and abdominal walls. Patients complain of general weakness and pain in the legs, especially in the tibiae. They are usually very apathetic. There is extreme muscular wasting and marked pallor. The whole appearance is strikingly similar to that found in chronic parenchymatous nephritis. Uncomplicated cases are afebrile.

The heart dulness is slightly increased to the left. The apex beat is diffuse and feeble. The heart's action is regular, but usually slow. Muscular tone is poor. The blood pressure is low.[1] Hydropericardium was present in a number of cases, but never marked.

Hydrothorax was common and usually bilateral. It was sometimes most copious. In one case I removed 15,000 c.c. by a series of six punctures during a space of two weeks.

Ascites was very common and was sometimes extreme, necessitating paracentesis.

The liver, spleen and kidneys were not palpable.

The amount of urine was variable. At first scanty, it became profuse, as the patient recovered. It never contained albumin or casts. No quantitative chemical tests could be made.

COURSE OF DISEASE

In most uncomplicated cases the patients improved slowly with rest in bed and an increase of German rations. Where abundant food, including meat and fat, could be obtained and was tolerated, improvement was rapid, even without rest. Digitalis and theobromin sodiosalicylate were used, but without appreciable result. Edema of the legs after work persisted for several months, even after the patient had improved markedly in general strength. Relapses were common.

COMPLICATIONS

Dermatitis of the legs was common, and in a few cases lymphangitis and cellulitis.

Bronchitis frequently was present, and in most of the fatal cases there was bronchopneumonia and edema of the lungs.

Colitis, with mucus and blood in the stool, was the most common and troublesome complication. No specific organism was isolated as a cause of this colitis. It is significant that diarrhea of this type rarely occurred among the well-fed prisoners, although they were exposed to the infection, if this was an infectious diarrhea. As a complication of edema, this colitis was often fatal.

PATHOLOGIC FINDINGS

About twenty necropsies were performed in cases of war edema. The most striking feature was the total absence of fat in the body. At the normal sites for fat deposit, in the subcutaneous tissue, in the omentum and mesenteries, about the kidneys and on the heart, the fat was replaced by edema, producing a translucent, gelatinous tissue.

The heart muscle was pale and flabby. The ventricles were moderately dilated.

The pericardium, the pleural sacs and the peritoneal cavity were filled with clear fluid. Old pleural adhesions were often found, and in one case there were many peritoneal adhesions between the liver and the diaphragm.

The lungs usually showed bronchopneumonia and edema.

The kidneys, liver and spleen were pale, but otherwise showed no macroscopic changes.

The liver was usually small.

When colitis had been present, there was thickening and hyperemia of the rectum, sigmoid and the descending colon. Two cases of superficial ulceration were found.

CONCLUSIONS

Kriegsoedem is the result of underfeeding. I believe that the absence of fat in the diet is the chief factor in causing the condition. It is possible that there may be also a mechanical factor in its production. There is *general asthenia* as a result of hard work, exposure, insufficient food and depressing environment. The large amounts of fluid ingested, together with the increased amount of sodium chlorid, may form too great a load to be eliminated by a weakened myocardium through poorly nourished kidneys.

---

[1] No facilities were allowed me for the proper estimation of blood pressure, for blood examination or histologic work. Also the collection of statistics was forbidden me, so that I have been unable to give exact figures with regard to cases.

THE PREDISPOSITION OF STREPTOCOCCUS CARRIERS TO THE COMPLICATIONS OF MEASLES

RESULTS OF SEPARATION OF CARRIERS FROM NON-CARRIERS AT A BASE HOSPITAL *

ROBERT L. LEVY, M.D. (Baltimore)
Captain, M. R. C., U. S. Army

AND

H. L. ALEXANDER, M.D. (New York)
Lieutenant, M. R. C., U. S. Army

CAMP ZACHARY TAYLOR, LOUISVILLE, KY.

It is evident from reports coming from various Army cantonments[1] that measles, because of the severity and frequency of its complications, must be regarded as a serious camp disease. Complications necessitate long hospitalization and cause, therefore, a high noneffective rate; bronchopneumonia and empyema have been responsible for many deaths. With surprising uniformity, the complications have been due to infection with a hemolytic streptococcus.

In the report of a commission[2] sent by the Surgeon-General of the Army to study the pneumonia at San Antonio, Texas, two significant facts concerning the relation of the streptococcus to the complications of measles were pointed out: First, a relatively small number of measles patients (11.4 per cent.) harbored this organism in their throats on admission to the hospital; second, many more acquired *S. hemolyticus* in their throats for the first time during their stay in the wards. It was therefore inferred that at Fort Sam Houston, at least, the high incidence of bronchopneumonia and empyema during convalescence from measles might be directly related to the transfer of the infectious agent from one patient to another in the wards of the hospital.

[2] Cole, Rufus, and MacCallum, W. G.: Pneumonia at a Base Hospital, The Journal A. M. A., April 20, 1918, p. 1146.

PLAN OF THE PRESENT STUDY

Ward Routine.—On admission to the hospital, all measles patients were sent to a special "measles receiving ward," which was divided into cubicles by sheets, and where every patient was required to remain in bed. Each day throat cultures were taken on those admitted during the preceding twenty-four hours. Carriers of *S. hemolyticus* were on the following morning sent to the "dirty" wards. Those whose cultures were negative for this organism were held for another day, and if a second swabbing confirmed the findings of the first, were sent to the "clean" wards. Rarely did the result of a second culture contradict the report of the preceding day. All patients in each ward were swabbed again at least once a week. On discovering that a "clean" patient had become a carrier in the hospital, he was promptly transferred to a "dirty" ward.

A separate ward was set aside for the reception of post-measles pneumonia, to which, immediately on the recognition of this complication, patients were transferred.

In both "clean" and "dirty" wards, cubicle isolation was strictly observed. Each patient was provided with a gauze mask, changed every twenty-four hours, and was required to wear this mask constantly when not in his own cubicle. For infringements of this rule, punishments were meted out by the ward surgeon, who also daily gave a short talk to ward personnel and patients on the rationale of the various measures for isolation. In this way better cooperation was insured.

Ward surgeons, nurses and orderlies, when in the ward, were properly masked and gowned.

All patients, in bed or convalescent, were fed in their own cubicles; three or more waiters, chosen from among the convalescents, served the food. At all times, but especially during meal hours, crowding together was prohibited; each man ate either in bed or at his own bedside. In the washroom, only one man was permitted at a time; in the latrines, the masks were worn and no more were allowed to enter than could be accommodated at any one time. A guard, changed every two hours and picked from among the convalescents, was stationed at the door of the latrine to insure the enforcing of these rules. No smoking was permitted.

It may well be asked why such rigid precautions were observed in wards in which only either carriers or noncarriers were cared for, and why these measures are described in detail. As pointed out by Cole, and repeatedly confirmed in our own experience, *S. hemolyticus* is very readily transferred from one individual to another, and no matter how strict the supervision, an occasional lapse in discipline is bound to occur. The slightest break in the chain of precautions may result in disaster. For example, in a "clean" ward, throat cultures made at intervals of a few days revealed the fact that several "clean" cases were being converted into carriers. On swabbing the personnel of the ward, it was found that two orderlies and a nurse harbored *S. hemolyticus* in profusion in their throats. On replacing these individuals with noncarriers, no further contamination occurred. This experience taught us to provide the clean wards with a personnel of noncarriers.

In the "dirty" wards, it is desirable to prevent one individual from becoming a carrier of another patient's strain of streptococcus; for different strains may vary in virulence. It is also worthy of note that among the 388 cases of measles described in this report, only two instances of cross-infection occurred, namely, two cases of mumps, probably admitted to the measles service in the incubation period of parotitis. Capps[3] has recently emphasized the value of masking in the prevention of cross-infection in contagious wards, and has outlined a number of ward measures similar to those here described.

Laboratory Technic.—Cultures from the pharynx and tonsils were taken at the bedside with straight swabs, which were then placed into about 1 c.c of beef infusion broth (+ 0.1), shaken and brought to the laboratory. There they were plated without incubation on 10 per cent. human blood agar plates. In order to insure proper separation of colonies, it was essential to rinse each swab thoroughly by twirling it forcibly against the side of the test tube, then wiping it further at the periphery of the plate, and streaking lightly. After from eighteen to twenty hours' incubation, single hemolytic colonies suggestive of streptococcus were transplanted into beef infusion broth (+ 0.1) and grown for twenty-four hours, when cultural characteristics, staining reactions and morphology were noted. Bile solubility was done only when the pneumococcus was suspected. Fermentation reactions and the degree of hemolysis were not studied.

S. hemolyticus occurred in wide variation in numbers, from but one or two colonies on a plate to almost pure cultures. That this variation was not due to the method of plating was confirmed by repeated swabbing of individuals, with fairly constant findings. Exceptionally, on one day a single or possibly a few colonies might be found, whereas a subsequent culture would reveal none. It therefore seemed worth while to differentiate between the "slightly infected"—those whose cultures showed only an occasional hemolytic streptococcus colony—and the "heavily infected." Those cases were classed as negative in which cultures at no time showed the presence of *S. hemolyticus.*

Twenty sputum cultures were made by spreading a fragment of thoroughly washed sputum over the surface of a blood agar plate. Bronchial secretions were obtained when possible. Of thirteen cultures from streptococcus carriers and seven from noncarriers, all corresponded to the throat swab findings, thus demonstrating that the throat culture is apparently an index of the presence or absence of *S. hemolyticus* in the lower respiratory tract.

INCIDENCE OF STREPTOCOCCUS CARRIERS IN MEASLES PATIENTS ADMITTED TO THE HOSPITAL

Table 1 is self-explanatory. These figures are in striking contrast to the percentages prevailing at Fort Sam Houston, Texas, where only 11.4 per cent. of measles patients were carriers of *S. hemolyticus* on admission to the hospital.

---

[3] Capps, J. A.: A New Adaptation of the Face Mask in the Control of Contagious Disease, The Journal A. M. A., March 30, 1918, p. 910.

Of the eighty-nine noncarriers admitted to the wards, twenty-seven became infected during the period of their hospitalization. Contamination for the most part occurred during the early stages of the work, when the ward routine had not been firmly established. These cases are, of course, in the final analysis, classed with the carriers.

TABLE 1.—RESULTS OF THROAT CULTURES IN MEASLES ADMISSIONS

		Number		Per Cent.	
Noncarriers		89		22.9	
Carriers	Heavily infected	299	251	77.1	64.8
	Slightly infected		48		12.3
Total		388		100.0	

RELATIVE INCIDENCE OF COMPLICATIONS AMONG CARRIERS AND NONCARRIERS

Coryza, bronchitis and a laryngitis of variable severity, associated with an initial fever of from three to six days' duration, have been almost constant early accompaniments of each case. A majority of patients have been admitted on the second or third day of the disease, and fever occurring after the tenth day of hospitalization has been regarded as pathologic. Often it was indicative of a manifest complication; but of the uncomplicated cases, forty-seven, or 30.4 per cent., had transient, unexplained elevations of temperature frequently associated with headache and general malaise, but many times without symptoms or ascertainable cause. These unexplained febrile paroxysms, usually of from one to four days' duration, have formed an interesting, though puzzling, feature of the clinical course. They were noted a little more frequently among carriers (17.5 per cent.) than among noncarriers (12.9 per cent.).

TABLE 2.—COMPLICATIONS

Complications	Carriers		Noncarriers	Total	Remarks
	Heavily Infected	Slightly Infected			
Bronchopneumonia	45	2	0	47	Fourteen of these patients are dead at the time of the present writing; some have been operated on for empyema; a number are still in the hospital
Acute tonsillitis	18	7	1	26	
Acute bronchitis	22	1	2	25	Not to be confused with the initial bronchitis
Actve suppurative otitis media	21	1	0	22	On culture, 9 specimens of pus showed S. hemolyticus; 2 Staphylococcus aureus
Empyema	15	0	0	15	All followed bronchopneumonia; on culture, 13 pleural fluids showed S. hemolyticus; 1, pneumococcus
Acute sinusitis	7	3	0	10	
Peritonsillar abscess	7	0	0	7	
Erysipelas	6	0	0	6	The face was affected in each instance
Cervical adenitis	4	1	1	6	Glands quite large, but never suppurated
Peritonitis	1	0	0	1	A terminal infection
Septic meningitis	1	0	0	1	A terminal infection
Totals	147	15	4	166	
	162		4	166	

Of the 388 cases, in 119, or 30.6 per cent., there were complications, a number of patients suffering from more than one. The complications are given in Table 2 in the order of their frequency.

An analysis of this table brings out a number of interesting points:

1. The complications of measles have occurred almost exclusively among streptococcus carriers, the incidence in this group being 36.8 per cent., as contrasted with 6.4 per cent. in "clean" cases. Furthermore, the four complications noted among the noncarriers have been of distinctly minor nature—two instances of acute bronchitis, one of acute tonsillitis, and one of cervical adenitis. In the slightly infected carriers, that is, those showing only an occasional colony in throat cultures, complications have occurred less frequently (22 per cent.) than in the heavily infected (38.2 per cent.).
2. Bronchopneumonia occurred forty-seven times, or in 12.1 per cent. of all cases. This complication has been responsible for many deaths; accurate mortality statistics are not available at the time of the present writing. In fifteen, or 34 per cent., of the bronchopneumonias, the patients have developed empyema.
3. On culture, thirteen pleural fluids showed *S. hemolyticus;* one, pneumococcus. From eleven specimens of pus obtained in cases of acute otitis media, *S. hemolyticus* was grown nine times and the *Staphylococcus aureus* twice.
4. Of 326 carriers, either entering the hospital as such or becoming infected after admission, 211, or 63.2 per cent., have had no complications.

ACQUISITION OF THE CARRIER STATE IN THE WARDS

Reference has already been made to Cole's observations on the ease with which *S. hemolyticus* may be spread from one individual to another in the ward of a hospital, though it is not mentioned that during the period of these observations cubicle isolation or other precautions to prevent the spread of infection were observed.

Experiments were therefore carried out in which wards were "mixed," that is, were filled half with "clean," half with "dirty" patients, in alternate beds. Newly admitted measles patients, convalescents and patients with complications composed the ward roster. All the precautions previously noted were rigidly enforced in order to prevent the contamination of "clean" by "dirty" patients. Yet in one ward, in which fifteen "clean" and fifteen "dirty" patients were placed, at the end of a week, only six noncarriers remained. In another ward of twenty-four, of whom at the start twelve were noncarriers, at the end of the week only three "clean" cases were found. Those patients who became "soiled" as the result of this period of exposure were for the most part classed as "slightly infected." These observations emphasize the importance of rigidly observing every precaution to prevent contact spread, though casting considerable doubt on the efficacy of the methods herein described. Therefore, when possible, if the incidence of complications is to be reduced, carriers and noncarriers should be separated, and cared for in different wards. Such a procedure should prove particularly valuable in camps where the number of streptococcus carriers among measles patients is low, as at Fort Sam Houston, Texas.

DIFFICULTIES OF ERADICATING THE CARRIER STATE

Throat cultures made at intervals in many of the "dirty" wards have shown that the carrier state, once acquired, persists throughout the patient's stay in the hospital. There have been rare exceptions to this rule.

Attempts at mouth disinfection have not been successful. Neutral solution of chlorinated soda in half strength, which has been in common use as a gargle and spray in this and other Army hospitals, will not kill *S. hemolyticus,* even in vitro. Experiments with other mouth antiseptics, notably iodin in glycerin, though successful in the test tube, have been clinically most disappointing. The organisms, apparently safely lodged in the crypts of the tonsils and in the lymphatic tissues of the nasopharynx, are not accessible to the local treatments so far employed. Of the patients discharged from the hospital, 71.7 per cent. still harbored *S. hemolyticus* in their throats.

EPIDEMIOLOGY

It was shown earlier in the year by one of us[4] that Camp Taylor was heavily infected with *S. hemolyticus,* and during the past four months representatives from almost every organization have entered the base hospital with lesions caused by this organism. In the present epidemic of measles, it was striking that of the 388 cases studied, 346, or 89.1 per cent., came from the One Hundred and Fifty-ninth Depot Brigade, an organization into which all new men entering camp are attached during the early period of their training. Accordingly, throat cultures were made on ninety-five men of Company 5 (Second Battalion), composed of individuals from various parts of the brigade, most of them having been in service about six months. Of these, seventy-nine, or 83.2 per cent., were carriers of *S. hemolyticus,* 64.3 per cent. being heavily infected, 18.9 per cent. showing only an occasional colony on the plates.[5] All were apparently healthy.

If these observations, made on a representative company, may be used as an index, a high percentage of soldiers in the depot brigade harbor *S. hemolyticus* in their throats. The question naturally arises, Do these men come from civil life as carriers, or do they acquire the organism in camp? The recent draft afforded an exceptional opportunity for determining this point. Throat swabs were taken on 489 new recruits, representatives of both urban and rural communities, as they stepped from the train. Of these cultures, 14.8 per cent. showed the presence of hemolytic organisms.[6]

The inference is obvious. It has previously been shown that Camp Taylor is heavily seeded with *S. hemolyticus.* A large number of the men, therefore, acquire the streptococcus carrier state during their sojourn in camp.

SUMMARY

1. Of 388 measles patients admitted to the base hospital at Camp Zachary Taylor, Ky., 299, or 77.1 per cent., were found to be carriers of *S. hemolyticus.*

2. A ward routine was instituted in an attempt to prevent the contamination of noncarriers by carriers in the hospital. All patients were admitted to a special "measles receiving ward," where throat cultures were made. Carriers of the streptococcus and noncarriers were there separated and sent to wards designated, respectively, as "dirty" and "clean." In these wards rigid precautions were observed, the most important of which were cubicle isolation, masking of patients and attendants, guarding of latrines to prevent crowding, the feeding of each patient in his own cubicle and, in the clean wards, supplying orderlies and nurses who, by throat cultures, had been proved noncarriers.

3. Complications occurred in 119 cases in the series (30.6 per cent.); a number of patients suffered from more than one. In order of frequency the complications were: bronchopneumonia, acute tonsillitis, acute bronchitis, acute suppurative otitis media, empyema, acute sinusitis, peritonsillar abscess, erysipelas, cervical adenitis, peritonitis and septic meningits.

4. The complications occurred almost exclusively among streptococcus carriers, the incidence in this group being 36.8 per cent., as contrasted with 6.4 per cent. in "clean" cases. Furthermore, the complications noted among the clean cases were of distinctly minor nature.

5. Bronchopneumonia occurred forty-seven times, or in 12.1 per cent. of all cases, and caused many deaths. Fifteen, or 34 per cent., of the bronchopneumonia patients developed empyema.

6. Cultures of pleural fluids and pus from ear discharges have for the most part shown *S. hemolyticus.*

7. Of 326 carriers, 211, or 63.2 per cent., have had no complications.

8. Even while observing the precautions outlined, "clean" patients became contaminated when a ward was "mixed," that is, filled half with carriers, half with noncarriers. These observations cast some doubt on the efficacy of the ward measures described.

9. Strictly "clean" wards remain "clean." Therefore, if the incidence of complications in measles is to be reduced, carriers and noncarriers must be separated and cared for in different wards. This procedure should prove particularly valuable in camps where the number of streptococcus carriers among measles patients is low.

10. Attempts at eradicating the carrier state by the use of mouth antiseptics have failed. Of the patients discharged from the hospital, 71.7 per cent. harbored *S. hemolyticus* in their throats.

11. Throat cultures were made on ninety-five men of a representative company in the One Hundred and Fifty-Ninth Depot Brigade, the organization from which came 89.1 per cent. of measles patients in this series. Seventy-nine, or 83.2 per cent., of the men in this company, though apparently healthy, were carriers of *S. hemolyticus.*

12. Throat swabs taken on 489 new recruits as they stepped from the train showed the incidence of streptococcus carriers to be 14.8 per cent.

13. A large number of the men at Camp Zachary Taylor, therefore, apparently acquire the streptococcus carrier state during their stay in camp.

The Sources of Energy.—The work of the world is accomplished in largest part by the oxidation of carbohydrates, that is to say, of sugars and starches. Bread, corn, rice, maccaroni, cane sugar, these are par excellence the food fuels of the human machine. In the dinner pail of the laborer they testify as to the source of his power. They are convertible into glucose in the body, which glucose gives power to the human machine. They may be used for the production of work without of themselves increasing the heat production of the worker, as happens after meat ingestion.—Lusk, Food in War Time.

---

[4] Alexander, H. L.: Hemolytic Streptococcus Causing Severe Infections at Camp Zachary Taylor, Ky., The Journal A. M. A., March 16, 1918, p. 775.

[5] At Camp Custer, Battle Creek, Mich., Irons and Marine, during a period of respiratory infections, made a large number of throat cultures on selected companies. Hemolytic streptococci were found in about 70 per cent. of apparently healthy soldiers.

[6] The circumstances under which these cultures were taken made it impossible to d[illegible]ne the colonies further.

PROCEEDINGS OF THE CHICAGO SESSION

MINUTES OF THE SIXTY-NINTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT CHICAGO, JUNE 10-14, 1918

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 10

The House of Delegates met in the home of the American Medical Association, 535 North Dearborn Street, and was called to order at 10 a. m. by the Chairman, Major Hubert Work, Pueblo, Colo.

Chairman's Address to the House of Delegates

Dr. Hubert Work, Chairman, presented the following address:

To the House of Delegates of the Sixty-Ninth Annual Meeting of the American Medical Association:

Your presiding officer has few recommendations to make and none to urge, holding it to be indelicate at least, to invite legislation on which members of the house might entertain different views.

It is probable that this House of Delegates has not heretofore exercised its initiative function fully as the governing body of the Association. Apparently, it has done so to its own satisfaction and to the sufficient protection of the Association, but while the officers you elect represent you, you in turn represent the profession, which may sometime expect from you closer supervision. Lack of contact breeds distrust, and ignorance of facts encourages groundless suspicions but cooperation of efforts secures the highest success.

The successful career of our Association with the proud position its journal occupies with both medical and lay press, is a tribute to your previous selection of officers, yet I believe that the members of this house should activate their obligations to the Association between annual sessions.

I would remind you of the physical value of this plant, of the money on hand and invested, for which you are responsible; of the importance of this Association to our people at peace, and of its attitude in war. Its journal has become the authentic, quoted roster of the Medical Department of the Army by common consent, and its Military Medical Honor Roll together with its survey published a week ago has not been equaled as foundation work.

By invitation your chairman has attended all trustee meetings. The business methods and exactions of your trustees enforced in this great publishing house would, I believe, appeal to you. The management is alert in medicine, and financial detail is governed by the rules of all trust companies.

An Ad-Interim Committee of the house was proposed a year ago, but not pressed for some reason.

Your Secretary will report the action of a War Committee improvised by your authority to meet an emergency call for help.

The war into which we have been drawn is a war of the chemists. Its motive power, its devices for destruction and its medication of wounds are all chemicals and their combinations. The destructive science of chemistry must kill immediately or the healing aids of chemistry will cure ultimately.

As never before, medicine has proved our faith in it by what it has accomplished. The science we represent has demonstrated to all sects, pathies and unbelievers, its quality by its performance in a world crisis. The profession you gentlemen represent is scattered over the world's greatest domain of human intelligence, yet it sensed the common danger, comprehended it and stood at attention quicker than any other profession, trade or business. Our physicians at home no longer press plans for personal advantage. The ununiformed officers of the Selective Service in every community are indeed our medical reserves. They select our soldiers, carry the burdens of those gone and contribute of their earnings to the support of their dependents—surely, chivalry among physicians was never brighter, or the spirit of self-sacrifice a national asset until now—a by-product of our civilization that lay dormant under the complacency of our prosperity.

Surgeons transplant with impunity, either segments or shafts of bone from parts less important, to restore parts necessary to life and the healing of wounds is measured by hours rather than by weeks. These unplumed Knights of the Scalpel practice a new science of surgery, urged by the cry of necessity which opened to them opportunity.

One year ago when this house was convened it was stated that "thousands of our membership were preparing to follow," into the service of the Army. Thousands have followed and we already know that some have "carried on" beyond the war.

Each week THE JOURNAL first opens at our Gallery of Heroes, whose pictures are set over the inscription "Died in Service, M. R. C., U. S. Army." A simple epitaph; at once a eulogy, a requiem and a benediction. It comprehends preparation and service, to which the great seal of approval has been affixed by the United States of America. It matters not at all when we are called, but the manner of our going fixes the fragrance of remembrance. Our American mothers prefer a breaking heart, with pride of memory, to a living presence that needs an apology.

Although the American mind is sensitized by war, our profession must proceed coherently. The burdens war has imposed on the profession are heavy, but we must also forecast the medical problems of the peace to follow, which will tax every resource of our decimated ranks. Our losses by the hand of time, by casualties and of our premedical students, will lay a heavy hand on us afterward.

No one can now be found to say that we will not win the war or that the United States no longer produces the type of men our nation's history was builded around. The two generals through whom the medical profession serves would alone disprove both hypotheses.

The selective draft, predestined by the pacifist to failure, has proved to be the colossal achievement of the times. The man to accomplish it was already in place and able to envision the future, its contingencies and to sense the aroused American mind. Our people are giving up their sons without protest—and the selective service system has been conceivd in detail and established in entirety.

The Judge Advocate-General, who framed the law and who administers it as the Provost Marshal-General, has written the name of Enoch H. Crowder in history.

In this world's crisis, when we can only live through killing, when every device for destruction is employed as an engine of death, from lethal gas to 70-mile guns; poised, undismayed, with faith in his profession and in the science it employs, with the confidence of his government and the devotion of his profession stands the Surgeon-General of the Army.

While the picture from a magazine's page, hanging by one of a uniformed boy in the humblest home, is that of William C. Gorgas; although years of service may have run against him, the mothers of our soldiers will not consent to his retirement, but will pray that his eyes be not dimmed or his natural forces abated.

The trustees bid me say that, having come home, they hope you will sense the welcome, enjoy the freedom and experience the pleasures which are the dues of those who return after a long absence; and when departing, that you will leave, with your adieus, advice, suggestions and instructions to further direct them in their stewardship.

I declare the House of Delegates now open for business.

Reference Committees

The Chairman announced the following Reference Committees:

SECTIONS AND SECTION WORK

John D. McClean	Pennsylvania
Guy L. Connor	Michigan
Frederick T. Rogers	Rhode Island
Thos. Holloway	Ophthalmology
G. A. Moleen	N. and M. D.

RULES AND ORDER OF BUSINESS

C. R. Scott	Idaho
S. W. Welch	Alabama
E. B. Cooley	Illinois
W. T. Williamson	Oregon
A. F. Richards	Tennessee

MEDICAL EDUCATION

E. A. Hines	South Carolina
J. B. Blake	Massachusetts
Wm. S. Lalor	New Jersey
Robert E. Noble	Army
R. M. Funkhouser	Missouri

LEGISLATION AND POLITICAL ACTION

M. L. Graves	Texas
A. E. Bulson, Jr.	Indiana
George H. Kress	California
Southgate Leigh	Virginia
E. E. Harris	New York

HYGIENE AND PUBLIC HEALTH

J. W. Schereschewsky	U. S. P. H.
H. P. Ritchie	Minnesota
Frederic E. Sondern	New York
C. D. Selby	Ohio
J. R. Morrell	Utah

AMENDMENTS TO CONSTITUTION AND BY-LAWS

F. M. Crandall	New York
C. L. Stevens	Pennsylvania
Rock Sleyster	Wisconsin
Henry E. Odell	Navy
C. P. Meriwether	Arkansas

REPORTS OF OFFICERS

H. G. Wetherill	Gynecology
F. E. Murphy	Missouri
S. R. Roberts	Georgia
Torald Sollmann	Phar. and Ther.
H. B. Gibby	Pennsylvania

CREDENTIALS

D. Chester Brown	Connecticut
James W. May	Kansas
Jos. W. Aikin	Nebraska
M. A. Kelso	Oklahoma
Rudolph Horsky	Montana

MISCELLANEOUS BUSINESS

C. E. Humiston	Illinois
M. N. Voldeng	Iowa
H. A. Royster	North Carolina
D. E. McGillivray	Washington
J. H. J. Upham	Ohio

Reports of Officers

Report of the Secretary

The Secretary presented the following report, which was referred to the Reference Committee on Reports of Officers:

To the Members of the House of Delegates of the American Medical Association:

For the year 1917-18, I submit the following report:

MEMBERSHIP

The membership of the various constituent state associations, which constitutes the membership of the Association, according to the records in the Secretary's office, May 1, 1918, was 80,248, as shown in the accompanying table.

FELLOWSHIP*

The Fellowship of the American Medical Association on May 1, 1917, was 44,010. During the past year, 447 Fellows have died, 2,258 have resigned, 312 have been dropped as not eligible, 521 have been dropped for nonpayment of dues and 54 have been removed from the rolls on account of being reported "not found," making a total of 3,592 names to be deducted from the Fellowship roll. There have been added 4,297 names to the Fellowship roll, of which 3,077 were transferred from the subscription list. The Fellowship of the American Medical Association on May 1, 1918, was 44,715, a net increase for the year of 705.

This gain in the number of Fellows, as in previous years, is due largely to circularizing subscribers to THE JOURNAL who were eligible, urging them to become Fellows.

---

* These figures do not include those who are now Fellows by virtue of their being commissioned and on active duty as Medical Reserve Corps Officers but who previously have not been Fellows.

AD INTERIM APPOINTMENT OF COMMITTEES

Under date of Oct. 19, 1917, the following report of the Board of Trustees was submitted by the chairman of the House of Delegates and the secretary to the members of the House of Delegates of the American Medical Association,

TABLE—ORGANIZATION OF CONSTITUENT ASSOCIATIONS

* Not including Fellows of American Medical Association.

Note.—The number of members of the different associations stated in this table is in accord with the membership of the several associations as they were reported to the Secretary on May 1, 1918.

The lack of an effective uniform system for reporting the membership of the state associations accounts for whatever discrepancies this table shows and detracts from the value of the statement.

Component societies are those societies which compose the state association. A component society may include one county or more.

1. The state of Maryland has 23 counties and the city of Baltimore; Missouri has 114 counties and the city of St. Louis.

2. These state associations are divided into district societies, and these are listed in the table as component societies. Some of these districts are smaller and some larger than the county, the county lines being ignored.

3. Provision is made for the physicians in each of these counties to join the component society in an adjoining county.

4. Virginia has recently adopted the plan of organization and is now establishing component county medical societies.

5. This figure includes the Medical Corps of the Army, the Navy and the Public Health Service.

and was adopted unanimously by a postal vote, 116 votes having been cast:

Under date of Oct. 13, 1917, Hugh S. Johnson, Lieutenant-Colonel, Judge Advocate, Executive Officer of the Provost Marshal General, acting for the President of the United States and War Department, addressed a letter to the American Medical Association from which we quote:

"We need the active and vigorous cooperation of the American Medical Association. We need the promptest and most thorough action in this regard. Will you not call together a sufficient number of your executive council to authorize this cooperation by the Association, and to consider a definite and concrete proposition which can be presented here, and upon which we can act?"

Specifically, the cooperation desired of the Association is set forth in the following:

"It is planned to establish Medical Advisory Boards, not necessarily integrated with the territorial jurisdiction of either Local or District Boards, but having headquarters with sufficient apparatus and conveniences so located as to be accessible to boards in the portion of the state in which the Advisory Boards are situated. Any case in which the local examining physician has held the registrant disqualified for service (unless the disqualification is obvious) or in which the local physician is in doubt, or in which the registrant feels aggrieved by the decision of the local physician, or where the Local Board or the Government Appeals Agent desires to appeal the findings of the local physician, is to be sent to such Medical Advisory Board for an exhaustive [medical] reexamination upon which the Local Board can proceed to a final determination."

These Medical Advisory Boards will consist of physicians selected for their ability to make thorough and complete physical and mental examinations. This means that the boards shall be composed of specialists competent to make such laboratory and other examinations as may be required. This matter was of such importance and the urgency was so great that, in accordance with the spirit of the recommendation of the Reference Committee on Reports of Officers adopted by the House of Delegates in June, 1917, i. e.,

"We further suggest to the House of Delegates that it formally and officially offer to the government, through adoption of this recommendation, the services and facilities of the American Medical Association for such assistance as may be in its power to render hereafter",

the Board of Trustees, on Oct. 19, 1917, in special session assembled for the purpose of considering the matter, all the members being present, unanimously adopted the following resolutions:

Resolved, That the Board of Trustees, for and on behalf of the American Medical Association, accepts the invitation to cooperate with the Provost Marshal General in the matter presented in the letter of Lieut.-Col. Hugh S. Johnson under date of Oct. 13, 1917.

Resolved, That a committee of three be and hereby is appointed with full power to act in conjunction with the Provost Marshal General in the premises.

The following committee was appointed: M. L. Harris, secretary, Board of Trustees; Hubert Work, chairman, House of Delegates, and E. J. McKnight, member of the Board of Trustees.

Respectfully submitted, by order of the Board of Trustees.

M. L. Harris, Secretary, Board of Trustees.

Later, the Board of Trustees appointed A. R. Mitchell to fill the vacancy on this committee occasioned by the death of E. J. McKnight, and the President of the Association, the Editor of The Journal and the Secretary were added to the committee as ex officio members. The board further extended the functions of the committee by authorizing it to act in cooperation with the Provost Marshal General's Office, the Surgeons-General of the Army and the Navy and such other military officials as may be deemed best in the interest of and for the successful conduct of the war. It is recommended that the House of Delegates, by action taken at this annual session, shall ratify the postal vote adopting the foregoing report of the Board of Trustees and, if it is in accord with the wisdom of the house, that it shall continue this committee with power to act for the Association in all matters pertaining to placing the Association at the service of the government for the war.

Cooperation with the Surgeon-General of the Army

At its annual session last year, the House of Delegates approved the action of the Secretary in offering, on March 29, 1917, the facilities of the American Medical Association to the Surgeons-General of the Army and of the Navy for whatever service the organization could render in support of the federal government in the prosecution of the war. Following the adoption of the recommendation of the Reference Committee on Reports of Officers whereby the House of Delegates "formally and officially" offered "to the government . . . the services and facilities of the American Medical Association for such assistance as may be in its power to render hereafter," an official communication of this action was transmitted to the Surgeons-General of both the Army and the Navy and was acknowledged by each of them.

It may be of interest to enumerate briefly some of the facilities which the Association has at its headquarters and which in accordance with the foregoing action were made available to the offices of these Surgeons-General.

The facilities at the Association's headquarters are unique: they include information regarding the members of the medical profession which can not be found elsewhere. This information consists of complete records of the membership of the organization, of all licensed physicians, of data compiled from various sources, including matters relating to the professional and social standing of the individual physician. Specially, at the Association headquarters there are:

(a) A card index record of the medical students of the United States showing their preliminary education, the medical schools which they are at present attending and the schools at which each of the years of the medical course has been taken. This covers the last seven years.

(b) A biographic card index of physicians giving, in addition to the student record, information concerning the school of graduation, licenses held, hospitals in which they have served as interns, the places at which they have engaged in practice, etc.

(c) A record of the membership of recognized special medical societies and associations, as well as the names of those who have registered in the various Sections of the Scientific Assembly of the American Medical Association. These records provide information regarding the specialty in which each physician is interested or to which he limits his practice. This information is supplemented by statements from physicians themselves regarding their specialty.

(d) A personal file kept in envelopes which contains a vast amount of personal information concerning physicians; this is in the form of newspaper clippings and reports from various sources.

(e) A file in the Propaganda for Reform department of The Journal containing a most complete list of quacks, irregular practitioners, cults, 'pathies, etc.

In its organization the American Medical Association coordinates the constituent state medical associations and their component county and district societies. This organization reaches every part of the country and practically every physician. Its machinery consists among other things of:

(a) The names and addresses, corrected to date, *in type and ready for use* by the Dick Addressing Machine, of the presidents and secretaries of the state, district and county societies—some 5,156 names—making it possible to address any communication to the organized profession without delay. This is the mailing list for the American Medical Association Bulletin, which publication is available for circularizing any extended matter.

(b) When it is desired to reach the individual members of a county society, a list of these members is also quickly available.

Since the beginning of the war, the office of the Association has, as a routine procedure, made available to the Surgeon-General of the Army all its records relative to the applicants for commission in the Medical Reserve Corps. We have received almost daily lists of names of those making application for commission in the Medical Reserve Corps. When the lists were received, the names were card indexed and the cards distributed among specially trained clerks, who looked up all the information we have concerning each individual. If any information was found which called in question the personal or professional character of any of these individuals, the information was transmitted, without comment, to the office of the Surgeon-General. The amount of time and the extent of the work involved can be appreciated only by seeing the records which are assembled here and noting the response which the medical profession of the United States has made to the call of the government. The members of the House of Delegates are urged to avail themselves of the opportunity afforded at this session to acquaint themselves with the workings of the various departments at this office.

Other features wherein the Association has assisted the federal government are set forth in the reports of the Board of Trustees and of the War Committee.

Memorial to Congress

The following memorial was signed in duplicate by seventeen of the general officers of the Association and by 115 of the 130 members of the House of Delegates of the Association, and on January 30 one set was transmitted to the Vice President of the United States, the presiding officer of the Senate, and the other to the speaker of the House of Representatives. Both were duly acknowledged:

> The undersigned officers of the American Medical Association and the members of its House of Delegates, representing the membership of the various state associations of the United States, comprising in excess of 81,000 physicians, respectfully present the following memorial:
>
> Whereas, Section 209 of the War Tax provides that, in addition to the regular income tax and surtax, there shall be a further tax of 8 per cent. on incomes in excess of $6,000 of all professional men; and
>
> Whereas, Such excess tax is unfair, unjust and vicious, in that it imposes a double tax on those who have no invested capital, but whose earned income is the result of mental effort and personal energy, after an expensive education and a long professional experience—in a word, on those whose income is the product of their brains;
>
> Therefore, In behalf of the medical profession of the United States, we respectfully urge the repeal of Section 209.

Reapportionment

The attention of the House is called to By-Laws, Section 3, Chapter I, page 6. This is the year for reapportioning the delegates of the various state associations; the by-law requires that the House of Delegates shall appoint a committee of five on reapportionment of which the President and Secretary shall be members. I suggest that this appointment be made early in the session, so that the Committee may report to the House as promptly as possible.

Other matters in which the office of the Secretary of the Association has been concerned are reported to the House of Delegates from other sources.

Respectfully submitted,

Alexander R. Craig,
Secretary.

Report of the Board of Trustees

Dr. Thomas McDavitt, Chairman, read the following report, which was referred to the Reference Committee on Reports of Officers:

To the Members of the House of Delegates of the American Medical Association:

In the report of the Board of Trustees made to you last June at New York, we expressed the fear that on account of the war our income from The Journal for the year 1917 might be seriously curtailed, unless strict economy was practiced. It was predicted that there would be great falling off in the number of Fellows and subscribers, and urged that we be prepared to meet the new conditions. As a matter of fact, the year 1917 proved to be a successful one—at least so far as The Journal is concerned. Instead of a falling off, there was an actual increase in circulation, as will be noted by tables in the addendum. On Jan. 1, 1917, the number of subscribers and Fellows was 65,661; on Jan. 1, 1918, 67,315—an increase for the year of 1,654. The actual number of copies printed for the year was 3,504,724, or a weekly average of 67,400.

The number of subscribers in foreign parts is increasing year by year. The total foreign circulation on Jan. 1, 1918, was 1,652. There was no gain in Europe for the year, because what little increase occurred in the countries of our allies was overcome by the dropping from the list of subscribers in enemy countries. On January 1 we had 72 subscribers in China, 114 in Japan, 126 in the various South American countries, and 57 in Mexico. There has been a pretty good increase in all these countries since January 1.

One of the tables gives the percentage in each state of physicians who take The Journal. The average percentage for the whole United States is approximately 46. This is an extremely gratifying record considering all things. There are, sad to say, a large number of physicians who regard The Journal as too scientific, although the relative number of these is rapidly decreasing. But the number of those who take The Journal does not represent the number of its readers; in many instances a number of physicians have access to the same copy, and the copies that go to libraries naturally are read by many. As was stated once before, The Journal reaches a larger percentage of the profession and covers its particular field more thoroughly than does any other journal issued for any other class, profession, trade or specialty.

The revenue derived from The Journal for the past year—that is, for dues and subscriptions, as shown in the Auditors' Report, was $318,487.25.

Advertising

Also, contrary to our prediction last year, there was an increase in the receipts from advertising during the year. The total income from this source was $264,996.52, an increase of over $35,000. Considering the standard of the advertising pages of The Journal, the financial returns are gratifying. The fundamental rule governing advertising is that no proprietary or controlled medicine shall be advertised unless it has been investigated by the Council on Pharmacy and Chemistry and accepted for New and Nonofficial Remedies. The same general principle applies to other articles advertised, viz.: the product advertised must be an honest one, and the claims made for it must not be exaggerated. Naturally this results in the loss of a good deal of advertising, but we are sure that it pays to be thus rigid, even from a commercial point of view.

Cooperative Medical Advertising Bureau

The work of this bureau is giving satisfaction and it is appreciated as a good thing by the various state journals. Without exception the state publications which the bureau represents—and it represents all officially owned state journals except the Illinois—are pleased with the results of this cooperative work.

In 1915 the bureau cost the Association $708, and in 1916, $220; while during the past year in addition to earning its expenses and returning a pro rata honorarium to the state journals of $900, it had $203 to apply as a credit for the year 1918.

American Journal of Diseases of Children

This journal seems to be giving satisfaction, at least if we are to judge by the circulation, which now is 2,415. Considering that it is, in a way, a special journal, and appeals only to those who give special attention to pediatrics, this circulation must be regarded as satisfactory.

We regret to say that there was a loss—$254.29—on the Children's Journal last year, as against a gain of $322.38 the previous year. This loss is due principally to an increase in the amount paid for abstracts during the year.

While the regular price of this journal is $3 a year, practically all the subscribers club it with The Journal or The Archives, and pay only $2 annually.

The Archives of Internal Medicine

What is said regarding the American Journal of Diseases of Children will apply to The Archives of Internal Medicine. The circulation of this journal, as of Jan. 1, 1918, was 2,366—an increase of 264 over the preceding year. Here again there was a loss—and a rather serious one, viz.: $1,635.40, as against a loss of $66.52 the preceding year. This loss is accounted for by the increased size of The Archives. The original plan outlined a journal of approximately 600 pages to the volume, or 1,200 pages a year. But the size has been gradually increasing until the number of pages in the two volumes for 1917 reached 2,082. The regular subscription price is $4 per annum—that is for two volumes. As in the case of the American Journal of Diseases of Children, The Archives is clubbed with The Journal or with the Children's Journal, at $3, and practically all of the subscribers receive it at this figure. This, of course, is too low a price if the size of the journal is to be what it is at present. A comparison with other similar publications is interesting.

The *American Journal of Physiology*, the *Journal of Pharmacology and Experimental Therapeutics*, the *Journal of Urology*, the *Journal of Bacteriology* and the *Journal of Immunology* each cost $5 a volume of not to exceed 600 pages, or $10 a year for those which are issued monthly. The last volumes of these journals had, respectively, 600, 562, 580, 646 and 592 pages.

While the Board of Trustees believes in encouraging these special journals, it is not intended to publish them at an actual loss. The board is considering the advisability of either asking the Editorial Board of The Archives to reduce the number of pages, or increasing the price to $2.50 a volume —$5 a year. If the present clubbing arrangements are continued, this would mean $4 a year for the great majority of subscribers. However, thus far no action has been taken in the matter.

Propaganda Department

The results of the work of this department, so far as it relates to the public, have never been more evident than during the past year. For the first time the inquiries from laymen exceeded in number those from physicians. Possibly this is due to a growing realization on the part of the public regarding the monstrous waste—both in money and in health —connected with the exploitation of worthless or fraudulent medicines.

This department is cooperating with and advising advertising vigilance committees, associations of advertisers and advertising managers of the better class of magazines and newspapers, with the results that those who are behind the scene appreciate that great improvements are taking place in regard to the advertising standard of our leading lay publications. The number of schools and colleges that devote a certain amount of time each session to the economic, sociologic and health phases of the "patent medicine" evil continues to increase. This doubtless is due to the fact that some of the high school and college textbooks on home economics and on hygiene and physiology touch on these subjects and either use the Propaganda's publications or give them as references for supplementary reading and study. The Educational Posters prepared by the department are becoming widely used in such work.

Council on Pharmacy and Chemistry

The war naturally has influenced the work of the Council on Pharmacy and Chemistry and, to a less extent, that of the Chemical Laboratory. Since the war started, no new synthetics or preparations of any kind have been submitted from Germany. Before that time not a month passed that Germany did not send at least one new synthetic or other drug. The value of the Council's endorsement has been recognized by the drug and chemical concerns abroad, and these concerns submitted to the Council practically every product at the outset.

Meanwhile radical changes have been taking place in this country. A large number of synthetics for which we formerly depended entirely on Germany are now being manufactured in increasing quantities by American concerns. Four concerns are now making arsphenamin to take the place of salvarsan, and such products as atophan, veronal, novocain, phenol and phenol derivatives—salicylic acid, the salicylates and particularly acetylsalicylic acid (aspirin), etc., also are being made here. To protect both the public and the profession, as well as to encourage the American manufacture of synthetics, the Council and the Laboratory have willingly investigated the quality of these substitutes for foreign made goods, and when they have been found satisfactory—which has been the case in practically every instance—have accepted them for New and Nonofficial Remedies. Certain members of the Council have been cooperating with the Federal Trade Commission in solving the problem connected with licensing manufacturers to make certain products controlled by German patents.

At the request of the head of the division of supplies in the Surgeon-General's Office, the Committee on Therapeutic Research and Useful Drugs of the Council held a meeting in Chicago, April 26 and 27, to investigate and make recommendations regarding deletions from, and additions to, the list of drug supplies for the Army. Constituted as this committee is, it is thoroughly competent to do this work, and we believe it has been appreciated by the Surgeon-General.

Committee on Scientific Research

In 1900 a committee on Scientific Research was constituted. This committee was continued until 1914 when, in the curtailment of expenses, it was found necessary to discontinue making the annual appropriation for its work. Conditions now are such that the board has felt justified in reestablishing this grant. The committee as newly constituted consists of: Dr. Ludvig Hektoen, Professor of Pathology at Rush Medical College, Chicago; Dr. G. N. Stewart, Professor of Experimental Medicine, Western Reserve University, Cleveland; Dr. A. W. Hewlett, Professor of Medicine, Leland Stanford Jr. University, Berkeley, Calif.; Col. F. F. Russell, Surgeon-General's Office, Washington, D. C.; J. W. Churchman, Professor of Surgery, Yale University, New Haven, Conn., and Herbert Charles Moffitt, Dean and Professor of Medicine, University of California, Medical School.

Disposition of Lawsuits

The active work of the Association in codifying and supplying to the profession and the public information concerning quackery, fraudulent medicines and low-standard medical colleges naturally has resulted in attempts on the part of those affected by such disclosures to intimidate the Association by instituting, or by threatening to institute, lawsuits. It costs very little to institute such suits, and they may be considered as good advertising. Further, they give a semblance to a claim that unwarranted statements have been made. The fact that these cases are practically never pushed to trial, evidences the care the Association takes in determining the accuracy of the information it publishes.

During the past year the followng cases have been disposed of:

In the Circuit Court of Cook County, Ill.:

Julian J. Meyer *vs.* American Medical Association. Alleged damage, $100,000.00.

Organic Chemical Manufacturing Co. *vs.* American Medical Association, and Dr. George H. Simmons. Alleged damage, $100,000.00.

S. Lewis Summers *vs.* American Medical Association, and Dr. George H. Simmons. Alleged damage, $100,000.00.

In the Superior Court of Cook County, Ill.:

John S. Waterman *vs.* American Medical Association. Alleged damage, $100,000.00.

T. Leacraft Hein *vs.* American Medical Association. Alleged damage, $100,000.00.

The cases of Julian J. Meyer, John S. Waterman and T. Leacraft Hein, all physicians, are the result of the exposure in The Journal of the Friedmann Consumption Cure fake. The other two cases, that of the Organic Chemical Manufacturing Co. and of S. Lewis Summers, are to all intents and purposes identical, since S. Lewis Summers is the president of, if not the Organic Chemical Manufacturing Co. These cases were virtually thrown out of court without trial.

The case entitled "People of the State of Illinois on the relation of Maclay Hoyne, State's Attorney, *vs.* W. W. Grant, Frank J. Lutz, Oscar Dowling, W. T. Sarles, Philip Marvel, Philip Mills Jones, M. L. Harris, W. T. Councilman and Thomas McDavitt," was finally reached and was passed on by the Supreme Court in favor of the American Medical Association. The following is the legal history of the case:

In the latter part of 1910, Dr. G. Frank Lydston applied to John E. W. Wayman, then the State's Attorney of Cook County, Illinois, to bring *quo warranto proceedings* against the Trustees of the American Medical Association to oust them from office because they were elected at meetings held outside of the state of Illinois, and because he alleged that the by-laws for the election of delegates to the House of Delegates were contrary to the laws of Illinois. The State's Attorney declined to bring the *quo warranto proceedings.* Dr. Lydston then applied to the Attorney General of the State of Illinois to bring such action in *quo warranto* against the Trustees. The Attorney General also declined to file such a proceeding because the principal office of the American

Medical Association was in Chicago, and for the further reason that the State's Attorney had declined to bring the action.

On April 28, 1911, Dr. Lydston, claiming to act on behalf of the People of the State of Illinois, filed a petition in the Circuit Court of Cook County, Illinois, General No. 305366, against John E. Wayman, State's Attorney, for a *writ of mandamus* to compel the State's Attorney to sign a petition in *quo warranto* to oust the then Trustees from office.

To that petition the State's Attorney filed a demurrer.

On May 18, 1911, the Circuit Court, after extended argument, sustained the demurrer of the State's Attorney and dismissed the petition at relator's cost. Dr. Lydston thereupon prayed and was allowed an appeal to the Appellate Court.

On Oct. 2, 1911, the case was docketed in the Appellate Court of Illinois.

On Oct. 7, 1911, Maclay Hoyne, the then State's Attorney, was substituted for Mr. Wayman.

On Oct. 9, 1913, the Appellate Court, by a divided court, two judges to one, reversed the judgment and remanded the case to the Circuit Court with directions to overrule the demurrer.

By stipulation of the parties the Appellate Court thereafter set aside its judgment, overruled the demurrer which had been sustained by the court below, entered a final judgment awarding a *peremptory writ of mandamus* commanding the State's Attorney of Cook County to sign the information in the nature of a *quo warranto*, and awarded a certificate of importance to the Supreme Court. That state of the record, it was supposed, permitted the State's Attorney to carry the case to the Supreme Court of Illinois.

At the December term, 1913, the State's Attorney filed the record of the case in the Supreme Court and the case was argued at that term.

Feb. 21, 1914, the Supreme Court filed its opinion to the effect that the Appellate Court did not have the power to award a *peremptory writ of mandamus*, and remanded the case *to the Appellate* Court to enter a judgment reversing and remanding the cause to the Circuit Court.

On July 15, 1914 the case was redocketed in the Circuit Court, and on the same date, in obedience to the direction of the Appellate Court, *the demurrer to the petition was overruled.* From that judgment an appeal was taken by the State's Attorney to the Appellate Court. On the call of the case there, it was reargued before a branch of that court different from the one which had made the previous decision.

On Oct. 6, 1915, the second branch of the Appellate Court decided that they were bound by the first decision in that court and affirmed the judgment of the Circuit Court.

On Dec. 20, 1915, the State's Attorney made an application to the Supreme Court for a *writ of certiorari* to review the judgment of the second branch of the Appellate Court, but the Supreme Court denied the writ.

Thereupon, in pursuance of said judgment of the Appellate Court, and on June 27, 1916, the People of Illinois, on the relation of Maclay Hoyne, State's Attorney, filed a proceeding in the nature of *quo warranto* in the Circuit Court of Cook County, Illinois, General No. B-22003 against Drs. W. W. Grant, Frank J. Lutz, Oscar Dowling, W. T. Sarles, Philip Marvel, Philip Mills Jones, M. L. Harris, W. T. Councilman and Thomas McDavitt, Trustees, as defendants, charging that the said Trustees were illegally holding office because elected outside the state of Illinois, under by-laws which were alleged to be illegal under the laws of the state of Illinois. (At this point the American Medical Association is technically brought into the case for the first time.)

On Nov. 13, 1916, a demurrer to the petition in *quo warranto* was filed on behalf of all the Trustees.

On Dec. 16, 1916, after extended argument, the Circuit Court sustained the demurrer of the Trustees.

The People, by the State's Attorney, thereupon perfected their appeal from said judgment to the Appellate Court sitting at its March term, 1917.

After the presentation of printed briefs and upon oral arguments in November, 1917, and full consideration, the Appellate Court filed an opinion, two judges to one, affirming the Circuit Court judgment sustaining the dermurrer, and at the request of The People granted a certificate of importance to the Supreme Court. Such certificate of importance permitted an appeal to the Supreme Court of Illinois.

Thereupon such appeal was taken by the People and came on to be heard upon printed briefs and oral argument at the February term, 1918, of the Supreme Court.

On April 17, 1918, the Supreme Court filed its opinion affirming the judgments of the Appellate Court and of the Circuit Court in the *quo warranto proceedings*, which gave judgment against the People of the State of Illinois and in favor of the Trustees.

This is the first decision by our Supreme Court on the question of whether a corporation not for profit may hold its annual meetings outside of the state of Illinois for the election of its Trustees. The Supreme Court also sustained the by-laws of the Association, which fixed the method of electing delegates to the House of Delegates, and the election of the Trustees by the House of Delegates instead of by the membership at large.

The Appellate Court in a *mandamus proceeding* against the State's Attorney, once decided that such meetings were illegal, but such decision was wholly unauthorized for the reason that it was made in mandamus proceeding, seeking to compel the State's Attorney to sign a petition in *quo warranto.* Under the last decision by another branch of the Appellate Court, the latter held, by a divided court, as above stated in the *quo warranto proceeding*, that the earlier decision of the Appellate Court was not *res adjudicata*, and was not a correct interpretation of the Illinois statute, and affirmed the judgment of the Circuit Court sustaining the demurrer of the Trustees to the *information in quo warranto*, which decision of the Appellate Court is now affirmed by said decision of the Supreme Court.

The Supreme Court takes the ground that, first, the Appellate Court was right in its judgment in the mandamus action in ordering the State's Attorney to sign the information in *quo warranto;* and second, that it was in error in undertaking to pass on the merits which would be involved in the *quo warranto proceedings.* The Supreme Court expresses the opinion further that when it (the Supreme Court) refused a *writ of certiorari* it only intended to agree to the judgment of the Appellate Court directing the State's Attorney to sign the petition in the nature of *quo warranto*, but not to what the Appellate Court said on the merits of the case which would be involved when the questions in that case came before the courts for decision.

That is a most important addenda, since the Appellate Court in its last decision divided on the question whether such earlier decision of the Appellate Court was or was not *res adjudicata* the counsel for the relator, one justice strongly insisting that the Appellate Court's decision in the *mandamus suit* was decisive against the Trustees in the *quo warranto proceeding.*

The decision of the Supreme Court is of great importance to many other nonprofit Illinois corporations which hold annual meetings outside the state of Illinois. Had the earlier Appellate Court decision been sustained, all acts of such associations at meetings held outside the state would necessarily have been illegal and void.

All questions so long litigated in these cases have now been finally set at rest and in favor of the Association. The by-laws are declared to be in conformity with the Illinois laws; the methods of electing Delegates and Trustees are approved as lawful; and the holding of annual meetings for the election of Trustees and the doing of all other business of the Association required to be done under the by-laws at such annual meetings are approved as being in strict conformity with the laws of Illinois.

Addenda to Trustees' Reports

Appended to this report will be found the reports of the Treasurer and Auditors, which speak for themselves. This year, it will be noticed, for the first time in four years, the showing is very satisfactory. This is in part owing to an increased income from advertising, but in part also to the curtailment of some of the Association's work, especially that of the Council on Health and Public Instruction.

The Board of Trustees invested $17,000 in the first Liberty Loan and $23,000 in the second. The option which the first issue of these bonds provided was taken advantage of, namely: they were exchanged for the second issue. Hence the Association has $40,000 of the second Liberty Loan, 4 per cent. bonds. The Board also invested $25,000 in the third Liberty Loan, 4.25 per cent. bonds. Thus it has a total of $65,000 invested in these bonds.

Death of Dr. McKnight

It is with sincere regret, and with the feeling of great loss, that we record the death of Dr. Edward J. McKnight, a member of the Board of Trustees. Dr. McKnight died at his home, in Hartford, Conn., on Christmas Day last, from angina pectoris. While he had been a member of the Board of Trustees only a short time, he had endeared himself to each of the members of the Board. Few men in the medical profession were more highly regarded than he, not alone because of his personalities and his delightful character, but also because he was an earnest, conscientious worker, with a humanitarian interest in his fellow men such as few possess.

War Work

A word as to the part the Association has been taking in the war medical work. In certain quarters there seems to be an idea that the Association has not made use of its opportunities or rendered to the government the service of which it was capable. War was declared April 6, 1917. The Journal for April 7 contained four editorials in which it was stated that war was certain. These editorials emphasized the needs of the Army and of the Navy for medical officers, and called on the medical profession to be ready to respond. The following week it published the facts relative to the number of graduates available from medical colleges, and emphasized the importance of maintaining the supply of physicians through the medical schools. In the issue for April 21 it issued a call to the profession of the United States, through the county societies, to supply the Army with medical officers. In that issue were printed 65,000 blank forms for making application for commission in the Medical Corps, and also in the Reserve Corps, and the announcement was made that the Association was prepared to send pamphlets, circulars and other information regarding the medical service of the Army and of the Navy. In addition to other information regarding the Reserve Corps, The Journal on April 28 published the first list of medical examining boards. On May 26 it again published application blanks—this time 67,000. From this time The Journal carried on a propaganda to build up the Reserve Corps, and in other ways to cooperate with the Surgeon-General's Office of both the Army and the Navy.

In connection with this work there naturally has been a large amount of correspondence. Since the beginning of the war the Association officers have answered, both by letter and by publication, thousands of questions relative to the service, thus relieving the offices of the Surgeons-General of this burden. Besides the application forms contained in The Journal (132,000), the Association has printed and sent out over 60,000 additional forms, or a total of nearly 200,000.

In May, 1917, a proposition was submitted to the Surgeon-General providing for a personal appeal to all physicians under 55 years of age. The plan was endorsed by the Surgeon-General, and Major J. R. McKnight of the Medical Corps was assigned to The Journal office to represent the Surgeon-General and to supervise the work. By detailing an officer for this work, the Surgeon-General made it possible to use franked envelopes and so saved the Association postage charges. The work was begun on May 28, and completed about the end of October. The Association, in addition to supplying the biographical data from its files and records, did the necessary printing connected with the work and furnished other facilities. However, the work was conducted ostensibly by the Central Division of the War Department, in Chicago, which means that the Association was unknown in the work.

The proposition as outlined, and as carried out, required the sending of a circular letter to every physician under 55 years of age. This letter extended an invitation to the one addressed to apply for commission in the Medical Reserve Corps, and was signed by Major McKnight, representing the Medical Corps. A card was enclosed—with a return franked envelope—on which the recipient was asked to give certain information regarding himself, his social conditions, and whether he would apply for commission at that time, or later—in the latter case when. An application blank and all the information necessary, including a list of examining boards, also was enclosed. To those physicians who did not answer, a second letter was addressed. All told—including the first letter and the follow-up—68,597 letters were sent out; and up to the time Major McKnight was relieved, returns had been received from 34,479 physicians. These replies are still coming in.

In his final report to the Surgeon-General, Major McKnight said:

> "In following this work and noting the number of applicants for commissions in the Medical Reserve Corps, we have seen a marked increase in these applicants reported from the different states immediately following the mailing of letters to the physicians of those states. This increase was noted to follow the mailing of both the first and second letter.
>
> "This work, which has been conducted in connection with the American Medical Association and in cooperation with Major Simmons, will be completed in a few days, with the exception of the delayed replies and certain letters of inquiry on subjects related to the Medical Reserve Corps. . . .
>
> "The American Medical Association have not only placed their files at our disposal for this work, but have rearranged their card system from time to time for our convenience, have furnished all materials other than the franked envelopes, have done all the printing and rendered every possible assistance in a most admirable manner."

In addition to this effort to increase the Reserve Corps, the Association's plant has printed a large amount of material without cost to the government. In a word, from the beginning of the war all the facilities of the Association, including its biographical information, its printing plant—everything—have been at the disposal of the Surgeon-General's Office, and every aid possible was rendered him.

As regards this point, the following letters from Surgeon-General Gorgas, dated February 22, bear witness. The first is addressed to the chairman of the Board of Trustees; the second, to the Secretary of the Association.

> *Dear Doctor McDavitt:*—In answer to your letter dated Feb. 14, 1917, I am very glad to acknowledge the great service which the American Medical Association has given, with and without solicitation, to me personally and to the Office of the Surgeon-General, in the solution of the important problems of preparedness for war and of the medical and surgical care of our boys in training camp and field by the Medical Department of the Army.
>
> Through the officers, The Journal and educational propaganda distributed by the American Medical Association, we have secured thousands of officers of the Medical Reserve Corps. The Office of the Surgeon-General and the Medical Department of the Army still need your aid and support.
>
> Permit me to thank you and through you the other trustees and officers of the Association for the valuable help already rendered and for the acceptable offer of a continued life service.

> *Dear Doctor Craig:*—It gratifies and affords me pleasure to acknowledge the great services rendered by the American Medical Association, to me personally and to the Office of the Surgeon-General, in organizing the Medical Department of the Army for the efficient care of our soldiers in training camp and field.
>
> Since April, 1917, the Board of Trustees, the officers at the Chicago headquarters, The Journal and all the machinery of the American Medical Association have been important and distinctive factors through which many thousands of physicians have been influenced to apply for commissions in the Medical Reserve Corps; medical officers have received valuable instruction by means of special articles printed in The Journal and also through literature distributed in pamphlet form from the office; and in other ways too great to enumerate here.
>
> The spirit of service expressed by the officers and members of the American Medical Association in so many helpful ways, in the work of preparation for war and for actual surgical and medical care of our soldiers in war, evidences a patriotism and devotion to country which is a credit to the American medical profession.
>
> I accept and thank you and through you the other officers of the Association for the offer to continue the same services of the Association to the Medical Department of the Army as long as may be.

On October 13, on invitation of the Provost Marshal-General's Office, the general manager held a consultation with Colonel Johnson and Major—now Colonel—Easby-Smith relative to establishing medical advisory boards in connection with the carrying out of the selective service regulations. Supplementary to this conference the following letter was received from the Provost Marshal-General:

WAR DEPARTMENT
Office of the Provost Marshal-General
Washington, D. C., Oct. 13, 1917.

Dr. G. H. Simmons,
Cosmos Club,
Washington, D. C.

My Dear Dr. Simmons:

There is, in course of preparation, new regulations governing the draft. These new regulations put into effect a plan built on principles that constitute a radical departure from anything that has been done before. In brief, it is proposed to inquire into the economic, family, and industrial relations of every person liable to military service. This is to be done by means of an exhaustive questionnaire which every registrant is required to submit to his Local Board. On receipt of the questionnaires of all registrants, the Local Board will proceed to classify all registrants in five classes, arranged in the order of their availability for military service. Classes two, three, four and five are, for all substantial purposes, temporarily discharged from the draft. Class one, alone, is immediately available for military service. Class one is composed largely of single men, and those whose relation to industry and agriculture is such that they can be taken without disturbing the economic interests of the nation.

The question of determining the physical fitness of registrants is not the least of our difficulties. In the proposed scheme it would be futile and unwise to examine those registrants who are in deferred classes. Our problem, then, is to provide immediately for the physical examination of Class one.

Under the plan for physical examination in effect for the first draft, an examining physician attached to a Local Board examined registrants before the list had been culled by exemption and discharge. If the examination resulted in a finding of physical disqualification, the registrant was reexamined by another physician. If both physicians found him disqualified, he was ordinarily discharged from draft.

This system left much to be desired. Examinations were made most hurriedly in the absence of proper apparatus. Sometimes enormous personal pressure was brought to bear on the discretion of the physican, and while no single case of improper conduct has arisen, it is not in the nature of things that, in the close relation between local physicians and their clientele, impartial consideration was not in some instances clouded. The system is not fair to the examining physician, nor to registrants, nor to the government.

It is proposed to cure this fault. It is planned to establish Medical Advisory Boards, not necessarily integrated with the territorial jurisdiction of either Local or District Boards but having headquarters with sufficient apparatus and conveniences so located as to be accessible to Boards in the portion of the state in which Advisory Boards are situated. Any case in which the local examining physician has held the registrant disqualified for service (unless the disqualification is obvious) or in which the local physician is in doubt, or in which the registrant feels aggrieved by the decision of the local physician, or where the Local Board or the Government Appeals Agent desires to appeal the findings of the local physician, is to be sent to the Medical Advisory Board for an exhaustive reexamination on which the Local Board can proceed to a final determination.

We are going to strive to give this great sifting and classification of registrants definition as a National effort in the accomplishment of which we hope to have the President call upon every citizen to assist according to his qualifications and talents. Our problem as to the Medical Advisory Boards is, I think, one of organization. The system of Advisory Boards must, if it is to be effective and if it is to be given an official status, be 100 per cent. perfect. In order to accomplish this it is necessary to have at each state headquarters some person, I think a physician, who will be responsible for the prompt, scientific and efficient organization of the state. His problem will be to consider the transportation difficulties, to locate an Advisory Board in places within his state where there are proper apparatus and conveniences, to select and to recommend to the governor, or it may be to the President, the personnel of each of such Boards. In short, he must envision his state as a system, and must create the working boards of that system. It has been suggested that a physician in the Medical Reserve Corps in each state should be called to active service, given an official status in supervision of Medical Advisory Boards, and possibly of local examining physicians within the state. I like this. I think it is practicable. I am inclined to believe that it is the only way to obtain a responsible person in each state to whom we can look for efficient organization.

We need the active and vigorous cooperation of the American Medical Association. We need the promptest and most thorough action in this regard. Will you not call together a sufficient number of your executive council to authorize this cooperation by the Association, and to consider a definite and concrete proposition which can be presented here, and upon which we can act?

Yours very truly,
Hugh S. Johnson,
Lieutenant-Colonel, Judge Advocate,
Executive Officer.

In response to this, the Board of Trustees met in special session on October 19. It officially offered the cooperation of the Association and its officers to the Provost Marshal-General in the proposed formation of these medical advisory boards. A committee was appointed, to be known as the War Committee of the Association, composed of: Dr. Hubert Work, chairman of the House of Delegates, as *chairman;* Dr. E. J. McKnight, a member of the Board of Trustees; and Dr. M. L. Harris, Secretary of the Board of Trustees. On the death of Dr. McKnight, Dr. A. R. Mitchell of Lincoln, Neb., a member of the Board of Trustees, was appointed on the War Committee; and the President and Secretary of the Association and the Editor of The Journal, *ex-officio,* were made members of the committee. This committee will make a report covering its work.

Respectfully submitted,

Thomas McDavitt, Chairman,	Oscar Dowling,
M. L. Harris, Secretary,	Philip Marvel,
Wendell C. Phillips,	W. T. Sarles,
A. R. Mitchell,	H. Bert Ellis.

Addenda to Trustees' Report

SUBSCRIPTION DEPARTMENT

The regular weekly issue of The Journal of the American Medical Association, from January 1, 1917, to December 1, 1917, inclusive (52 issues), was as follows:

January 6	66,842	July 7	65,457
January 13	66,412	July 14	65,606
January 20	64,531	July 21	65,564

PERCENTAGE OF PHYSICIANS RECEIVING THE JOURNAL

This table gives the number of physicians (based on the fifth edition of the American Medical Directory) in the United States, the number receiving The Journal, and the approximate percentage in each state. Copies to physicians in the United States Army, United States Navy, United States Public Health Service, etc., are not included.

State	Number Receiving Journal	Physicians in State 5th A. M. Dir.	Approx. Percentage 5th A. M. Dir.
Alabama	630	2,569	25
Arizona	206	307	67
Arkansas	608	2,637	23
California	2,917	5,687	51
Colorado	814	1,733	47
Connecticut	998	1,678	54
Delaware	92	261	35
District of Columbia	593	1,482	40
Florida	400	1,321	30
Georgia	1,092	3,421	32
Idaho	212	439	48
Illinois	5,902	10,648	55
Indiana	1,734	4,872	36
Iowa	1,786	3,751	48
Kansas	1,322	2,683	49
Kentucky	1,042	3,584	29
Louisiana	665	2,060	32
Maine	461	1,205	38
Maryland	1,020	2,292	45
Massachusetts	3,194	5,869	54
Michigan	2,294	4,360	53
Minnesota	1,668	2,447	68
Mississippi	416	2,048	20
Missouri	2,085	6,399	31

South Carolina	517	1,399	37
South Dakota	371	676	56
Tennessee	984	3,457	28
Texas	1,987	6,240	32
Utah	284	465	63
Vermont	240	668	36
Virginia	963	2,547	38
Washington	837	1,695	49
West Virginia	769	1,729	45
Wisconsin	1,599	2,803	56
Wyoming	143	251	57

The following table shows the number of Fellows and subscribers on The Journal mailing list, for each year, commencing with 1900:

Year	Fellows	Subscribers
January 1, 1900	8,445	4,633
January 1, 1901	9,841	8,339
January 1, 1902	11,107	10,795
January 1, 1903	12,553	12,378
January 1, 1904	13,899	14,674
January 1, 1905	17,570	15,698
January 1, 1906	20,826	17,669
January 1, 1907	26,255	20,166
January 1, 1908	29,382	20,880
January 1, 1909	31,999	18,983
January 1, 1910	33,032	19,832
January 1, 1911	33,540	20,504
January 1, 1912	33,250	21,620
January 1, 1913	36,082	19,863
January 1, 1914	39,518	19,751
January 1, 1915	41,254	20,430
January 1, 1916	41,938	22,921
January 1, 1917	42,744	22,156
January 1, 1918	43,420	23,117

During 1917 there were 2,943 names transferred from Subscription Department and 158 from *The Archives of Internal Medicine* and *The American Journal of Diseases of Children* to the Fellowship Department; also 120 from *The Archives* and the *Children's Journal* mailing list to that of The Journal A. M. A., and 56 from The Journal list to *The Archives* and *The American Journal of Diseases of Children.*

The total number of transfers to Fellowship was 3,101.

There were 394 discontinued as Fellows, but continued as subscribers.

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association for the year ended December 31, 1917.

ASSOCIATION RESERVE FUND

Reserve Fund as at December 31, 1916		$120,648.95
Receipts for the year ended December 31, 1917:		
Investments	$ 40,000.00	
Interest	5,587.32	
		45,587.32
Reserve Fund as at December 31, 1917		$166,236.27

TREASURER'S GENERAL ACCOUNT

Balance as at December 31, 1916		$ 3.52
Receipts for the year ended December 31, 1917:		
Transfer from General Working Fund	$ 40,000.00	
Interest on Bank Balances	276.41	
		40,276.41
		$ 40,279.93
Disbursements for the year ended December 31, 1917:		
Transferred to Reserve Fund		$ 40,023.31
Balance as at December 31, 1917		$ 256.62

DAVIS MEMORIAL FUND

Balance as at December 31, 1916	$ 3,440.71
Interest received for the year ended December 31, 1917	103.98
Balance as at December 31, 1917	$ 3,544.69

AUDITORS' REPORT

Chicago, Ill., Jan. 24, 1918.

The Board of Trustees of the
American Medical Association, Chicago, Illinois.

Gentlemen:

In accordance with your instructions, we have audited the accounts of the American Medical Association for the year ended December 31, 1917, and now submit our report thereon.

SURPLUS ACCOUNT

The surplus at the beginning of the year amounted to $382,135.69, and the surplus at the end of the year amounted to $423,433.87, an increase of $41,298.18, which is accounted for as follows:

Net Gain on Operations	$77,303.56
Transfer from Liability Insurance Reserve Fund	4,017.93
	$81,321.49
Less Transfer to Reserve Fund	40,023.31
Net Increase in Surplus	$41,298.18

The net increase in surplus is spread over the assets and liabilities as follows:

Increase in Assets:		
Property and Equipment		$ 1,174.11
Current and Working Assets		43,982.05
		$ 45,156.16
Less Decrease in Prepaid Expenses		489.96
		$ 44,666.20
Less Increase in Liabilities:		
Accounts Payable	$ 4,907.29	
Less Decrease in Advance Payments on Publications	1,539.27	
		3,368.02
Net Increase in Surplus, as above		$ 41,298.18

FINANCIAL POSITION

The financial position of the Association as at December 31, 1917, is shown in the following statement:

Balance Sheet as at December 31, 1917

Assets:			
Property and Equipment at Cost, less Depreciation:			
Real Estate and Buildings			$240,264.09
Machinery			42,875.95
Type and Metals			7,853.72
Furniture and Equipment			13,518.00
Chemical Laboratory			1,564.91
Library			1,278.04
			$307,354.71
Reserve Fund *Investment*			166,236.27
Current and Working Assets:			
Inventory of Materials, Supplies and Work in *Process*		$41,720.59	
Accounts Receivable:			
Advertising	$26,351.58		
Cooperative Medical Advertising Bureau	6,548.47		
Reprints	2,904.45		
Miscellaneous	3,778.62		
		39,583.12	
Notes Receivable		437.74	
Directory, 6th Edition (Labor and Material)		20,252.38	
Cash in Bank and on Hand		23,107.88	
Office Fund		50.00	
			125,151.71
Prepaid Insurance			1,244.18
Total			$599,986.87

LIABILITIES:		
Accounts Payable:		
Cooperative Medical Advertising Bureau	$ 4,412.62	
Sundry	3,210.37	
	$ 7,622.99	
Advance Payments on Publications	2,693.74	
Association Reserve Fund	166,236.27	
Surplus	423,433.87	
Total	$599,986.87	

The balance sheet submitted, in our opinion, correctly reflects the financial position of the Association as at December 31, 1917, subject to provision for accrued interest, taxes and "Journal" subscriptions paid in advance, less subscriptions and memberships due and unpaid.

We examined the securities representing the investment of the Association Reserve Fund, and we found them in order.

We verified the cash on hand by actual count and the cash in bank by certificates obtained from the various depositories. The following is a statement of the cash balances:

Continental and Commercial National Bank	$ 22,546.77
First Trust and Savings Bank (Treasurer's Account)	256.62
Cash on Hand	304.49
Cash Fund	50.00
Total	$ 23,157.88

OPERATIONS

The operations of the Association for the year ended December 31, 1917, are shown in the following statements:

INCOME AND PROFIT AND LOSS ACCOUNT FOR THE YEAR ENDED DECEMBER 31, 1917

JOURNAL:			
INCOME:			
Fellowship Dues		$ 43,569.00

The audit embraced an exhaustive test of the various sources of income and the verification of the cash disbursements with proper vouchers on file.

We are pleased to report that we found the accounting records to have been kept in the usual good order, and that every facility was afforded us for the proper conduct of the audit.

Yours truly,
MARWICK, MITCHELL, PEAT & CO.,
Chartered Accountants.

Report of the Judicial Council

Dr. Alexander Lambert, New York, *Chairman*, presented the following report of the Judicial Council. This report was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

To the Members of the House of Delegates of the American Medical Association:

There has been presented to the Judicial Council by the president of the University of Minnesota the following contract asking for an opinion whether or not the adoption of this agreement would be contrary to the standards and code of medical ethics of the American Medical Association.

This Agreement made in triplicate this day of January, A. D. 1918, by and between E. C. Kendall, party of the first part, William J. Mayo and Charles H. Mayo, parties of the second part, and University of Minnesota, party of the third part, witnesseth:

WHEREAS, The party of the first part, working under the auspices and in the employment of the parties of the second part, has discovered an agent for the treatment of disease, which has been by him designated "Thyroxin" and has applied for letters patent of the United States thereon, and intends hereafter to apply for letters patent in various foreign countries; and

WHEREAS, It is the desire of all the parties hereto that said substance shall not be commercially exploited for private gain, and that it shall be manufactured and sold with the expressed object of making it available for use in such a way as to do the greatest amount of good for the greatest numbers, and that the same may be dispensed free of charge to patients unable to pay for it;

NOW, THEREFORE, To carry said objects into effect, it is mutually agreed by and between the parties hereto, that the said party of the first part does hereby give, grant and convey unto the said party of the third part the said preparation and trade name and all and every of his rights as a discoverer thereof, and in order further to vest title thereto in said party of the third part, does hereby agree to make, execute, acknowledge and deliver unto said party of the third part so soon as any patent or patents shall be granted unto him, all deeds, assignments and other conveyances necessary to transfer to said party of the third part any and all patents, whether domestic or foreign, which may be hereafter issued to said party of the first part in connection with said discovery, and any and all patents, foreign or domestic, concerning the production of the active constituent of the thyroid, and does hereby further give, grant and convey all his right, title and interest in and to the trade-name hereinbefore set forth.

The said parties of the second part do hereby also give, grant and convey unto said party of the third part all their right, title and interest in and to said preparation and said trade-name.

It is further mutually understood and agreed by and between the parties hereto that said gift is made by said parties of the first and second part, and accepted by said party of the third part, upon the following conditions, to-wit:

1. That the said party of the third part shall cause said preparation or any improvement or alteration thereof to be manufactured and placed upon the market for such monetary return as shall be consistent with making it available for use in such a way as to do the greatest good and render the use thereof most generally available for the benefit of the human race, and may cause the same, when so manufactured, to be distributed without charge to persons who cannot afford to pay for it. The party of the third part shall have the right to grant subsidiary rights and privileges thereunder, either upon royalties or otherwise. The party of the third part agrees that it will use reasonable diligence to utilize said rights as aforesaid, but it is particularly agreed, and the party of the third part accepts said gift only upon the condition, that it shall be sole judge as to what is reasonable diligence in the respect mentioned, and that it shall not be pecuniarily or legally responsible for any want of diligence in such respect unless the same be in bad faith or the equivalent of bad faith, and that in view of the fact that the party of the third part is a public corporation all of whose funds are derived from the public, or held upon trust, the party of the third part shall not be pecuniarily or legally liable under any circumstances whatsoever except to the extent of such rights or the proceeds, profits or returns in its hands at the time of recovery against it.

2. That said party of the third part may annually pay said party of the first part such sums as the party of the third part may deem to be equitable but in no event to exceed in any year 10 per cent. of the net proceeds received by the party of the third part from the sale of the substance in that year; and in the event of the death of said party of the first part may annually pay such sum as said party of the third part may deem equitable to the wife or heirs at law of said party of the first part not to exceed in any year 10 per cent. of the net proceeds received by the party of the third part from the sale of the substance in that year; providing that all such payment to the heirs at law of the party of the first part shall cease when the youngest child of the said party of the first part shall become 21 years of age.

3. That the money which shall have been derived from the sale of this substance shall become part of the funds of the "Mayo Foundation for Medical Education and Research," and except as hereinbefore provided, shall be expended for research into the physical and chemical properties and mode of action particularly of the substance now known as Hormones in the animal organism, and generally, into the physical and chemical properties and mode of action of the substances now known as Enzymes.

4. The expenditure of the funds so derived shall be under the direction of an Executive Committee consisting of three men engaged primarily and directly in research work, which said committee shall be appointed by said party of the third part. Members of the said Committee shall each be appointed for a term of six years and shall be eligible for reappointment. The first appointees, however, shall serve as designated in their appointments for terms of two, four and six years respectively. Any member of said committee may be removed upon recommendation of two-thirds thereof and upon a vote, in favor of such removal, of the majority of the Regents of said party of the third part.

5. Should it at any time be decided, by the vote of two-thirds of said Executive Committee, concurred in by the vote of a majority of said Board of Regents, that it shall no longer be desirable to continue such research work along the lines hereinbefore set forth, and that the same shall be permanently abandoned, then, and in that event, all of the funds then on hand arising from the sale of said preparation, and all funds which may thereafter arise therefrom, shall become and be part of the funds of said "Mayo Foundation for Medical Education and Research" and be administered in accordance with the contract relating thereto heretofore entered into by the said parties of the second and third part.

In Testimony Whereof, The said parties of the first and second part have hereunto set their hands and seals; and the said party of the third part has caused this instrument to be executed by its proper officers and its Corporate Seal to be hereunto affixed the day and year first above written.

This contract is evidently a bona fide agreement proposed to be entered upon between a chemist, two members in good standing in the American Medical Association and a state university conducting a high grade and ethical medical school, the members of the medical faculty of which are members of the American Medical Association.

The Judicial Council must therefore assume and does assume that its official opinion is honestly sought and honestly desired. This is therefore no mere hypothetical question asking for an expression of *opinion which* cannot be considered by the Judicial Council according to its Rules of Procedure (Rule 6, Rules of Procedure and Rules 1 and 2, Methods of Procedure).

On the contrary, this is an agreement which the Judicial Council has discretionary powers to consider since "the Judicial Council may at its discretion investigate general professional conditions and all matters pertaining to the relations of physicians to one another and to the public and shall make such recommendations to the House of Delegates and to the constituent associations as it deems necessary" (Chapter VII, Section 4, last section of By-Laws). The relations of physicians to one another and to the public are questions raised in this agreement and its consideration by the Judicial Council is a proper one whether this be asked for by the public as here represented in the president of a state university, a public institution, or whether this request has come to the Judicial Council at the instance of the physicians who are parties to the agreement. There are no set rules for the exercise of the discretionary power of investigation by the Judicial Council, it alone can decide whether or not such questions as are under discussion shall come before it and how they shall be presented. This agreement under consideration is therefore one properly presented to the Council and over which it has original jurisdiction and which in its discretion it may consider and upon which it may duly make recommendations to the House of Delegates.

This agreement states that E. C. Kendall, an employee, working under the auspices of Drs. William J. and Charles H. Mayo has discovered an agent "Thyroxin" for the treatment of disease and has applied for letters patent of the United States thereon and intends to apply for letters patent in foreign countries. E. C. Kendall agrees to give all patent rights and titles and trade name to the University of Minnesota and the Drs. Mayo agree to give all their rights, titles, etc., in this same medical discovery, to the same university. The university agrees to do all the selling and exploiting of the medical discovery and agrees to give 10 per cent. of the returns to E. C. Kendall and to cover in to the present Mayo foundation fund of the university the remainder and use them for scientific investigations and for the furtherance of scientific study.

From time immemorial it has been unethical for members of the American medical profession to patent medical discoveries and use the proceeds for gain. The Judicial Council is of the opinion that the same standard which applies to individuals must also be conformed to by partnership companies and corporations of which a physician is a member. In other words, a physician cannot escape personal responsibility by making a group of which he is one the agent that acts in a manner in which the physician himself would not act. In recent years, it has been held to be ethical and the Judicial Council has so considered it that any physician could patent a medical discovery and give the patent rights and titles to the trustees of some medical society to hold and not use or exploit for commercial gain. This has been done to prevent the exploitation of the profession and public for personal gain on medical discoveries. The American medical profession has always held it to be more honorable and more in conformity to its high ethical ideals and standards to refuse to burden any medical discovery with the added tax *imposed by patents* and has universally considered that the greatest good to the greatest number could best be obtained by foregoing the patenting and commercial exploitation of medical discoveries for gain. It would not be unethical for the Drs. Mayo to have E. C. Kendall, their employee, and working under their auspices, patent his medical discovery and give these letters patent and patent rights and titles to some medical society to hold and not use for gain. *But it would* be unethical to convey the rights of this patented medicine to any third party to use and commercially to exploit for gain, no matter to what honorable use the commercial proceeds may be put. The ethics of patenting a medical discovery are not overshadowed or affected by the use to which the returns from the sale of the patented medicine may be put.

It is therefore the opinion of the Judicial Council that it would be unethical to consummate this agreement. It would be unethical for the University of Minnesota because it would be unethical for the members of its medical faculty to agree to accept a patent and patent rights which the university proposed to use for commercial gain, just as much so as it would be unethical for these medical *men individually* to patent or accept a patent of a medical discovery and exploit it for personal gain. It would be unethical for the Drs. Mayo on their part to consummate this agreement for they would be patenting a medical discovery and using the commercial proceeds therefrom to increase a fund given by them to the university and it would still be unethical for them to patent the medical discovery and turn over to a third party the commercial exploitation thereof.

It will be recalled that at the Detroit session in 1916, the House of Delegates adopted the following resolution:

Resolved, That the Board of Trustees of the American Medical Association may accept, at their discretion, to hold, to control and to manage, as trustees for the benefit of the people and the protection of the medical profession, such patents on chemicals, remedial or diagnostic substances, medical or surgical instruments or appliances, or anything whatsoever that may be used in the treatment of disease or infirmity and for which a patent may be issued, as the patentee may desire to convey to the American Medical Association for the public protection and benefit; provided, that the patentee shall surrender all claim to remuneration from the royalties or otherwise on such patent or patents to the Board of Trustees of the American Medical Association, which Board of Trustees shall not exact from the manufacturer or producer under such patent or patents, any royalty or other pecuniary compensation or return therefrom, unless, in the judgment of the Board of Trustees, the exaction of such royalty shall appear to be wise and just and for the better protection of the public or the medical profession.

This resolution was substituted for a previous resolution relative to this matter, adopted by the House in 1914, which was as follows:

Resolved, That the Board of Trustees of the American Medical Association shall be permitted to accept, at their discretion, patents for medical and surgical instruments and appliances, as trustees, for the benefit of the profession and the public; provided, that neither the American Medical Association nor the patentee shall receive remuneration from these patents.

According to the resolution now in force, the Board of Trustees, at its discretion, may exact such royalties as "shall appear to be wise and just and for the better protection of the public or the medical profession."

The Judicial Council recommends that the resolution adopted in 1916 be rescinded and that the resolution adopted in 1914 be reaffirmed. It will be noted that the resolution of 1914 empowers the Board of Trustees to protect the medical profession and the public by accepting as trustees patents, provided that neither the Association, nor the patentee receive a remuneration from these patents. This is in accord with the principles of Medical Ethics which states, "It is unprofessional to receive remuneration from patents for surgical instruments or medicine" (Principles of Medical Ethics, Chap. II, Art. 1, Sec. 5).

Respectfully submitted,

Alexander Lambert, Chairman,
A. B. Cooke,
H. A. Black,
Randolph Winslow,
A. R. Craig, Secretary.

Report of the Council on Health and Public Instruction

Dr. Frank Billings, Chairman, read the report of the Council on Health and Public Instruction, which was referred to the Reference Committee on Legislation and Political Action.

The report follows:

To the Members of the House of Delegates of the American Medical Association:

The work of the Council on Health and Public Instruction, like all of our other national activities, has been greatly reduced during the past year on account of war conditions. This is due not only to the absorbing interest of the public mind in problems directly connected with the conduct of the war, but also to the fact that the entire membership of the Council has been actively engaged in public service. Almost immediately after the New York Session in 1917, Dr. Frank Billings, the Chairman of the Council, was sent to Russia as chairman of a special commission. On his return after four months' absence, he was ordered to active service as an officer of the Medical Reserve Corps, first as aide on the staff of the governor of Illinois, then as special adviser to the Provost Marshal-General's office in Washington, and later to the Surgeon-General's Office for the formulation of plans for the care of the crippled and injured soldiers after the war. Dr. Walter B. Cannon of Boston went to France as an officer in the Medical Reserve Corps attached to the Harvard Base Hospital Unit, one of the first medical organizations to be sent abroad. Dr. Wilton Board has been on duty in the Medical Reserve Corps at the base hospital, Camp Zachary Taylor, near Louisville, Ky. Drs. Henry M. Bracken and Watson S. Rankin, the two remaining members of the Council, have been on constant duty as secretaries and executive officers of the boards of health of their respective states and have been cooperating with the federal government in guarding public health interests. The Secretary of the Council was ordered into active service early in August of 1917 and has been on continuous duty as an officer in the Medical Reserve Corps since that time.

Necessarily with all five members of the Council and the Secretary in service, the activities of the Council during the year have been limited to routine work. The Council office at the headquarters building in Chicago has been maintained and operated continuously, and routine correspondence and the filling of orders for educational pamphlets, charts, posters, etc., have been carried on. Owing to existing conditions and the absorption of the public mind in other topics, it has not been considered advisable to undertake any new activities or the development of any new lines of work for the present. As soon as the war is over, the Council will resume its function of public education and stimulation of interest in health topics, public health legislation, etc., with the expectation of finding a public sentiment in favor of organized, concerted and constructive public health work resulting from the educational influence of our military activities greater than has heretofore been possible. The demonstration on a large scale of the effectiveness of modern preventive medicine which has been going on in our camps cannot fail to have a marked influence on public sentiment. The entrance into the service of nearly 20,000 physicians as officers of the Medical Reserve Corps will insure in the future a degree of discipline and cooperation in the medical profession that has heretofore been impossible. The Council confidently anticipates a degree of public interest and of constructive effort along public health lines following the war such as has never before been possible in this country. To meet this situation, it is more than ever necessary that the organized medical profession should be represented in this field by a permanent board capable of carrying on a definite constructive policy, looking toward the development of the largest amount of cooperation between the organized medical profession on the one hand and the general public on the other.

The following tables show the work done by the Council during the past year in the distribution of educational material:

TABLE 1.—NUMBER AND CHARACTER OF PAMPHLETS PRINTED AND DISTRIBUTED, MAY 1, 1917, TO APRIL 1, 1918

Conservation of Vision, Pamphlet III. "Wearing Glasses"		1,000
Conservation of Vision, Pamphlet VIII. "Lenses and Refraction"		1,000
Conservation of Vision, Pamphlet XI. "Infant Blindness, or Ophthalmia Neonatorum"		500
Sex Hygiene. "Chums"		500
Sex Hygiene. "Life Problems"		1,000

REPORTS OF SUBCOMMITTEES OF THE COUNCIL ON HEALTH AND PUBLIC INSTRUCTION

COMMITTEE ON COOPERATION WITH THE NATIONAL EDUCATION ASSOCIATION

To the Council on Health and Public Instruction:

Your committee charged with coordinating the work of the American Medical Association with that of the National Education Association reports by submitting the following memorandum of a meeting of the Joint Committee at Atlantic City:

1. An increasing number of letters is being received by the chairman of the Joint Committee for the committee reports and for information regarding various aspects of our committee program.

2. Ten thousand copies were printed of our committee third report, entitled "Health Charts." About 8,000 copies of this report have been distributed.

3. A few days before the meeting of the Joint Health Committee at Atlantic City, the chairman of the Joint Committee received a telegram from Mrs. Ira Couch Wood, Director of the Elizabeth McCormick Memorial Fund of Chicago, stating that the trustees of that fund had taken action making available $2,000 for the printing of our health chart sets. Mrs. Wood has suggested or asked, on behalf of the Elizabeth McCormick Memorial Fund, that three charts on Open-Air School and Open-Window Rooms should be printed and distributed with the Health Charts sets of the committee. The additional cost involved in this will be met by the Elizabeth McCormick Memorial Fund.

4. The Joint Committee approved the plan proposed by its chairman for the printing of a fourth pamphlet report to be called "Health Improvement in Rural Schools." This pamphlet report, not to exceed fifty pages, will give information regarding the best health work which is being carried out at the present time in the rural schools of the country. The material for this report is being provided by the generous responses which the chairman has received in answer to 1,072 questionnaires and letters which have been sent out to state superintendents of education, health officers, rural school supervisors, county superintendents, and others who are acquainted with the work in this field.

The concensus of opinion at the meeting of the Joint Committee in Atlantic City expressed itself in favor of the extension of the committee program for the consideration of health problems of the city schools as well as those in the country.

A brief summary of certain activities undertaken under the personal direction of the chairman of the Committee of the Council on Health and Public Instruction is appended:

In southern Colorado, we have kept up the protection of the teeth, eyes and health of the schoolchildren in the rural schools.

In the coal camps, an eye, ear, nose and throat specialist has been examining and treating the schoolchildren of these schools. A dentist and a special nurse are at work among the schoolchildren of the camps, treating and repairing teeth and teaching mouth hygiene.

At these camps, visiting nurses are working who devote their entire time to teaching hygiene and sanitation in the homes of the miners. This work is having a decidedly beneficial effect on the health of the community and does much to improve the schools. Owing to the importance and timeliness of first aid work, we are continuing classes in camps and schools.

The importance of architecture of schoolhouses is not being lost sight of—and whenever possible we speak of the importance of properly constructed schoolhouses, giving the unit schoolhouse as an illustration, with its faultless lighting and ventilation.

Respectfully submitted.

R. W. CORWIN, Chairman.

REPORT OF COMMITTEE ON WOMEN'S AND CHILDREN'S WELFARE

To the Council on Health and Public Instruction:

This last year, the work of our committee has been largely advisory and cooperative, instead of initiative. This has been necessary because of the lack of appropriation and the absence of the majority of the members of the Council, especially the absence of its secretary, Dr. Green. One new feature of the work has been an effort to get the various state fair boards to make provisions for a department of child welfare. The effort has met with a gracious response in all instances and a number have already established permanent departments. At one state fair, alone, 500 babies were measured and scored. A very fair and promising proportion of these were self-competing—that is, children who had entered in 1916, failed to score high because of remediable defects, were worked on according to advice received at the conference, and returned in 1917 to measure their improvement against that of the previous year.

As we have said, the bulk of our work has been cooperative. As chairman of the Child Hygiene Division of the General Federation, it has been possible to come in contact with, and help direct, the plans for child welfare in the women's clubs of the country. In this capacity, we have submitted two lines of work closely allied with the work of the American Medical Association: insistence on adequate vital statistics laws and development and furtherance of baby health conferences. The latter recommendation has necessitated the distribution of the American Medical Association Score Card, Anthropometric Table and Pamphlet No. 7, in addition to bulletins from the federal bureau, and material from the Association for the Study and Prevention of Infant Mortality.

In response to a summons from the Children's Bureau, we met in conference with child welfare workers at Washington, D. C., March 14 and 15, to discuss plans for the children's year. These plans cover three proposed drives: The measuring and weighing of all children under 5 in the United States; the establishment and increase in numbers of public health nurses; and the training of home health volunteers.

As these plans are being executed by the National Council of Defense with the assistance of the General Federation of Women's Clubs and the Parent-Teacher's Associations of the country, they offer a far-reaching field of cooperation. The American Medical Association Baby Welfare Charts, Save the Babies pamphlets and Anthropometric Tables are especially in demand. If the funds were available, and office force sufficient, an unlimited supply of material from our committee would be demanded. It is our keenest regret not to be able to meet that demand in an aggressive way, for wherever permanent stations are established there will be a demand for material and work.

The score card used for the weighing and measuring test is very simple and consequently exceedingly practical for uniform use. It is hoped that in localities where the data secured reveals the need of further investigation such investigation may be made. The Smithsonian Institution of Washington, D. C., and the Iowa Child Research Station have signified their willingness to cooperate in an advisory capacity wherever possible. In this day of reckless expenditure of adult life, we are doubly inexcusable if the rate of infant mortality is not decreased in proportion to the increased destruction of life by war. Organized effort, continuously made, and backed by adequate funds is the only solution of the problem.

Respectfully submitted.

LENNA L. MEANES, Chairman.
M. L. TURNER, Secretary.

Report of the Council on Medical Education

Dr. Horace D. Arnold, Chairman, presented the report of the Council on Medical Education, which was referred to the Reference Committee on Medical Education.

The report follows:

To the Members of the House of Delegates of the American Medical Association:

Fourteen years ago the Council on Medical Education was established and began its efforts to improve medical education in the United States. In 1904 the number of medical schools in this country exceeded the total in all the rest of the world. As to the character of its medical schools, however, this country suffered in comparison with other countries. Medical schools abroad were mainly departments of large universities, liberally financed either by govermental or private agencies. In the United States most of the medical schools were independent and not only met all expenses from student's fees but many actually derived profits from that source. In most European countries entrance requirements were the equivalent of one and a half or two years of work as measured by courses in standard colleges and universities in this country. In the United States, in 1904, only four medical schools were requiring any college work for admission and the large majority were not even requiring a four-year high school education. Medical schools of Europe were mostly supplied with full-time, salaried teachers, including some who devoted their attention to clinical subjects. In 1904, only a few medical schools in this country had any full-time teachers in charge of their laboratory subjects. Most of the medical schools in Europe as well as those of South America were connected with large teaching hospitals. In 1906, in the United States, when the first inspection of medical schools was made, only a small proportion of the medical schools had relationships with hospitals sufficiently large to supply satisfactory clinical teaching material.

Progress in Fourteen Years

During the last fourteen years the situation has been decidedly improved. Largely through the merging of two or more colleges into one in each of many instances the sum total of medical schools has been reduced to what is more nearly the normal supply for this country. Most of the medical schools at present, however, are stronger and better equipped in every way; many of them now compare favorably with the best medical schools abroad, and a score or more are in some respects superior to the very best found anywhere. The advantages in this country at present are the higher and better supervised entrance requirements; larger staffs of well qualified, full-time laboratory teachers; closer relationships with large and well conducted hospitals; and the use of the more modern methods of practical and clinical teaching. Commercialism has been practically eliminated from medical teaching and only a few seriously low grade medical schools continue to exist. Now, as shown in Chart 1, 80 per cent. of the medical schools are requiring for admission two years of collegiate work; the majority have teaching relationships with one or more hospitals in which clinical material is abundant and being used in accordance with the latest methods of teaching.

Importance of Preliminary Education

Of all the improvements enumerated, the one of greatest importance has been the increase in entrance requirements. Without a thorough preliminary education, including a training in physics, chemistry and biology, students would not be able to master the present-day medical course, and would be seriously handicapped, however well equipped the medical school might be with teachers and laboratories. It is noteworthy that the higher admission requirements were adopted voluntarily by the majority of medical schools. In this increase, as a rule, the medical schools were supported by their local state licensing boards, so that now two years of college work have been made an essential qualification for the license in thirty states. This action by the licensing boards also induced certain other medical colleges to go on the higher standard which would not do so voluntarily. Meanwhile, it is those who are interested in medical schools of the latter type who are quick to seize on any pretext to urge a retrogression in entrance requirements, and they have recently been magnifying the country's "dire need of doctors" in the present war emergency, in the hope of securing a retrogression in the entrance requirements of medical schools. As already shown, however, the two-year standard of preliminary education has brought the entrance requirements of medical schools in this country on a par with the essential preliminary qualifications in Great Britain and the other countries of Europe. With the present standards, therefore, Americans need no longer apologize when they speak of medical education in the United States.

Reforms in Medical Education and the War

It is gratifying to know that the reforms in American medical education were so nearly completed before this country was finally drawn into the world war. For the last six or seven years the majority of medical schools have not only been enforcing the higher entrance standards but have also been operating under greatly improved conditions in other respects. The majority of students graduating in the last several years, therefore, have received a medical training equal to the best obtainable anywhere. Furthermore, it is these recent graduates who, in larger proportions, have entered the government medical services and who will be responsible for the medical care of our American soldiers and sailors. It is a matter of congratulation, therefore, that those fighting for the preservation of America and American ideals will have as skilled medical care as those of the opposing armies. This could not have been said had it not been for the energetic campaign of the last fourteen years to improve medical education.

No Dearth of Physicians but an Increased Demand

The war has affected the supply of physicians, even as it has reduced the supply of those in other technical occupations. In recent years also the demand for medical graduates to fill positions as hospital interns, health officers, medical inspectors, medical teachers and other positions of responsibility has been greatly increased. This increased demand is due, not to any scarcity of medical graduates, but to the improved qualifications of those now graduating from our medical schools. In former years this demand did not exist, for the very reason that many of the graduates then turned out were not qualified, educationally or professionally, to occupy the positions now open to them. The increase in the demand has been in direct proportion to the improvements in preliminary and medical education.

Demand for Better, Not Lower, Education

Even for Army purposes the great demand is not so much for ordinary physicians or surgeons as for those of highly technical and special training. Emphatically, therefore, the present demand does not call for a lowering of educational standards, but for the maintenance of present entrance requirements (two years of college work); for further improvements in laboratory and clinical equipment and, particularly, for improved methods of teaching in all medical schools. It is only by maintaining these fair standards that the demand will be supplied, since in the better medical schools, the number of graduates has steadily increased each year for the last five years, while the number graduating each year from the lower grade colleges *has steadily decreased.*

Medical Education for Negroes

One result of the campaign for an improved medical education has been that a generous financial support has been provided for medical schools, either from state appropriations or private sources. The gifts, which at first were of a few thousands of dollars, were soon increased to hundreds of thousands and then to millions, and in recent years gifts of the larger sums have become almost commonplace. These generous gifts indicate the general recognition of the fact that a medical school needs a liberal income in addition to students' fees if it is to furnish a training in accordance with present-day medical knowledge.

In the providing of funds, however, it appears that medical schools for negro students have been largely overlooked, although their need for such support is proportionately greater than for medical schools generally. Now they not only lack this outside financial aid, but also their income from students' fees has been considerably reduced as a result of the general adoption of higher entrance requirements. For these reasons, largely, medical schools for negroes have not been able to keep pace with the rapid improvements made in other medical schools.

There are about eleven million negroes in the United States and only four negro medical schools. One of these is in Class A; two in Class B and one in Class C. The Howard University School of Medicine at Washington receives only about $5,000 each year—not nearly sufficient to meet its needs—from the United States government, and has access to the large Freedmen's Hospital which is financed by the government. The Meharry Medical College at Nashville in recent years has received a few thousands from private donations and a larger sum to build a small teaching hospital. It is much in need of funds for its further development and maintenance. Still smaller sums have been received by Leonard Medical School, the medical department of Shaw University, which gives only the first two years of the medical course. A few years ago this school discontinued the clinical courses so as to concentrate its efforts on improving the laboratory portion of the school. To show the need of these medical schools it should be stated that, at the lowest estimate, no college can properly teach modern medicine without an income of at least $25,000, in addition to students' fees. This figure should be doubled, if the college is to be even moderately well conducted. These funds are needed to provide more salaried, full-time teachers, more laboratories, more equipment, and to provide for better administration. Furthermore, in the coming requirement of an internship in a hospital as a requisite for the license, increased provision for internships will need to be made for such graduates. This means more hospitals for negroes. Although most of the northern white schools accept negro medical students into their classes, it is difficult to provide them with internships in suitable hospitals. These problems in connection with negro medical education are worthy of careful consideration. No better object could be found for generous donations at the present time than medical schools for the colored race.

Progress in Medical Licensure

Since 1904, the Council has had, as one of its regular functions, the collection and tabulation of statistics which are published in the State Board Number of the *Journal* in April of each year. These statistics have had a large influence in the improvement of both medical education and medical licensure. Four tables published this year are of particular importance and are reproduced in this report. Table 1 has been published with the statistics for each of the last five years and its influence on medical education has been profound. It is based on reports signed by officials of the various boards and shows in what states the diplomas granted by various medical colleges are not recognized as an acceptable qualification for the license. This table has been published each year in the State Board Number of the *Journal*, in the annual report to the House of Delegates and in a pamphlet published for and widely circulated among prospective medical students. Prior to the publication of this table medical students had no way of ascertaining whether or not the diplomas of the colleges they were attending would enable them to secure licenses.

TABLE 4.—ADVANCES IN STATE LICENSE REQUIREMENTS IN FOURTEEN YEARS

Requirement or Provision	States Having Provision for			States Still Having No Provision for
	1904	1918	Increase	
Preliminary Education—				
Any provision for	21	46	25	4[1]
Any standard fixed	18	44	26	6[2]
A standard four-year high school education or higher	7	44	37	6[2]
One year or more of college work	0	38[3]	38	11
Two years of college work as a minimum	0	30[3]	30	19
That all applicants be graduates of a medical college	36	49	13	0
That all applicants undergo an examination for license	45	48	3	1[4]
Requirements of practical and clinical tests in the license examinations	1	5[5]	4	43
Hospital intern year required	0	7[6]	7	42
Full authority by board to refuse recognition to low-grade colleges	14	43	29	6[7]
Boards refusing to recognize low-grade colleges*	5	37	32	11[8]
Reciprocal relations with other states	27	41	14	8[9]
Single boards of medical examiners	36	42	6	7[10]

* In three states, Arkansas, Connecticut and Florida, each of which has three separate boards, only the regular (*nonsectarian*) boards have refused recognition to low standard medical colleges.

1. District of Columbia, Massachusetts, Oregon and Wyoming.
2. Idaho, Nevada and the states named in Footnote 1.
3. See Table 3.
4. New Mexico.
5. The states in which the boards are regularly using practical laboratory and clinical tests in their examinations are Illinois, Minnesota, North Dakota, Ohio and South Dakota. A few other states use practical tests to a greater or less extent but not as extensively or invariably as in the five states named.
6. Pennsylvania, 1914; New Jersey, 1916; Alaska, 1917; North Dakota and Rhode Island, 1918; Illinois, 1921, and Michigan, 1922.
7. District of Columbia, Idaho, Massachusetts, Oregon, Utah and *Wyoming*.
8. Arizona, California, Nevada, Tennessee, Washington and the states named in Footnote 7.
9. Arizona, Connecticut, Florida, Massachusetts, Montana, Oregon, Rhode Island and Washington. To this list should be added the outlying territories of Alaska, Canal Zone, Philippine Islands and Porto Rico, which have no provision for reciprocity.
10. Multiple boards still remain in Arkansas, Connecticut, Delaware, District of Columbia, Florida, Louisiana and Maryland.

Students have actually attended certain colleges for four years, graduated and applied for licenses before they learned that the colleges were not recognized in adjoining states. Besides being a *guide for the prospective medical student*, this table shows what boards are safeguarding the people of their states against the incompetent graduates of low standard medical colleges. Based as it is on strictly official information this table last year was used by the Surgeon-General in establishing a list of "well-recognized" colleges. Unless a college is recognized by the majority of state licensing boards it is not considered as "well-recognized," and its students who are drafted are not permitted to enter the "enlisted reserve corps."

Table 2 shows the classification of the colleges of each physician licensed by examination and reciprocity during 1917. Graduates of medical schools which ceased to exist or which merged with other schools prior to 1907 are included among miscellaneous candidates. Of the physicians licensed by reciprocity, all physicians who graduated prior to 1907, when the Council's first classification was prepared, are included in miscellaneous. Members of the House of Delegates can see just how *many* of the physicians licensed in their respective states during 1917 were graduates, respectively, of Class A, B and C medical schools, and whether the people of those states are being adequately protected against the *output* of low grade colleges.

Table 3 shows that at present thirty-eight states *require one* or two years of collegiate work as a minimum standard of preliminary education and that, of this number, thirty require *two years* of such college work. The twelve states which have not adopted the higher standard are: District of Columbia, Massachusetts and Wyoming, in which as yet no standard has been fixed; Idaho and Oregon, in which the standard is less than a four-year high school education; and Delaware, Georgia, Maine, Missouri, Nebraska, Nevada and Ohio, in which a four-year high school education is the minimum requirement.

Various improvements brought about in medical licensure during the last fourteen years are set forth in Table 4. Next to the improvements in the standards of preliminary education the greatest increase (32) is in the number of states (now 37) which are refusing to recognize low grade colleges. The greatest needs at present are a wider adoption of the requirement of the hospital intern year; a general adoption of the standard of two years of premedical college work, and—a matter of extreme importance—a more general and larger use of practical laboratory and clinical tests in the state licensing examinations. Such tests to a fairly satisfactory extent are now being used in Illinois, Minnesota, North Dakota, South Dakota and Ohio and to a lesser extent in a few other states. An excellent example of how these examinations could be conducted is now being furnished frequently by the National Board of Medical Examiners.

CHART 1.—MEDICAL SCHOOLS AND ENTRANCE REQUIREMENTS

This chart shows (heavy line at the top) the total numbers of medical schools existing in the various years. The chart also shows the numbers of medical schools requiring for admission (horizontal shading, indefinite, estimated) a four-year high school education; (vertical shading) one year of premedical college work and (heavy shading) two years of premedical college work.

	1900	'01	'02	'03	'04	'05	'06	'07	'08	'09	'10	'11	'12	'13	'14	'15	'16	'17	'18
Totals	160	160	160	160	160	158	162	*139*	151	*140*	131	132	*118*	107	*106*	*96*	95	*94*	*94*
Totals (a)	158	158	158	157	156	153	136	148	135	116	91	80	72	60	24	12	10	9	9
Totals (b)	..	..	..	..	..	..	1	2	5	8	13	14	*16*	*16*	44	44	38	31	*6*
Totals (c)	2	2	2	3	4	5	5	9	11	16	27	28	30	31	34	40	47	54	79

Requiring for admission (*a*) a high school education *or less;* (*b*) one year of college work; (*c*) two or more years of college work.

Reference has just been made (see Table 3) to the adoption by state licensing boards of higher requirements of preliminary education. Progress in this particular since 1900 is shown in the accompanying Chart 2. This chart shows just how *many* states in each year had adopted, respectively, a four-year high school education or higher standards of preliminary education. In 1900, only six states had made provision for preliminary education in their practice acts and *in only one* of these was the standard fixed at a four-year high school education *or its equivalent.* Since 1900, wide publicity has been given to the serious conditions in medical education and progress since that time has been rapid. In 1904, the Council on Medical Education advocated two standards of medical education, *one for immediate adoption* which recommended a four-year high school course as the *minimum* entrance requirement and another—the "ideal standard"—*which advocated one year of college work including courses in* physics, chemistry and biology. Colleges and state boards were urged to adopt the latter standard by *Jan. 1, 1908, but* the time was extended till Jan. 1, 1910. By 1910 the number of states providing for preliminary education had increased to thirty-six, in twenty-eight of which *a four-year high school* course was required. The light and heavy dotted lines indicate the number of boards each successive year beginning in 1912, which have *adopted,* respectively, one or two years of collegiate work in addition to a four-year high school education as the *minimum preliminary qualification* for the license in those states. Note that the marked increase occurred in 1914 for the adoption of one year of college work and in 1918 for the two year requirement. These are the years when, respectively, one year and two years of college work were made an essential requirement for admission to Class A medical schools. The increases in the numbers of states *adopting* the higher preliminary standards as indicated by the dotted lines correspond quite closely also with the increases in the numbers of medical colleges which adopted those standards (see Chart 1). The dotted lines show when the requirements affected students *matriculating* in medical colleges. Those requirements did not become effective for all *graduates* until four years later; hence the portions of the chart shown by the vertical and the heavy shading indicate for each year the numbers of states in which, respectively, one year and two years of college work were required of all graduates seeking licenses to practice in those states.

National Board of Medical Examiners

The National Board of Medical Examiners was organized in 1915 and sought the endorsement of the House of Delegates. That matter was referred to the Council on Medical Education for special investigation which was made during the fall of 1915. Further information was brought out in a series of papers read at a joint conference of the Council and the Federation of State Medical Boards in February, 1916. It was found that the personnel of the board consisted of men of high qualifications and that the methods being followed were such as would uphold the standards of education established by the Council and which had been adopted by many of the state licensing boards of the country. On recommendation of the Council, therefore, the National Board of Medical Examiners was endorsed by this body in June, 1916. The personnel of the board at present is as follows: Rear Admiral William C. Braisted, Surgeon-General, United States Navy; Surg.-Gen. William C. Gorgas, United States Army; Surg.-Gen. Rupert Blue, United States Public Health Service; Capt. Edward R. Stitt, Col. Louis A. LaGarde, Assistant Surg.-Gen. William C. Rucker, Dr. Victor C. Vaughan, Dr. Horace D. Arnold, Dr. Austin Flint, Dr. Walter L. Bierring, Dr. Henry Sewell, Dr. E. Wyllys Andrews, Dr. Louis B. Wilson, Dr. Herbert Harlan, and Dr. Isadore Dyer.

Funds to meet the expenses of the board have been provided by the Carnegie Foundation for the Advancement of Teaching, which has given $15,000 per year for that purpose, for an indefinite number of years. This generosity has enabled the board to get its work well started without having to charge examination fees. The only fee for each candidate is $5 for registration.

Recognition of the National Board has already been granted by eleven states and holders of its certificates will be registered without further examination in Colorado, Delaware, Idaho, Kentucky, Maryland, New Hampshire, North Carolina, North Dakota, Pennsylvania, Rhode Island and Vermont. When the permanency of the Board is established and the high character of its examinations is more generally recognized, it is quite probable that its certificate will be recognized by the licensing boards of a larger number, if not of all, states.

The board has held six examinations, the first two in Washington, D. C., held respectively, in October, 1916, and June, 1917; third in Chicago in October, 1917, and the fourth in New York in January, 1918. At these examinations altogether 70 physicians were examined, of whom 54 passed and 16, or 23 per cent., failed. The figures for each of the four examinations are shown in the following table:

Date of Examination	Where Held	Total Examined	Passed	Failed	Percentage Failed
October, 1916	Washington	10	5	5	50.0
June, 1917	Washington	12	9	3	33.3
October, 1917	Chicago	28	22	6	21.5
January, 1918	New York	20	18	2	10.0
Totals		70	54	16	23.0

Two other examinations were held in April at Forts Oglethorpe and Riley, but the final grades have not been received.

EDUCATION PRELIMINARY TO THE STUDY OF MEDICINE

At the annual meeting of the American Medical Association, held in June, 1916, the House of Delegates adopted the recommendation of the Reference Committee on medical education, instructing the Council to not retain in Class A after January 1, 1918, any medical school that was not requiring for admission at least two years of work in a college of arts and sciences approved by the Council or in lieu thereof an equivalent education as demonstrated by the properly conducted examination approved by the Council. The recommendation further stated that two years of college work represented "the highest requirement of preliminary education that should be legally established in this country."

In February, 1917, a special committee was appointed by the Council to study the problem, to suggest a subject content of the two-year premedical college course, and to develop a schedule of the subjects which would best prepare the student for his subsequent medical studies.

CHART 2.—STATE REQUIREMENTS OF PRELIMINARY EDUCATION

As shown by Medical Practice Acts and Board Rules

Showing by years the increased number of states *requiring* (diagonal shading) any preliminary requirement (horizontal shading); a four-year high school education (vertical shading); one year of college work, and (heavy shading) two years of college work.

The light and heavy dotted lines in the horizontal shading indicate, respectively, when the one-year and the two-year requirements were *adopted*—when they began to affect *matriculants* in medical schools. The requirements did not affect *graduates* until four years later, as indicated by the vertical and heavy shading. Each vertical line represents a year as indicated. (Compare this chart with Chart 1.)

2 yrs. coll...	..	..	..	..	..	..	..	..	..	..	..	..	2	2	3	6	6	6	6	9	10	12	29	30

The committee was made up as follows:

Dr. Kendric C. Babcock, Urbana, Ill., chairman, formerly specialist in higher education of the United States Bureau of Education; now dean of the College of Liberal Arts and Sciences of the University of Illinois and intimately identified with the work of the North Central Association of Colleges and Secondary Schools and the Association of American Universities in standardizing colleges of arts and sciences.

Prof. George Gailey Chambers, director of admissions, University of Pennsylvania, Philadelphia, representing the Association of American Universities.

Dr. W. F. R. Phillips, professor of anatomy of the Medical College of the State of South Carolina, Charleston, representing the Association of American Medical Colleges.

Dr. Theodore Hough, dean of the University of Virginia Department of Medicine, Charlottesville.

Dr. N. P. Colwell, secretary of the Council on Medical Education of the American Medical Association, Chicago.

Although of great importance to medical education, this was a matter which chiefly concerned academic colleges and universities; and for that reason, associations of such colleges were ably represented on the committee. Presidents and deans of such colleges were generally and freely consulted in the study of the problem. A preliminary report of the committee was published in *The Journal* of Aug. 18, 1917.

Following the discussions at the annual conferences of the Council on Medical Education and the Association of American Colleges in Chicago in February, 1918, the committee met and completed its report, which, as finally adopted, is as follows:

I. HIGH SCHOOL REQUIREMENTS

(*a*) For admission to the two-year premedical college course, students shall have completed a four-year course of at least fourteen units (fifteen after Jan. 1, 1920) in a standard accredited high school or other institution of standard secondary school grade, or have the equivalent as demonstrated by examinations conducted by the College Entrance Examination Board, or by the authorized examiner of a standard college or university which has been approved by the Council on Medical Education. Unless all the entrance units are obtained by examination, a detailed statement of attendance at the secondary school, and a transcript of the student's work, should be kept on file by the college authorities. This evidence of actual attendance at the secondary schools should be obtained, no matter whether the student is admitted to the freshman or to higher classes.

(*b*) Credits for admission to the premedical college course may be granted for the subjects shown in the following list and for any other subject counted by a standard accredited high school as a part of the requirements for its diploma, provided that at least eleven units must be offered in Groups I-V:

SCHEDULE OF SUBJECTS REQUIRED OR ACCEPTED FOR ENTRANCE TO THE PREMEDICAL COLLEGE COURSE

Subjects	Units*	Required
Group I, English—		
Literature and composition	3-4	3
Group II, Foreign Languages—		
Latin	1-4	2†
Greek	1-3	
French or German	1-4	
Other foreign languages	1-4	
Group III, Mathematics—		
Elementary algebra	1	1
Advanced algebra	½-1	..
Plane geometry	1	1
Solid geometry	½	..
Trigonometry	½	..
Group IV, History—		
Ancient history	½-1	1
Medieval and modern history	½-1	
English history	½-1	
American history	½-1	
Civil government	½-1	
Group V, Science—		
Botany	½-1	..
Zoology	½-1	..
Chemistry	1	..
Physics	1	..
Physiography	½-1	..
Physiology	½-1	..
Astronomy	½	..
Geology	½-1	..
Group VI, Miscellaneous—		
Agriculture	1-2	..
Bookkeeping	½-1	..
Business law	½	..
Commercial geography	½-1	..
Domestic science	1-2	..
Drawing, freehand and mechanical	½-2	..
Economics and economic history	½-1	..
Manual Training	1-2	..
Music: Appreciation or harmony	1-2	..

---

* A unit is the credit value of at least thirty-six weeks' work of four or five recitation periods per week, each recitation period to be not less than forty minutes. In other words, a unit represents a year's study in any subject in a secondary school constituting approximately a quarter of a full year's work. A satisfactory year's work in any subject cannot be accomplished under ordinary circumstances in less than 120 sixty-minute hours, or their equivalent.

† Both of the required units of foreign language must be of the same language, but the two units may be presented in any one of the languages specified.

Of the fourteen units of high school work (fifteen after Jan. 1, 1920), eight units are required, as indicated in the foregoing schedule; the balance may be made up from any of the other subjects in the schedule.

II. PREMEDICAL COLLEGE COURSE

(*c*) Beginning Jan. 1, 1918, the minimum requirement for admission to acceptable medical schools, in addition to the high school work specified above, will be sixty semester hours of collegiate work, extending through two years, of thirty-two weeks each, exclusive of holidays, in a college approved by the Council on Medical Education. The subjects included in the two years of college work should be in accordance with the following schedule:

SCHEDULE OF SUBJECTS OF THE TWO-YEAR PREMEDICAL COLLEGE COURSE

Sixty Semester Hours* Required

Required Subjects:	Semester Hours
Chemistry (a)	12
Physics (b)	8
Biology (c)	8
English composition and literature (d)	6
Other nonscience subjects (e)	12
Subjects Strongly Urged:	
French or German (f)	6-12
Advanced botany or advanced zoology	3-6
Psychology	3-6
Advanced mathematics including algebra and trigonometry	3-6
Additional courses in chemistry	3-6
Other Suggested Electives:	
English (additional), *economics*, *history*, sociology, political science, logic, mathematics, Latin, Greek, drawing.	

---

* A semester hour is the credit value of sixteen weeks' work consisting of one lecture or recitation period per week, each period to be not less than fifty minutes net, at least two hours of laboratory work to be considered as the equivalent of one lecture or recitation period.

SUGGESTIONS REGARDING INDIVIDUAL SUBJECTS

(*a*) *Chemistry.*—Twelve semester hours required (eight until Jan. 1, 1919) of which at least eight semester hours must be in general inorganic chemistry, including four semester hours of laboratory work. In the interpretation of this rule work in qualitative analysis may be counted as general inorganic chemistry. The remaining four semester hours (required after Jan. 1, 1919) may consist of additional work in general chemistry or of work in analytic or organic chemistry.

(*b*) *Physics.*—Eight semester hours required, of which at least two must be laboratory work. It is urged that this course be preceded by a course in trigonometry. This requirement may be satisfied by six semester hours of college physics, of which two must be laboratory work, if preceded by a year (one unit) of high school physics.

(*c*) *Biology.*—Eight semester hours required, of which four must consist of laboratory work. This requirement may be satisfied by a course of eight semester hours in either general biology or zoology, or by courses of four semester hours each in zoology and botany, but not by botany alone.

(*d*) *English Composition and Literature.*—The usual introductory college course of six semester hours, or its equivalent is required.

(*e*) *Nonscience Subjects.*—Of the sixty semester hours required as the measurement of two years of college work, at least eighteen, including the six semester hours of English, should be in subjects other than the physical, chemical or biologic sciences.

(*f*) *French or German.*—A reading knowledge of one of these languages is strongly urged. If the reading knowledge in one of these languages is obtained on the basis of high school work, the student is urged to take the other language in his college course. It is not considered advisable, however, to spend more than twelve of the required sixty semester hours on foreign languages. In case a reading knowledge of one language is obtained by six semester hours of college work, another six semester hours may be well spent in taking the beginner's course in the other language; if this is followed up by a systematic reading of scientific prose, a reading knowledge of the second language may be readily acquired. When a student spends more than two years in college he may well spend twelve semester hours of his college work in the second language.

Revision of the Council's Classification of Medical Colleges

The reorganization of medical education has now advanced to the point where another general classification of medical schools is essential and should be made as soon as circumstances will permit. This reclassification has been considered repeatedly by the Council during the last three years, but each time for good reasons definite action was postponed. Aside from the necessity of this revision on general grounds, it is now of special importance in connection with the recognition of medical schools by the federal service under the regulations of the selective service law. Since the effect of these regulations will be the closure of such institutions as are not considered "well-recognized" because of the drafting of their students, if the war continues any length of time, it is particularly important that the Council's classification shall be made in strict justice and that it be based on the actual conditions now existing in the schools.

At its February meeting, the Council voted to submit to the House of Delegates, for its approval, a slightly modified basis for the classification of medical schools and asked for authority to proceed with the general reclassification on the new basis. The revised schedule for the grading of medical schools is as follows:

New Schedule for the Grading of Medical Schools

Schools will be rated as heretofore on a civil service basis on a scale of 1,000 points. The data relating to each school will be grouped under ten general heads in such manner that the groups will have as nearly equal weight as possible, each group allowing a possible 100 points (10 per cent.) out of a possible 1,000 points (100 per cent.). The revised schedule showing the general heads under which the data will hereafter be arranged are as follows:

1. Character of curriculum, grading of course, sequence of subjects, supervision, administration, etc.
2. Medical school buildings; adaptability, light, heat, ventilation, cleanliness, etc.
3. Laboratory facilities and instruction.
4. Dispensary facilities and instruction.
5. Hospital facilities and instruction in medicine, surgery, obstetrics, and gynecology.
6. Hospital facilities for instruction in medical specialties and provision for clinical clerkships, necropsies, etc.
7. Full-time instructors and assistants with special reference to their special qualifications and evidences of their work, including research.
8. Faculty, number, qualifications and organization of, including the staff of teaching hospitals.
9. Library, museum, charts and special apparatus and evidences of the use made of them.
10. Showing of graduates at state board and other examinations and other evidences by which the training received is indicated.

It will be noted that the question of financial income is not directly referred to in the ten heads outlined. It is quite evident, however, that no college can secure an adequate number of expert full-time teachers, provide well equipped laboratories, library and museum, and be conducted in accordance with present-day medical knowledge without a liberal income in addition to students' fees.

Class A Colleges will, as heretofore, be those which are acceptable; Class B, those which, under their present organization, give promise of being made acceptable by general improvements, and Class C those which (*a*) require a complete reorganization to make them acceptable; (*b*) which do not keep satisfactory records of their students in regard to entrance requirements, attendance, grades in courses, division into classes and reasons for promotion; (*c*) which do not enforce their requirements in regard to admission (including those admitted to advanced standing), promotion and graduation; (*d*) which give the major portion of their instruction after 4 o'clock in the afternoon; (*e*) which are privately owned and conducted for profit, and (*f*) which for other specific reasons are not eligible for inclusion in Class B.

Continuous Sessions in Medical Schools

At the conference held in February, the chairman of the Council who is a member of the Surgeon-General's staff at Washington, presented a scheme for a continuous session in medical schools. The scheme outlined, suggested that for the duration of the war, each year be divided into three periods, of four months each, these sessions beginning in October, February and July of each year. It was shown that the student could enter on the study of medicine at the beginning of any one of these periods and continue for eight successive periods of four months each, at which time he would graduate and enter on an intern service of one calendar year. This would require just four calendar years when he would be ready for active service with the Army. It was argued that by the adoption of this or some similar scheme the summer periods heretofore looked on as vacation time would be utilized; the extensive teaching plants would be kept in continuous operation, and students would be graduated from nine to twelve months earlier than under the methods heretofore prevailing. Under this scheme the present junior class would be graduated four months earlier; the present sophomore class would be graduated eight months earlier, and the present freshman class would be graduated a year earlier than under the former method. It was argued also that since there would be no vacations for the boys in the trenches, or for the medical officers in the service, there appeared to be no reason why those remaining at home in the enlisted reserve corps, or on the teaching staffs should not utilize the summer months to good advantage. The Council, however, is not unanimously in favor of the continuous session, since one member believes that the speed of production gained would not compensate for the loss of the thoroughness in teaching and the drain on the students health. It is stated that at McGill and Toronto Universities in Canada the system has been abandoned excepting for the last year students.

Present Scope of the Council's Work

During the fourteen years since the Council on Medical Education was established its work has developed and broadened under the direction of the secretary of the Council:

(*a*) Statistics are collected each year regarding the successes and failures of physicians at examinations conducted by state medical licensing boards. This material is tabulated and published in April each year in the State Board Number of The Journal.

(*b*) Statistics are collected each year in regard to medical colleges, students and graduates in the United States and Canada. These statistics are tabulated and published in August each year in the Educational Number of The Journal. Information also in regard to foreign medical colleges is being regularly obtained and kept on file.

(*c*) During the last five years the secretary of the Council has also had supervision of the American Medical Directory. This is a logical arrangement since so much of the data going into it is regularly obtained by the Council.

(*d*) The biographical index of physicians of the United States, which was begun with the publication of the American Medical Directory, is now under the direction of the secretary of the Council. Official information in regard to the graduation and licensing of each physician, which is regularly obtained, enables the Council to keep the biographical index of physicians up to date. This file now contains cards for 152,000 physicians of the United States and Canada.

(*e*) Since 1910 a register of medical students has been kept by the Council. This consists of an index showing full data regarding medical students from the time they enter the medical school. When the student has graduated, has obtained a license and has secured a location, his card is transferred to the biographical index of physicians. The information in this file is such that, should the records in any of the colleges be destroyed by fire or otherwise, the Council could replace the essential data regarding the students.

(*f*) The "Personal File" of information regarding physicians has thus far been kept up by various departments of the Association, but has always been an important adjunct to the biographic index of physicians. Recently, through the urging of the Federation of State Medical Boards, arrangements have been made to enlarge this file, so as to make the Council's headquarters a central bureau of information, especially in regard to illegal practitioners of medicine.

(*g*) The Council keeps in touch with all state licensing boards, noting changes in the personnel of those boards and in the requirements regulating the practice of medicine in the various states, particularly in regard to the educational standards enforced. At certain intervals information regarding the requirements to practice medicine in foreign countries is also obtained, through the American ambassadors or consuls in those countries. On the basis of this information a book of "Laws (Abstract) and Board Rulings Regulating the Practice of Medicine in the United States and Elsewhere" is compiled by the Council and published each year.

(*h*) Three tours of inspection of all the medical colleges in the United States have been completed, and of certain medical colleges six or more inspections have been made. Of the medical schools of Canada, two tours of inspection have been made. The classification of medical schools is published at frequent intervals in *The Journal of the American Medical Association* and in pamphlets. It is revised each year in accordance with changes made in the ratings of individual colleges.

(*i*) The Council conducts an annual conference on medical education and licensure. The conference has grown until it has drawn to it the annual meetings of other educational agencies, resulting in what might be termed an annual congress on medical education and licensure. This congress is now participated in by the Council, the Association of American Medical Colleges and the Federation of State Medical Boards of the United States. Other educational bodies are also holding meetings during the time of the conference. This annual conference has been the "open forum" where educational standards and other problems relating to medical education have been brought up for discussion. These conferences have resulted in securing united action by the various agencies interested in medical education, which accounts partly for the rapid progress since the Council was organized.

(*j*) From the beginning of this work the Council has carried on a campaign for higher standards of preliminary education, not only with medical colleges but also with state licensing boards.

(*k*) Since 1913, of the annual reports of the United States Bureau of Education, the chapter on medical education has, on request, been furnished by the secretary of the Council.

(*l*) The improvements resulting from the Council's work, through its conferences, its classifications of colleges and its campaign for standards of education, has made the Council an important factor in the standardization of high schools, and, more recently, of colleges of arts and sciences. Several years ago an effort was made to ascertain whether an education in an approved four-year high school was actually being required for admission by medical schools. More recently, under the increased entrance standard, it became equally essential to ascertain whether the medical school was actually requiring two years of work in an approved college of arts and sciences. In 1912 the secretary of the Council collected the material for the preparation of a list of approved high schools, the list to include only those high schools which were accredited by the various state universities. It was found unnecessary to continue that work, however, since Dr. Kendric C. Babcock, then specialist in higher education of the United States Bureau of Education, consented to take it up. During the last two years the Council has compiled a list of approved colleges of arts and sciences, basing that approval on the list of colleges approved by standardizing agencies in whose methods the Council has confidence. This list by the Council may also be unnecessary at a later time when the Bureau of Education or other agencies shall be in position to compile such a list and keep it up to date.

(*m*) At the beginning of its work the Council published two standards, one for immediate adoption by the medical schools and state boards. The first was for immediate adoption and advocated a four-year high school education, a four-year medical course, and an examination for the license to practice. The second, then termed the "ideal" standard, advocated a year of preliminary collegiate preparation, including courses in physics, chemistry and biology, a four-year medical course and a year's internship in a hospital, preceding the examination for the license. This ideal standard has been exceeded in the matter of preliminary requirements, since two years of college work, instead of one, has proved to be the most satisfactory arrangement in this country. There remains the general adoption of the hospital intern year to entirely fulfill the requirements of the ideal standard suggested by the Council in 1905. Special effort in this direction is now being made. In 1914 a list of hospitals considered in position to furnish acceptable internships was prepared and published. During 1915 this list was carefully reviewed by state advisory committees and in 1916 a revised edition was published. At the annual meeting in 1917 the House of Delegates adopted the recommendation of the Reference Committee on Medical Education that $2,500 a year for three years be appropriated to further the work of investigating and standardizing hospitals. This increased appropriation has been granted by the board of trustees. The work will be advanced, therefore, definite standards will be fixed and a limited amount of hospital inspection will be done. In this work, the Council will cooperate with medical colleges, state licensing boards and other interested agencies.

(*n*) The Council has naturally kept itself fully informed regarding the various medical cults and has been in position to furnish reliable information in regard to them where such information was needed. Most of the cult schools have been inspected and first hand information regarding them is available, especially in regard to some of them which during the last year or so have received the legal right to grant M.D. degrees. On account of (*a*) the lack of, or exceedingly low entrance requirements; (*b*) the lack of teachers who have had a complete medical training; (*c*) the failure to study and recognize the various factors entering into the causation of diseases; (*d*) the resulting failure to ascertain the effective therapeutic measures which might be used, and (*e*) the lack of adequate laboratories, laboratory equipment, hospitals and clinical material—on account of all these deficiencies, no cult college could be considered as equal to the average medical college rated in Class C. The chief objection to the medical cult colleges has not been to the medical cults *per se*, but to their lack of, or seriously low educational standards.

(*o*) The headquarters of the Council have, in fact, become a clearing house of information in regard to medical education, medical licensure, medical cults and other matters pertaining to these subjects. The Council has at its headquarters information which cannot be obtained in any other place. The use which state boards and others are making of this information has grown tremendously, as indicated by the voluminous correspondence that comes regularly to the headquarters of the Council. A tremendous amount of information goes also to prospective medical students and the demand for the pamphlet entitled "Making the Right Start," which was prepared especially for prospective medical students, has been constantly increasing. The volume of correspondence required to answer inquiries is already large and is steadily increasing. Much of the information is now regularly published in the *Monthly Bulletin* of the Federation of State Medical Boards, which goes to all members of all state boards.

The Council's Permanent Files

The files of data at the headquarters of the Council are as follows:

(*a*) Announcements of medical schools of the United States: These files are being kept up to date and so far as possible back numbers of the announcements of schools have been obtained. Catalogues of many of the foreign medical schools are also on file.

(*b*) Lists of medical graduates: This file consists of alumni lists, either in printed or card index form, which are complete for all schools existing as well as for the majority of schools which have become extinct. For the extinct schools our information is occasionally being added to and our files are gradually becoming more complete.

(*c*) Information in regard to foreign medical colleges, foreign graduates and the legal requirements for practice abroad.

(*d*) Biographical index of physicians of the United States and Canada. Every card shows the personal and educational history of each physician. Official data regarding the medical graduation and licensure of each physician is shown.

(*e*) Biographical card index of medical students enrolled in the medical colleges of the United States and Canada. Reports are received each year which keep this index up to date.

(*f*) Data obtained from the inspections of all medical colleges.

(*g*) Miscellaneous pamphlets bearing on medical education.

(*h*) Catalogues and other information in regard to medical cults. Much information has been obtained by actual inspection.

THE COUNCIL'S WORK AND THE WAR

As already stated, by the time this country entered the world war the reforms among medical colleges had made sufficient progress that for several years most of the medical graduates had benefited from the improved conditions in medical schools, such as the higher entrance requirements, the more skilled teachers, the better laboratories and laboratory equipment, the better clinical material and the greatly improved methods of medical teaching. It is the graduates of the last several years also, who, in largest proportions, have entered the government medical services. But the Council and the information it has collected have rendered other important services to the government, which are briefly enumerated as follows:

(*a*) When the selective service law was enacted, it made no provision for the exemption of medical students. In the Medical Students' Register, the Council had the home addresses of the majority of the students enrolled during 1916-1917, and was able by direct correspondence to secure reliable information showing the proportion of students who would be taken by the draft. The data collected had much to do with the provision made later whereby drafted students were permitted to enter the enlisted reserve corps and to remain in the medical colleges until they should complete their medical training.

(*b*) Only such students were eligible for admission to the enlisted reserve corps as were enrolled in "well-recognized" medical colleges, which were defined as those recognized by the majority of state medical licensing boards. The only information immediately available by which it could be decided which colleges were so recognized, was Table D published last year in State Board Statistics (similar to Table 1 in this report) and which was based on reports signed by the various state board officers.

(*c*) The Council's files of information in regard to medical colleges were also placed at the disposal of the Surgeon-General, and the secretary of the Council has cooperated in inspecting and furnishing reports to the Surgeon-General regarding a number of medical schools.

(*d*) The biographical information in the files at the Council's headquarters has been used for the Surgeon-General in checking the qualifications of applicants for the medical reserve corps before commissions were granted. That information has also made possible the compilation and publication of the Honor Roll of Physicians in the campaign for the enlistment of additional medical officers.

(*e*) The Council's files of information in regard to standards of preliminary and medical education have likewise been utilized by the Surgeon-General's Office. This information included, also, a list of the approved colleges of arts and sciences and a list of hospitals considered in position to furnish acceptable internships, both of which lists were compiled by the Council.

IN CONCLUSION

The above outline of the Council's work shows the character of the information gathered and the great service it has rendered to the public, to the medical profession, and, more recently, to the government. Some idea, also, can be formed of the influence which, through its Council on Medical Education, the American Medical Association is wielding in the educational world. Through the work of the Council, the medical profession is being recreated by shutting off the supply from low grade colleges and increasing the output of high grade, well equipped colleges. Under the increased standards of preliminary education and the highly improved methods of teaching, the entire medical profession will be on a much higher plane of education, culture, training and technical skill than has ever before been true. This will place so wide a zone between the qualifications of physicians and those of followers of the various cults, that all laymen of average intelligence will be able to note the difference. Of more importance, however, because of this successful campaign for an improved medical education, the average physician will be able to render a far better service to the public and to the soldiers and sailors who are fighting with our allies in the world war.

Respectfully submitted.

Council on Medical Education,

H. D. ARNOLD, Chairman   WILLIAM PEPPER
R. C. COFFEY   HARRY GIDEON WELLS
W. D. HAGGARD   N. P. COLWELL, Secretary

Report of the Council on Scientific Assembly

The report of the Council on Scientific Assembly was received as printed in the Handbook and referred to the Reference Committee on Reports of Officers.

The report is as follows:

To the Members of the House of Delegates of the American Medical Association:

The Council on Scientific Assembly desires to repeat and to emphasize what it said last year with regard to the number of section meetings in the Scientific Assembly. It will be recalled by those members of this house who were seated at the 1915 session, this same opinion was presented in the excellent report of the special committee on Sections and Section Work: that is, that at our annual sessions too many section meetings are held at the same time. There is no question as to this. The annual sessions of the British Medical Association are often compared with our annual sessions to the advantage or disadvantage of the one or the other, according to the point of view. The British Medical Association is charged with devoting too much time to social functions and renewing acquaintances and too little time to scientific work. We are accused—and the Council on Scientific Assembly believes this is a just criticism—of devoting too much time to scientific work and too little to social enjoyment and getting acquainted with each other.

Your Council is of the opinion that a more effective distribution of time will be presented if the Sections are limited to one meeting a day. Those men who are particularly interested in what they regard as their particular section feel it their duty to attend all the morning and afternoon meetings, any one of which is liable to be extended.

It is a strain to attend every meeting of a section.

It is possible to have too much of a good thing.

There is such a bewildering abundance in the program of the Scientific Assembly that the average man is at a loss to know what section to attend and not infrequently finally ends by not attending any. The man who is faithful to one particular section has no opportunity of attending the meetings of other sections. It would be a good thing for the ophthalmologist if he were free in the morning or the afternoon, to attend the laryngological section and it would do him no harm if he attended the Section on Practice of Medicine or the Section on Nervous and Mental Diseases, or some other; nor would it injure the laryngologist to visit the ophthalmological section or any of the others. This applies also to the internist, the surgeon, the obstetrician, the neurologist, the dermatologist, in fact to all physicians. Our Scientific Assembly ought to be so conducted that a man would not think he was neglecting the section in which he has an especial interest when he takes time to keep in touch with what is being done in other sections or to meet other physicians outside the sections.

The present division of the Scientific Assembly has developed gradually as a result of groups of men, engaged in a special line of practice, requesting the formation of separate sections for their specialties. At the present time, certain individuals and groups cannot get away from the opinion that the sections are independent organizations to which they belong by virtue of "membership" and to which they must give allegiance. They seem not to realize that there is no provision for affiliation with a section other than that a Fellow registering as in attendance at an annual meeting is privileged to "designate the section in which he wishes to be enrolled," and this is for the purpose of voting for section officers. It should be emphasized that the Scientific Assembly of the American Medical Association is an entity and that the sections are merely parts of a whole.

The Council would not be misunderstood. Allegiance to a particular section is desirable. It has been and is an important factor in developing scientific work.

The Council is gratified to note that in addition to the Section on Ophthalmology, which by the standing rules of the section has limited the number of papers admissable to its program for any annual session to twenty-five, the Section on Practice of Medicine took action last year fixing twenty as the maximum number of contributions to be listed on its program.

Friday Meetings of the Scientific Assembly

The Council desires to lay stress on the importance of the sections arranging attractive programs for the meetings of Friday of the week of the annual session. Prior to the annual session of 1917, it was the custom for the Scientific Assembly to close with the Thursday afternoon meetings, the sections listing their papers in not more than five units or meetings. The first of these meetings was held on Tuesday afternoon. Rarely, one or two sections continued through to Friday morning. Apparently, when the opening meeting of the sections was fixed for Wednesday morning there was a tendency on the part of the sections to make available only the four meetings on Wednesday and Thursday. The Council on Scientific Assembly has endeavored to induce the sections to utilize the two units on Friday for such meetings. It is important that this shall be done in order that the scientific program may be distributed through six units, two each on Wednesday, Thursday and Friday so as to maintain and improve the scientific value of the program and yet permit fewer meetings held simultaneously. With this end in view, the Council on Scientific Assembly has been successful in securing the cooperation between the sections and arranging for a continuation of the program throughout Friday. If the full three days are used for section meetings, it will be very easy to carry out the suggestion that the number of these meetings being held at the same time shall be not more than eight.

Meetings of the Section on Miscellaneous Topics

In accordance with the authority vested in this Council, it has arranged for two series of meetings of the Section on Miscellaneous Topics and has appointed officers for each of these series of meetings. The first series of two meetings under this section is assigned to a discussion of questions relating to the reeducation and reclaiming of the war injured and is being conducted under the chairmanship of Lieut.-Col. Frank Billings, Chicago, who is in charge of this work in the Surgeon-General's Office, with Major James Bordley, Jr., Baltimore, vice chairman, and Major Harry Mock, Chicago, secretary. A second group of meetings of the Section on Miscellaneous Topics is assigned to the discussion of questions pertaining to the execution of the selective service regulations and the Council appointed the following officers for these meetings: Major Hubert Work, Pueblo, Colo., chairman, who is medical aide in Provost Marshal General's Office; Major Reuben Peterson, Ann Arbor, Mich., medical aide to the governor of Michigan, vice chairman, and Major John M. Dodson, Chicago, medical aide to the governor of Illinois, secretary.

Respectfully submitted.

E. S. Judd, Chairman,
Roger S. Morris,
George H. Simmons,
J. Shelton Horsley,
Alexander R. Craig.

Report of the War Committee of the American Medical Association

The report of the War Committee was presented by the chairman, Dr. Hubert Work, Colorado, and referred to the Reference Committee on Reports of Officers.

The report is as follows:

To the Members of the House of Delegates of the American Medical Association:

The War Committee, constituted by action of the Board of Trustees at its annual meeting held Oct. 19, 1917, and ratified by a postal vote of this House of Delegates, as soon as it was empowered, proceeded to Washington in company with the Editor of The Journal. On its arrival there, your committee sought and obtained an interview with the Provost Marshal-General and his associates and formally tendered the services of the American Medical Association to that office for such service as the Association could render in the creation of medical advisory boards. The Provost Marshal-General asked the committee to submit a definite working proposition for the formation and supervision of these boards. This the committee did and the general plan was approved by the Provost Marshal-General and afterward adopted.

Your committee then returned to Chicago and arranged a meeting with representatives of the Committee on States Activities, General Medical Board, Advisory Commission, Council of National Defense. At this conference Drs. Edward Martin, Philadelphia; F. F. Simpson, Pittsburgh, and John D. McLean, Philadelphia, announced that they were in position to serve as a committee from this Committee on States Activites to cooperate with the Committee of the American Medical Association and it was agreed that these three, together with the three constituting the American Medical Association committee, should become a joint committee and that it should have authority to name a seventh member. Subsequently, this joint committee met in Washington, D. C., November 1, when the joint committee organized by electing Dr. Edward Martin, Philadelphia, chairman, adding the secretary of the American Medical Association to the committee and selecting him as its secretary.

The joint committee was advised that the Provost Marshal-General desired immediately to have suggested to him for each state the name of a member of, or of a physician who would accept a commission in the Medical Reserve Corps, in order that a request might be made to have these medical officers ordered to active duty as medical aides to the governors of the states in the erection of the medical advisory boards. The joint committee thereupon proceeded to select a physician in each state to be recommended for this duty. On November 16, the joint committee reconvened in Washington at which time the members representing the American Medical Association were advised by Dr. McLean, Secretary of the Committee on States Activities, Medical Section, Council of National Defense, that it had been found necessary to substitute twenty-four names of men for a like number agreed on at the previous meeting of the joint committee to serve as medical aides to the governors. He further reported that the men who had finally been selected, including the substitutions, had been notified of their appointments and had been ordered to present themselves in Washington to be commissioned and instructed at a conference held on Saturday, November 18. The joint committee was then called into session by Dr. Franklin Martin and the following were added to the committee: Drs. Franklin Martin, ex officio; Charles H. Mayo, President of the American Medical Association, and Robert L. Dickinson, Brooklyn. Just before the adjournment of this last named committee, the chairman of the War Committee of the American Medical Association announced that the Association stood ready to cooperate to further war interests stating definitely that the work volunteered by the Association must be done through its war committee in order to maintain the identity of the organization.

Since this meeting, held from November 16-18, inclusive, no advantage has been taken of the Association's offer to cooperate with the Council of National Defense in the matter of establishing and standardizing the medical advisory boards, or in any other direction.

In January, the War Committee of the American Medical Association learned that the medical aides to the governors were being advised by the Committee on State Activities, General Medical Board, Council of National Defense, that their work had been completed, and that their active duty would cease. An inquiry addressed to the office of the Provost Marshal-General brought a reply stating that under the Selective Service Regulations that office has, under the Secretary of War, sole and exclusive jurisdiction of the administration of the Selective Service Law and the proper steps have been taken to continue the services of medical aides to governors until such time as this office is satisfied that their services are no longer necessary.

At its meeting, held on Feb. 1, 1918, the Board of Trustees further empowered the War Committee to act in cooperation with the Provost Marshal-General's Office, the Surgeon-Generals of the Army and Navy, and such other military offices as may be deemed best in the interest and for the successful conduct of the war, and directed Dr. A. R. Mitchell of Lincoln, Neb., to succeed Dr. E. J. McKnight, deceased, as a member of the War Committee representing the Board of Trustees. It further added to the War Committee as ex officio members thereof, the President and Secretary of the American Medical Association, and the editor of THE JOURNAL.

Under date of April 3 the Surgeon-General of the Army addressed the American Medical Association submitting a memorandum of a plan for the utilization of the organization and machinery of the Association, in addition to the activities of the other bodies, viz., the Medical Section of the Council of National Defense and the different sections and organizations of the American Medical Association, for the purpose of securing future increment to the Medical Reserve Corps and for keeping the numerical strength of the Corps up to the requirements of the service. This plan contemplates a close cooperation between the office of the Surgeon-General and the officials of the American Medical Association, through the officials of the different state and county medical societies and through the different section organizations of the American Medical Association. On receipt of this communication, the War Committee convened in Chicago, April 16, and by formal action undertook the task assigned to it by the Surgeon-General of the Army, and issued a statement announcing its action and declaring its confident anticipation of the hearty, active, patriotic cooperation of all physicians for the successful accomplishment of the task. Immediately, a call was issued for a conference of the secretaries of the constituent state associations which was held at the headquarters of the Association in Chicago on April 30.

At this conference, thirty-eight constituent state associations were represented by their secretaries or an accredited alternate. Dr. Thomas McDavitt, secretary of the Minnesota State Medical Association and chairman of the Board of Trustees, was elected chairman of the conference and the entire day was devoted to the discussion of how the organized medical profession can be utilized effectively for the winning of the war and, specifically, how the American Medical Association, its constituent state associations and their component county societies can assist in enrolling the required increments for the Medical Corps of the Army and Navy. On the adjournment of the conference, the secretaries of the state associations returned to the several states with the determination to coordinate the forces of the organized medical profession in their states with other agencies working with similar objects.

To determine to what extent the medical profession in various parts of the country had met its responsibility to the government the War Committee published in THE JOURNAL for June 1 a survey or Honor Roll of the medical profession of the United States. This survey presented under each state a table which showed important facts regarding each county in the state: the area, population, total number of physicians, number of physicians under 45 and under 55 years of age, number of women physicians, number of physicians members of the county society, and the number of physicians under commission in the Army and in the Navy. In addition to this table, there was published for each state, under the counties and postoffices the names of all those physicians of the state, who had accepted commissions in the Medical Reserve Corps of the Army and Navy or who were in active service in the Medical Department of the Federalized National Guard. The published list did not include the names of the members of the regular Medical Corps, those who had been commissioned in the Reserve Corps but who had not accepted their commissions, nor those who were serving as contract surgeons. This Honor Roll has proved effective in stimulating applications of commissions in the Medical Reserve Corps. The War Committee, with the cooperation of the war committees of the state associations and of the county societies, is confident that the increments for the Medical Corps of the Army and Navy which are or will be required will be supplied. Your committee is gratified to note the prompt and altruistic response of the profession to every appeal which the American Medical Association has made to the medical profession of the United States to serve in winning the war.

Respectfully submitted,

HUBERT WORK, Chairman,
M. L. HARRIS,
A. R. MITCHELL,
Ex-officio { CHARLES H. MAYO, President,
A. R. CRAIG, Secretary,
GEORGE H. SIMMONS,
Editor of THE JOURNAL.

Address by the President, Dr. Charles H. Mayo

The Chairman introduced Dr. Charles H. Mayo, Rochester, Minn., President of the Association, who addressed the House of Delegates as follows:

To the Members of the House of Delegates of the American Medical Association:

I am very glad to meet you. These are momentous times in medicine. Never before has medicine had the opportunity that it has today to make a record for itself in the world's work. The war could not be carried on if it were not for the work that has been done by medicine. We are today able to accomplish in wholesale manner the things that we used to fight for as units.

Medicine has changed from that in the past history of the world, and especially in army life and army work. It came about through much tribulation. Away back in the earliest history of our country, Washington, an engineer himself, gave the engineers first position. The physician then was a contract surgeon, and it took a long time before he was able to get a uniform. When he first got the uniform, soldiers were instructed that they need not salute medical officers. After a time the physician got an epaulet on his left shoulder, and later he was able to wear two of them; but slowly has the physician made progress in army life. We find this lack of appreciation evidenced in various ways all over the country, and especially in Washington. Medicine is very large in what it does, but it accomplishes things by various boards in various capacities all over the country, always splitting up, never a harmonious whole. In Washington today there are seventeen different boards and bureaus of medicine. Under the Treasury Department we have the National Public Health Service; under the Bureau of Labor, the Welfare of the Children and Protection of Industries; under the Department of Commerce, we have the Census Bureau, mortality statistics, and various other things connected with that department. Under the Department of the Interior we have control of the insane and the housing of the insane, all who do not belong to some local community. The various boards and bureaus are supported by appropriations, so that while we have an opportunity to have a wonderful national bureau of health, it cannot be because we are not permitted to coordinate this work, which is the ultimate goal of medicine.

In Europe the best organized department of the army is the medical service. War has changed in its conduct today. It is the business man that conducts war, and it is necessary that he prepare for it here as was done in France and in England. It is the business of war to use in every way the highest intelligence we have, not only to bring about the best fighting force, but to look after the preservation of the health of the soldiers and to keep the nation behind it, and this is the work of trained minds.

It has been the part of physicians for ages past to allow personalities, little bickerings and trouble to prevail among themselves. I often think that probably medicine stands as high today as it deserves to stand from the manner in which we have conducted ourselves. A lack of harmony in the profession itself has resulted in the position that we occupy. There are lots of good men in the profession. In fact, all are good men. But there has been a failure to work together in the past, a failure due to conducting our business as a personal unit in competition with others. This naturally led to the present conditions. We now have the opportunity due the greatest profession in the world. Our troubles are all our own fault, and I hope that in the discussions before this body, and in the work conducted at this meeting, we shall realize our great opportunity in developing this battle against the Hun. The part that we are to play in the world was never so great as at this time, and if it is possible to eliminate in every way anything that detracts from medicine as a whole, we shall have accomplished much for the future of medicine.

The work we are carrying on is great. It must not be allowed to be belittled by any one who would bring before this body anything that would tend to defeat us, because that would be aiding and abetting the enemy. It should be looked on as treason.

In our country, I think every member of the American Medical Association is doing his bit. All of the ex-Presidents and the President of this Association are in Washington helping to conduct the medical side of things. Our Chairman of the House of Delegates is an all-time worker in Washington. In Washington we have Dr. Billings, Dr. Vaughan, Dr. Welch, Dr. William J. Mayo, and Dr. Reed and Dr. McMurtry on the medical board; and in the administration we have Surgeon-General Blue and Surgeon-General Gorgas, ex-Presidents of the Association, so that the members of this Association have in no way been negligent of their duties from the highest to the lowest.

The Chairman said: I am very glad to assure you, Mr. President, that there is no feeling in the House of Delegates except the one of cooperation. We have no animosities, no axes to grind, no friends to reward, no enemies to punish. We represent the American Medical Association for what it has tried to do in the past.

At the conclusion of his report the Secretary presented a communication by Dr. John W. Trask urging that the Committee on Nomenclature be revived and reconstituted.

Address by Major Rist

The Secretary escorted Major E. Rist of France to the platform. Major Rist said:

Mr. Chairman and Members of the House of Delegates:

I thank you very much for your warm welcome. I feel very much honored to be present at this meeting of your Association. Your Chairman has asked me to say a few words. I hesitate to do so because I know that your time is precious.

It has always been my desire to be present at one of the meetings of the House of Delegates of the American Medical Association. I am an old friend and a diligent student of your medical organizations, of your universities and medical schools, and I am particularly glad that now so many physicians and surgeons of the United States are coming over to France that ties are going to be tightened between the medical professions of both countries. I think we in France have very much to learn from you. Especially we have to learn and to try to imitate your admirable spirit of association and organization. I know a little of the perfectly marvelous work which your Association during the last sixteen or twenty years has been doing in elevating the standards of the medical profession, in improving the conditions of medical education to a degree which I think is absolutely unparalleled in the history of medicine. This you owe to the leaders of this Association and to the characteristic spirit of association work in America. We have much to learn from you in this respect, and I should like to devote as much time as possible and in some way be to France a messenger from America, to tell them what can be done if one has really that spirit of association that you possess, and to urge my fellow physicians to try and in some way do some of the things which you are doing here.

I have been studying medical education in France, in Germany, in Great Britain, and in the United States. I think medical education in the United States is now the model of the world. I am perfectly sure that nowhere could there have been established as high standards for entrance into medical schools and as high standards of education in your schools. You lead the world in this respect. And there is another field in which the United States leads the world, and that is the field of public health. In this respect, the example which is being given now by your medical officers in France is a very inspiring one which, I am quite sure, we will try to follow even during the stress of war, but in a more complete and more perfect way when this war, thanks to the powerful cooperation of the United States as a nation, and the United States Army and Navy, will be brought to a victorious conclusion.

The Chairman said: Major Rist is known as the Osler of France. You will all agree, I am sure, that our only Sir William Osler might feel very much complimented at the designation.

The Chairman appointed as the Committee on Reapportionment Drs. Edward B. Heckel, Pennsylvania; P. S. Roy, District of Columbia, and John Ridlon, Illinois.

At 12:30 the House took a recess until 3 p. m. and reconvened at 3 o'clock.

Report of Committee on Credentials

Dr. D. Chester Brown, Connecticut, Chairman, presented a report for the Committee on Credentials, that 112 delegates had registered, and their credentials had been found correct, properly authorizing them to represent the states, sections and government services from which they came.

The Committee on Credentials reported further that Dr. E. D. Kilbourne had presented himself with letters of credit from the Hawaiian State Medical Association, but the Committee finds that the Doctor has not been a Fellow of the American Medical Association for the term of two years immediately preceding this Annual Session. In consequence the Committee recommends that the courtesies of the floor of the House of Delegates, without the right to vote, be extended to Dr. Kilbourne.

Dr. Dwight H. Murray, New York, moved the adoption of the report together with the recommendation.

Seconded and carried.

Resolution for Ad-Interim Committee

Dr. Charles H. Mayo, Minnesota, introduced the following resolution:

Resolved, That the House of Delegates create an Ad-Interim Committee to deal with emergency problems which constantly arise, such committee to consist of the President, President-Elect, the Chairman of the House of Delegates, the Secretary of the Association, the last two living retiring presidents, and Chairman of the Board of Trustees.

Resolved, That the President of the American Medical Association be authorized to appoint such members of committees which have not been provided for by the House of Delegates or the Board of Trustees. The work of such committee to be reported for consideration and action to the Ad-Interim Committee. (Referred to the Reference Committee on Amendments to the Constitution and By-Laws.)

Report on Red Cross Medical Work

Major W. C. Rucker, District of Columbia, Chairman, reported on Red Cross Medical Work, stating that this Committee had had no meeting and had done no work during the past year. The responsibility for this rested on the chairman, who had been in France, and therefore had been unable to give any attention to the matter.

Resolution on Use of Drugs

Under the head of "New Business," Dr. M. L. Graves, Texas, presented a resolution relative to the use of drugs originated or manufactured by citizens of nations with which we are at war. This was referred to the Reference Committee on Miscellaneous Business.

Report of Reference Committee on Reports of Officers

Dr. H. G. Wetherill, Colorado, reported for the Reference Committee on Reports of Officers, recommending that the report of the Council on Medical Education be referred to the Reference Committee on Medical Education. There being no objection, the Chairman ordered the reference recommended.

Resolutions on Animal Experimentation

Dr. P. S. Roy, District of Columbia, offered two resolutions, which he presented as a representative of the Medical Society of the District of Columbia. The first one conveyed a protest against endeavors to check animal experimentation, declaring that persons who endeavored to arrest any aid that the medical profession through such animal experimentation or otherwise is giving to our soldiers constituted a dangerous class and were aiding the enemy. The second related to the inadequacy of the supply of trained nurses to meet the needs in civilian life, while at the same time caring for the armed forces. Both these resolutions were referred to the Reference Committee on Hygiene and Public Health.

Resolution on Rank for Women Physicians

Dr. E. O. Smith, representing the Section on Genito-Urinary Diseases, introduced a resolution recommending that the President of the United States, Secretary of War, and Surgeon-General of the Army appoint women physicians to the Medical Reserve Corps of the United States Army on the same footing and with the same rank and pay as men. This resolution was referred to the Reference Committee on Legislation and Political Action.

Dr. H. G. Wetherill, Colorado, offered a similar resolution and requested that it be referred to the same Reference Committee. The resolution was so referred.

Dr. Abraham Jacobi, New York, an ex-president of the American Medical Association, was escorted to the platform and introduced to the House of Delegates amid great applause.

Dr. John Ridlon, delegate from the Section on Orthopedic Surgery, presented a resolution in reference to universal military training, which was referred to the Reference Committee on Miscellaneous Business.

Resolution for Revision of Patent Laws

Dr. E. Eliot Harris, New York, offered a resolution calling for a revision of the patent and trademark laws as applied to all medical and surgical products and devices, which resolution was referred to the Reference Committee on Legislation and Political Action.

Resolution on Health of Civilian Communities

Dr. Floyd M. Crandall, New York, offered a resolution calling for cooperation in securing the greatest possible degree of health in the community, which was referred to the Reference Committee on Medical Education.

Amendment to By-Laws

Dr. Rock Sleyster, Wisconsin, presented the following amendment to Article IV, Section 3, by adding the following:

"Provided, however, that the House of Delegates may change the time of election by an action taken at a meeting at least a day in advance of that to which the election is to be changed, and provided, further, that the motion to change the time of election shall be supported by three-fourths of the delegates present and voting."

The amendment was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Dr. M. A. Kelso, Oklahoma, presented a resolution which was referred to the Reference Committee on Miscellaneous Business.

Resolution on Rehabilitation and Reeducation of Disabled Soldiers

Dr. George H. Kress, California, presented two resolutions. The first referred to the conserving of means now being established for the rehabilitation and reeducation of crippled soldiers, in order that these facilities may be available for similar work at the close of the war in connection with those who are injured in the course of their civil occupations. This resolution was referred to the Reference Committee on Hygiene and Public Health. The second resolution referred to the utilization of the services of women physicians of the country as members of the Medical Reserve Corps. This was referred to the Reference Committee on Legislation and Political Action.

On motion, which was duly seconded and carried, the House of Delegates adjourned, to meet at 9:30 a. m., Tuesday.

Second Meeting—Tuesday Morning, June 11

The House of Delegates met at 9:30 a. m. and was called to order by the Chairman.

A quorum being present, the Secretary read the minutes of the previous meetings.

Dr. F. C. Warnshuis, Michigan, moved that the minutes be adopted as read.

Seconded and carried.

Supplementary Report for Committee on Credentials

Dr. D. Chester Brown, Connecticut, chairman, made a supplementary report for the Committee on Credentials, stating that six additional delegates had registered and were entitled to seats in the House of Delegates.

It was moved that the report be accepted.

Seconded and carried.

Report of Reference Committee on Medical Education

Dr. E. A. Hines, South Carolina, chairman, presented the report of the Reference Committee on Medical Education, as follows:

Your committee reports to the Council on Medical Education as follows:

We recommend that the report be endorsed as a whole. No one can read and study this report and consider the results obtained without being impressed with the great importance of the Council's work and its far reaching effect on the medical profession and on the practice of medicine in the United States.

In the excitement and confusion which temporarily resulted from the entrance of this country in the war, it is pleasing to know that educational standards are still being upheld. Nothing short of extreme emergency should be permitted to in any way lower the standards which the Council has so creditably been able to establish, and in this connection several portions of the Council's report deserve special consideration and emphasis:

A thorough knowledge shows that the conditions of the government medical service are not such as to either demand or warrant any reduction in educational standards in regard to either preliminary or medical education. On the contrary, the present needs indicated are of more careful preparation and more thorough instruction than at any previous time. If, in an emergency, any change becomes necessary, it should be by establishing continuous sessions or more intensive instruction than at present prevails. But this should not result in lowering the standard of preliminary education or in reducing the number of hours or their thoroughness of instruction. Even if extreme emergency should demand shortening of the medical course, it should be at the expense of the final portion of the student's work and not at the expense of either preliminary education or of the student's training in the fundamental medical branches.

Attention is called to the standard of education preliminary to the study of medicine prepared by a special committee of the Council on Medical Education. It is evident that this report has been prepared by those who are authorities on those subjects and who have considered carefully the needs of both general and medical education in the country taken as a whole. Your committee recommends that the standard of high school and premedical college preparation included in the report of this special committee receive the endorsement of the House of Delegates.

It is recommended that the Council be given authority to proceed to prepare a new classification of medical colleges just as soon as circumstances will permit, and that the new schedule for the grading of medical schools in future classifications be endorsed.

Attention is called to the fact that the work of the Council in connection with the standardization of hospitals has been in progress since 1913 and represents the only part of the "ideal standard" suggested by the Council in 1904 which has not been generally adopted by the medical schools and state licensing boards in this country. The Council's first list of hospitals which were considered in position to furnish acceptable internships was issued in 1914 and has passed through its second edition. A third revised edition is now in course of preparation. Considering the extensive machinery provided by the American Medical Association through its various constituent state associations, your committee considers that the Council is in an unusually strong position to continue to do effective work along this line. It is recommended, therefore, that the Council be instructed to continue its work in the investigation and standardization of hospitals and that it cooperate as far as possible with medical colleges, state licensing boards and other interested agencies.

Attention is called to the paragraphs in regard to the progress in medical licensure and to the chart showing the advances in the requirement of preliminary education by state boards. These advances are paralleled only by the advances made by medical schools.

Special attention is called, however, to one portion of the Council's routine work, namely, its presentation of statistics regarding physicians licensed in various states. For example, Table 2 in the Council's report is of unusual importance, and the attention of each delegate is called particularly to the line for his home state. It will be seen that in some states graduates of low grade colleges are still being registered in large proportions. Worse than this, it will be seen that in California not only have graduates of low grade colleges been licensed, but the doors have been thrown open to graduates of osteopathic colleges. As noted in Footnote 2: "Of the 83 graduates, 73 were graduates of eight osteopathic colleges which are not generally recognized as medical schools by state licensing boards and only one of the colleges has been recognized by the California board." Attention is also called to the situation in Arkansas, Connecticut, Florida and elsewhere, where two or more separate and independent boards have to do with the licensing of physicians. As noted in Footnote 1, there is a sectarian board in Arkansas which is licensing the graduates of low grade colleges. Improvements in medical laws or in methods of medical licensure are clearly necessary in several states. The states in which changes are most needed are further indicated in Table 4.

The attention of the House of Delegates is called to the statements in regard to the scope of the Council's work and to the extensive files of information at the Council's headquarters. A reading of the statements in regard to these files will give a better appreciation of the tremendous influence exerted by the Council and its work. In fact, the Association can view with satisfaction the great assistance which, through the Council on Medical Education, the Association has been able to render to the office of the Surgeon-General in the present national crisis.

E. A. Hines, Chairman,
J. B. Blake,
W. S. Lalor,
Robert E. Noble.

It was moved and seconded that the report be adopted as read. Carried.

Report of the Reference Committee on Amendments to the Constitution and By-Laws

Dr. Floyd M. Crandall, New York, chairman, presented the report of the Reference Committee on Amendments to the Constitution and By-Laws.

The Reference Committee on Amendments to the Constitution and By-Laws would respectfully report as follows:

Amend Chapter VII, Section 3, of the By-Laws, by adding

(*f*) Ad-Interim Committee.

Sec. 9. Ad-Interim Committee.—There shall be an Ad-Interim Committee, which, between the annual sessions of the House of Delegates, shall consider and act on emergency problems which may arise. This committee shall consist of the President, the President-Elect, the Speaker of the House of Delegates, the Secretary of the Association, the Chairman of the Board of Trustees, and the last two living ex-Presidents. The Speaker of the House of Delegates shall be the Chairman of the Committee, and the Secretary of the Association its Secretary. This Committee shall be subject to the call of its Chairman.

Renumber present Sections 9, 10 and 11.

Amend Chapter V, Sec. 1, of the By-Laws by inserting the following:

He is authorized to nominate committees which have not been provided for by the House of Delegates or the Board of Trustees, which nomination shall be subject to the approval of the Ad-Interim Committee. The Committee so organized shall exist only until the next meeting of the House of Delegates. They must report to the Ad-Interim Committee before the next meeting of the House of Delegates.

At the conclusion of the report, Dr. Crandall moved its adoption, which motion was seconded by Dr. Cyrus L. Stevens, Pennsylvania.

After discussion by Dr. George D. Head, Minnesota; Dr. Floyd M. Crandall, New York; Dr. Alexander Lambert, New York; Dr. Lewis S. McMurtry, Kentucky; and the Chairman of the House of Delegates, the motion to adopt was put and carried.

Dr. Floyd M. Crandall, New York, Chairman, presented the following report for the Reference Committee on Amendments to the Constitution and By-Laws.

Amend Article 9, Section 1, of the Constitution by striking out the words "Chairman and Vice Chairman of the House of Delegates" and substitute the words "Speaker and Vice Speaker of the House of Delegates."

Floyd M. Crandall, Chairman,
H. E. Odell, Medical Inspector, U. S. Navy,
C. P. Meriwether,
Rock Sleyster,
C. L. Stevens.

The committee recommends the adoption of the amendment.

It was moved and seconded that the recommendation of the Committee be concurred in. Carried.

Dr. Floyd M. Crandall, New York, moved that the Secretary of the Association be empowered to rearrange the paragraphs and make such changes in numbering as may be necessary to render the Constitution and By-Laws consistent.

Seconded and carried.

The committee reports further:

Amend Chapter IV, Section 3 of the By-Laws by the addition of the following words: "provided, however, that the House of Delegates may change the time of election by action taken at a meeting at least one day in advance of that to which the election is to be changed, and provided, further, that the motion to change the time of election shall be supported by three fourths of the delegates present and voting."

The section will then read:

Sec. 3. Time of Election.—The election of officers shall be the first order of business of the House of Delegates after the reading of the minutes on the afternoon of the fourth day of the Annual Session of the House of Delegates (the second day of the Scientific Assembly), provided, however, that the House of Delegates may change the time of election by action taken at a meeting at least one day in advance of that to which the election is to be changed, and provided further that the motion to change the time of election shall be supported by three fourths of the delegates present and voting.

It was moved and seconded that the amendment be adopted. Carried.

It was moved that the report be adopted as a whole. Seconded and carried.

Report of Reference Committee on Hygiene and Public Health

Dr. J. W. Schereschewsky, U. S. Public Health Service, Chairman, presented the report of the Reference Committee on Hygiene and Public Health, as follows:

There has been referred to your Reference Committee on Hygiene and Public Health, among other matters, a resolution introduced by Dr. George H. Kress, California, which reads:

Whereas, Our European Allies have, in their vast necessity, found it advisable to undertake a systematic rehabilitation of crippled soldiers through occupational therapeutics, followed by reeducation; and,

Whereas, There are more people crippled in industry than there will be in our Armies if all the men now in service enter the field, if their experience corresponds to that of the Allies; and,

Whereas, A bill has recently been introduced in Congress which, if passed, will provide occupational therapeutic hospitals and auxilary workshops for rehabilitation of crippled soldiers and sailors, and will provide reeducation with compensation for services during rehabilitation. Therefore, be it hereby

Resolved, By the Medical Society of the State of California in its forty-seventh annual meeting, held at Del Monte, April 16, 17 and 18, 1918, that the necessities of the industrially injured require and warrant that the scope of the above referred to legislation be broadened to permit of provision for rehabilitation and training of those who have been incapacitated by industrial injury or by personal injury.

Dr. Wilmer Krusen, Pennsylvania, moved the adoption of the resolution as read.

Seconded and carried.

The committee also had referred to it a resolution by Dr. Roy, representing the Medical Society of the District of Columbia, which reads:

THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

At a meeting held May 29, 1918, the following report was received and the resolutions therein adopted:

Your Committee on Nursing begs leave to submit the following report:

In view of the present inadequate supply of trained nurses and the great and increasing demand for them both for war work and in civil life; and in view of the fact that many persons in moderate circumstances, or on fixed salaries, with the present high cost of living are unable to afford the services of a registered nurse when ill; and in view of the fact that the present system of training and registering nurses seems to many members of our profession to have serious defects that may be remediable, your Committee recommend the following resolutions:

1. *Resolved,* That our delegate to the American Medical Association be instructed to ask for the appointment by that body of a committee to consider the whole question of training and registering nurses, with special reference to standardizing and simplifying the curriculum and requirements and the advisability of *establishing* a grade of practical nurses who, with a lower preliminary educational requirement and a much shorter course of training may be registered as attendants or practical nurses, and who shall receive a smaller compensation than the graduate nurse; such attendants or practical nurses to be used especially for chronic and convalescent cases and others not requiring the highest nursing skill, thereby relieving many graduate nurses for war work and critical cases in civil practice.

2. We also recommend that our delegate to the American Medical Association be furnished with a copy of this preamble and resolutions for use in the House of Delegates of the A. M. A. and instructed to urge prompt action with such arguments as he deems advisable.

W. P. Carr,
G. Wythe Cook,
I. S. Stone,
J. B. Nichols,
J. A. Gannon,
N. P. Barnes,
Frank Leech,

M. F. Cuthbert,
P. S. Roy,
G. N. Acker,
C. S. White,
E. Y. Davidson,
Committee.

Your committee desires to endorse not only the needs as expressed in the resolution, but also the necessity for the enlargement of all civilian training schools and necessary propaganda to secure a sufficient number of pupils for these. It recommends the adoption of the resolution and the appointment of a committee as suggested.

J. W. Schereschewsky, U. S. P. H. S.
H. P. Ritchie, Minnesota.
Frederic E. Sondern, New York.
C. D. Selby, Ohio.
J. R. Morrell, Utah.

Dr. Henri P. Linsz, West Virginia, moved the adoption of the resolution.

Seconded by Dr. E. J. Goodwin, Missouri.

After discussion by Dr. Thomas S. Cullen, Maryland; Dr. John D. McLean, Pennsylvania, and Dr. J. W. Schereschewsky, U. S. Public Health Service; Dr. Frederic E. Sondern, New York; Dr. P. S. Roy, District of Columbia, and Dr. George H. Kress, California, the Reference Committee substituted for the final paragraph of its report, which reads:

Your Committee desires to endorse not only the needs as expressed in the resolution, but also the necessity for the enlargement of all civilian training schools and necessary propaganda to secure a sufficient number of pupils for these. It recommends the adoption of the resolution and the appointment of a Committee as suggested.

the following:

Your Committee desires to endorse not only the needs as expressed in the resolution, but also the necessity for the enlargement of all civilian training schools and necessary propaganda to secure a sufficient number of pupils for these. It recommends the adoption of the principle of the resolution and that the resolution be referred by the House of Delegates to the Council on Health and Public Instruction with the following instructions:

1. That the Council on Health and Public Instruction appoint a subcommittee to consider this matter.
2. That this Committee consider especially the needs of the civic population with regard to nursing.
3. That this Subcommittee cooperate and advise existing nursing associations and other agencies concerned in this matter.

Whereupon the motion to adopt the report as amended by the Reference Committee was put and carried.

The Reference Committee on Hygiene and Public Health reports further that the following resolution had also been referred to the committee:

The Medical Society of the District of Columbia, at a meeting held May 23, 1918, adopted the following recommendation of the Executive Committee:

Whereas, The work of the American Red Cross is largely medical in character, and

Whereas, Modern medicine is largely dependent for continued progress on the use of animals for experimentation and in the course of treatment of disease, and

Whereas, The War Council of the American Red Cross, by reason of pressure brought to bear by certain misguided people ignorant of medical matters, has seen fit to issue the statement that it will not take a position either for or against the question of animal experimentation, and further has issued the statement that no money is to be taken from the General Red Cross Fund for this purpose, therefore be it

Resolved, That the Medical Society of the District of Columbia vigorously protest against such action by the Red Cross and its attitude of passive compliance with such demands concerning purely medical matters, and further be it

Resolved, That the Society state its belief that such persons who endeavor to arrest any aid that the medical profession is giving to our soldiers constitute a dangerous class giving aid to the enemy.

The delegate to the American Medical Association is instructed to ask the American Medical Association to take suitable action in this matter.

Your committee desires to fully endorse the sentiment of the resolution as undoubtedly in the best interests of humanity and medical progress.

As the Councilors of the American Red Cross have, however, found it expedient to act as they have, and we have the assurance that ample funds have been provided for essential research and no restrictions exist for the proper conduct of the work, your committee recommends that these resolutions be not adopted on account of any possible embarrassment to the Red Cross they might cause.

Dr. P. S. Roy, District of Columbia, moved as an amendment that the House of Delegates strongly endorse the use of animal experimentation for saving the lives of our soldiers and proclaimed all who are opposed to such animal experimentation belong to a dangerous class and aid the enemy.

Seconded by Dr. G. F. Cott, New York.

After discussion by Dr. H. M. Brown, Wisconsin; Dr. Thomas S. Cullen, Maryland; Dr. Alexander Lambert, New York; Dr. Torald Sollmann, Ohio, and Dr. John D. MacLean, Pennsylvania. Dr. M. L. Graves moved that the amendment be laid on the table.

Seconded and carried.

It was then moved that the report as amended be adopted as a whole.

Seconded and carried.

Report of Reference Committee on Legislation and Political Action

Dr. M. L. Graves, Texas, chairman, presented the report of the Reference Committee on Legislation and Political Action as follows:

Your committee has carefully considered the report of the Council on Health and Public Instruction. The enlistment of three of the five members of the Council in war service and the engrossment of the remaining two in state health work and cooperation with the federal Health Department has necessarily greatly restricted the activities of the Council; but the service rendered the public is still of importance and deserves our commendation. It is believed that the organization should be continued and proper appropriations made by the Trustees not only for the perpetuation of such work as may be done during the war, but for enlarged usefulness after the war. The public mind is now and will in all probability continue to be more receptive of health propaganda than ever before. The removal of physicians and nurses in large numbers from the communities of our country makes it imperative that health conditions be more carefully guarded, and we think the organization of home nursing and sanitation now being undertaken by many hospitals and women's organizations will be very helpful in public health education. Moreover, new and revolutionary processes of disease prevention and health protection are being constantly developed by the experiences of all the nations engaged in the war, and this information comes at a time of intense public interest and will find a more ready acceptance and adoption. The committee believes and therefore recommends that the work of this Council be continued as far as possible, and that sufficient financial provision be made therefor. Careful consideration has also been given to the three resolutions pertaining to women physicians introduced by Smith, Wetherill and Kress. The committee is of the opinion that the very character of military service and women's natural limitation for such service must require wise discrimination in their employment in war work. The principle of equal rank and pay for equal service is inherently just without regard to sex, and the committee feels this should be unhesitatingly approved by the House.

We therefore recommend that the resolutions offered by Wetherill as a substitute be approved with the following amendment. In the last paragraph use the words "Surgeon-Generals of the Army, of the Navy, and of the Public Health Service to authorize the employment of such unselfish women physicians in the service of the government in any of the many fields for which they are especially fitted by natural ability and training and that when so employed, adequate rank and pay be provided in every way equal to that of men similarly employed."

Resolution by Harris of New York pertaining to patent and trademark laws is approved.

Respectfully submitted,

M. L. Graves, Chairman,
A. E. Bulson, Jr.,
George H. Kress,
Southgate Leigh,
E. E. Harris.

Committee on Legislation and Political Action.

The committee appends thereto copies of the resolutions referred to in their report which were submitted, respectively, by Drs. Kress, Smith and Wetherill.

RESOLUTION INTRODUCED BY DR. GEORGE H. KRESS

Whereas, Women physicians in Great Britain, France, Russia, Serbia and Germany have performed invaluable services during the present war, services which have been signally recognized by their respective governments; and

Whereas, In the United States there was a large number of women physicians fitted and equipped to render equally valuable service, and to render service as efficient and valuable as can be rendered by men physicians, not only as anesthetists, radiographers, and hospital and laboratory directors, but also as surgeons, now therefore, be it

Resolved, That the Medical Association of the State of California express its desire that the American Medical Association do all in its power to further the utilization of the service of women physicians of the country as members in full standing of the Medical Section of the Officers' Reserve Corps and United States Public Health Service.

RESOLUTION INTRODUCED BY DR. E. O. SMITH

Whereas, There are at this time 5,124 women physicians in actual practice in the United States; these having graduated from recognized medical colleges and presumably qualified to practice medicine; most, if not all of them, having signified their readiness to do war work either at home or abroad;

Whereas, There are at present many women physicians, who have especially fitted themselves to do the kind of laboratory and research work for which the government is now fitting men at a great expense of time and money;

Whereas, The sixty-five American women physicians who are now working under the Red Cross in the war zone with many other women physicians from Great Britain, France, Russia and Italy have demonstrated that it is possible for women to endure the hardships of life in the war zone and still do creditable work;

Whereas, Our highest and most patriotic duty at this time is conservation, and the indiscriminate sending abroad of women physicians to do work other than under government supervision and direction is a pernicious waste of money, time and service; therefore be it

Resolved, That we, the members of the House of Delegates of the American Medical Association in session at Chicago, June 10, 1918, hereby recommend that the President of the United States, the Secretary of War and the Surgeon-General of the Army appoint women physicians to the Medical Reserve Corps of the United States Army on the same footing and with the same rank and pay as men.

RESOLUTIONS INTRODUCED BY DR. WETHERILL AS MODIFIED BY REFERENCE COMMITTEE

Whereas, The nation is at war and all our resources and energies must be devoted unreservedly to the winning of the war, wherever they may be made available, and

Whereas, Many of our women physicians have distinguished themselves by giving to the government and to the cause of humanity most unselfish and capable service in the fields of work for which they are particularly adapted and trained, and

Whereas, These critical times demand universal sacrifice and individual readiness to serve in any field in which one may be most useful regardless of official recognition or reward, and

Whereas, Thousands of loyal Americans are serving our country without adequate pay or appropriate place or rank, therefore, be it

Resolved, By this House of Delegates of the American Medical Association, that we wish to express our appreciation of the unselfish sacrifices so many of the women physicians of America are making, and, that we honor those who have so employed their skill and energy in our common cause; and furthermore be it

Resolved, That we petition the President of the United States, the Secretary of War and the Surgeon-Generals of the Army, of the Navy and of the Public Health Service to authorize the employment of such unselfish women physicians in the service of the government in any of the many fields for which they are especially fitted by natural ability and training and that when so employed, adequate rank and pay be provided, in every way equal to that of men similarly employed.

Report of Reference Committee on Reports of Officers

Dr. H. G. Wetherill, Colorado, chairman, presented the following report of the Reference Committee on Reports of Officers:

Your committee is prepared to make only a partial report on some matters, and as others are regarded of such great importance, we ask for more time to consider them.

Regarding the report of the Secretary, your committee desires to refer to a matter which has already been referred in this morning's session, namely, that which pertains to an Ad-Interim Committee. We find in the report of the Secretary under date of Oct. 19, 1917, the following report of the Board of Trustees was submitted by the Chairman of the House of Delegates and the Secretary to the Members of the House of Delegates of the American Medical Association and was adopted unanimously by a postal vote, 116 votes having been cast. The Secretary recommends that action be taken by the House of Delegates at its annual session to ratify this action of the Board of Trustees and to continue this committee with power to act for the Association in all matters pertaining to placing the Association at the service of the government.

Your committee recommends, therefore, the ratification of this action of the Board of Trustees, and I move that the ratification be made by the House of Delegates and the power of the committee be endorsed.

Seconded and carried.

In the report of the Board of Trustees we find several matters which we believe should be endorsed by the action of the House of Delegates. The Propaganda Department under the Board of Trustees with reference to quack advertising, and so forth, has commended itself to your committee, and we desire to recommend it to the House for endorsement.

Furthermore, with reference to the disposition of law suits, we think the Board of Trustees should be congratulated on the excellent results attained in the various law suits, particularly the Lydston suit, which has gone through the courts for a long time before it reached the American Medical Association, and we recommend that the House of Delegates approve the work of the Board of Trustees in this particular.

The most important of all is the work of the War Committee which the Board of Trustees has carried out. Your committee feels that the war work of the Board of Trustees has been very efficient, and we recommend for approval by the House of Delegates the report the Board of Trustees made regarding the work in connection with the war.

I move you, sir, that these recommendations be adopted by the House of Delegates, and that the Board of Trustees be commended for the excellent work done in these various particulars.

Motion seconded by George A. Moleen, Colorado, and carried.

It was moved that the report be adopted as a whole.

Seconded and carried.

Under the head of "new business," Dr. M. L. Graves, Texas, presented, at the request of William G. Priester, a communication relative to insignia for physicians' automobiles so as to distinguish them from other automobiles, and moved that the communication be referred to the Board of Trustees for consideration.

Seconded and carried, and the communication was so referred.

Dr. Rock Sleyster, Wisconsin, moved that the election of officers be held Thursday at 10 a. m. instead of in the afternoon at 2 o'clock.

Seconded by Dr. C. P. Meriwether, Arkansas.

Dr. Stewart R. Roberts, Georgia, moved to amend that the House of Delegates meet at 8 a. m. Thursday.

The amendment was seconded, accepted, and the original motion as amended was put and carried.

Report of Reference Committee on Miscellaneous Business

Dr. Charles E. Humiston, Illinois, chairman, presented the Report of the Reference Committee on Miscellaneous Business in regard to the following resolution offered by Dr. John Ridlon:

Whereas, The partial inventory of our national health made possible by the physical examinations under the Selective Draft Act showed a large percentage of our young men unfit for military service, and, further, that as most of these disabilities are curable, the American Medical Association is prompted to speak formally on this subject; and

Whereas, In view of the wonderful mental and physical benefits which have been manifested in the young manhood of America through intensive military training in the National Army cantonments; and

Whereas, Knowing that this training has done much to inculcate the knowledge and value of sanitation and personal hygiene in the individual; therefore be it

Resolved, That the American Medical Association in annual convention assembled urges the early adoption of a permanent national policy of universal military training for all young men before the right of suffrage is granted them.

Your committee recommends the adoption of this resolution.

It was moved and seconded that the resolution be adopted as recommended by the committee. Carried.

Regarding the resolution offered by Dr. Kelso, which reads:

Whereas, The medical profession of America is called on to do its duty inherent in those rights vouchsafed by our common constitution, with the innate idea and belief that our membership constitutes true patriatism and, that we as men of a high calling are entitled to equal standing with the profession in all parts of the world; therefore be it

Resolved, By the American Medical Association, the representative organization of the one hundred and forty thousand physicians of America, that we unqualifiedly endorse the proposed Medical Officers Law now before Congress, known as the Owen-Dyer bill, and urgently request its immediate enactment into law.

Your committee recommends that this resolution as rewritten be adopted, namely,

Whereas, The medical profession of America has been called on to do its duty in the present crisis and

Whereas, The physicians of America are entitled to equal standing with the profession in all parts of the world, therefore be it

Resolved, By the American Medical Association, the representative organization of the physicians of America, that we unqualifiedly endorse the principle of the Owen-Dyer bill, and request Congress to take prompt and favorable action on this measure as it has been framed by the Senate Subcommittee.

I move its adoption.

Seconded by Dr. G. F. Cott, New York.

After discussion by Dr. H. M. Brown, Wisconsin; Gen. Robert E. Noble, District of Columbia, and Dr. Miles F. Porter, Indiana, the amended resolution was adopted.

Dr. Thomas S. Cullen, Maryland, offered the following resolutions and moved their adoption:

To the President of the American Medical Association and Members of the House of Delegates:

The following resolutions are herewith submitted for your consideration:

Whereas, In accordance with Army regulations, Major-Gen. William C. Gorgas, now Surgeon-General of the United States Army, will reach the prescribed age of retirement in October, 1918; and

Whereas, By virtue of his scientific attainments and his statesman-like vision he has proved himself eminently qualified not only to meet the extraordinary exigencies of the present situation, but also to plan with great foresight for the future development of the Medical Department of the Army; and

Whereas, By his conduct of affairs and by his character as a man he has gained the admiration and complete confidence not only of the medical profession of the country but of the civilian population as well, be it therefore

Resolved, That it is the sense of the American Medical Association, now in session in Chicago, Illinois, that it would be for the best interests of the nation, if General Gorgas be continued in his present office as Surgeon-General of the United States Army, and be it further

Resolved, That this expression of appreciation and confidence be communicated to the President of the United States.

Motion seconded by Dr. Wilmer Krusen, Pennsylvania, and carried.

Report of Reference Committee on Miscellaneous Business

Dr. Charles E. Humiston, Illinois, chairman, presented a report of the Reference Committee on Miscellaneous Business in regard to the resolution offered by Dr. M. L. Graves, Texas, which reads:

Resolved, That the House of Delegates of the American Medical Association is opposed to the use or prescription for use of all drugs, chemicals, medicines, medical and surgical instruments and supplies of German or Austrian origin or ownership. That the medical profession be urged to cease their purchase or use, and

Resolved, further, That the medical and lay press of America be requested to discontinue advertisements of all such articles to the profession and to the public.

Your committee recommends the passage of this resolution, and I so move.

Seconded by Dr. Wilmer Krusen, Pennsylvania.

After discussion by Drs. Torald Sollmann, Ohio, and Charles E. Humiston, Illinois, Dr. H. Bert Ellis, California, moved that the resolution be laid on the table.

Seconded and carried.

Dr. J. B. Blake, Massachusetts, offered the following resolution. The house suspended its rule, and, on motion duly seconded and carried, adopted the resolution.

Resolved, That the House of Delegates of the American Medical Association is in sympathy with and endorses the general outline of the plans of the Surgeon-General for the creation and operation of an army school of nursing.

Dr. V. G. Vecki, California, presented a resolution relative to establishing an undergraduate class of medical students, which was referred to the Reference Committee on Legislation and Political Action.

Dr. W. T. Wootton, Arkansas, presented the following preambles and resolutions, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Whereas, We recognize the liberty enjoyed by the practicing physician of today in that he may follow along broad lines in the management of the sick entrusted to his care and that we would not deprive him of one iota of that liberty; and,

Whereas, We believe that the mobilization of our Army and the experience of the hospital units show it to be to the best interest of the patient that he receive at all times a more uniform treatment, one recognized and endorsed by the best medical minds of today; and

Whereas, At present there is no committee or council within our ranks to give such endorsement; therefore, be it

Resolved, That the President of the American Medical Association, the Chairman of the House of Delegates, with the chairmen of the various sections be and they are hereby appointed a standing committee to select a Council on Standardizing Surgical Procedures and Medical Practice, the number and personnel to be entirely at the committee's discretion, power being hereby given them to fill vacancies or enlarge said Council as necessity may demand; and further appoint an Advisory Committee to said Council should they desire. Be it further

Resolved, That no action of this Council shall be deemed binding on any physician or surgeon, that no effort shall be made to foster any creed, sect, dogma or other stigma; the object being strictly to weed out fallacies, gather data, and give the profession an unbiased report as to efficacy of procedures in order that we, the rank and file, may not linger in doubt as to what may be considered judicious, conservative practice.

Dr. Torald Sollmann, Ohio, offered the following resolution, which was referred to the Reference Committee on Miscellaneous Business with the request that the committee report on it as soon as possible:

Resolved, That the American Medical Association calls on its members to further the conduct of the war by confining their prescribing to products owned and manufactured by loyal citizens of this country or of our allies, whenever the interests of the patients permit.

Dr. Charles E. Humiston, Illinois, chairman, reported that the Reference Committee on Miscellaneous Business recommends the adoption of the resolution offered by Dr. Sollmann, and he so moved.

Motion seconded by Dr. Lewis S. McMurtry, Kentucky, and carried.

Dr. Southgate Leigh, Virginia, presented the following resolution:

In order that the tabling of the resolution offered by Dr. Roy in regard to animal experimentation shall not be misconstrued by the press and others, it is moved that the Reference Committee on Hygiene and Public Health should be instructed to frame and present a resolution reaffirming the belief of this Association in the efficacy and necessity of animal experimentation.

The chairman stated that the committee would be so instructed.

It was moved that the chairman of the House of Delegates be authorized to transmit to the proper reference committee any resolution which may be received from the sections prior to the meeting on Thursday morning, so that the committees could bring in such resolutions to the House of Delegates for action.

Seconded and carried.

Dr. J. W. Schereschewsky, U. S. P. H. S., moved that in view of the fact that industrial medicine and surgery is now a definite branch of medicine, the question of proper designation of industrial physicians and surgeons be referred to the Reference Committee on Sections and Section Work for a report on Thursday morning.

Seconded and carried, and the motion was so referred.

On motion, which was duly seconded and carried, the House of Delegates adjourned until 8 a. m. Thursday.

THE SCIENTIFIC ASSEMBLY

THE OPENING GENERAL MEETING

Tuesday Evening, June 11

The opening meeting of the Association was held in the Auditorium theater and was called to order at 8:15 p. m., by the President, Dr. Charles H. Mayo, Rochester, Minn.

Dr. John Timothy Stone delivered the invocation.

Almighty God, our Father in Heaven! Thou who art guiding this nation, and Thou who hast guided this nation, as history has spoken, we thank Thee for what Thou art, and for what Thou hast been, and for what Thou art to be. And we thank Thee for our land with all its splendid enthusiasm for righteousness, justice and truth, and all the splendid power, all the freedom of the heart and conviction of soul; for that which is true and godlike. And now tonight as this assembly meet together in this our city, and as we welcome them in the spirit of gratitude and earnest, thoughtful pride, we pray that Thy blessing may be with all of their deliberations and that their good effect may extend even to France, and to the uttermost parts of the world. We thank Thee that the love of service belongs with the heart of faith. We thank Thee for the courage and for the skill and the faithfulness and the patience of the men of medicine and surgery whose life is not held dear in any cause where they may give their service and their heart to the nation and to the nations warring in the strife for freedom. O God! We thank Thee for what they are with the men at the front. We thank Thee for what they are with those who are training here at home. And we do pray, O God, at this time a signal and earnest devotion to our country, of honest and holy patriotism; that they may prove that we as a people in this land are grateful to Thee, Almighty God, for the service and the devotion and the faithfulness of these men who are doing so much today to make our cause a permanent cause, and to make the lives of our sons and the life of this nation all that Thou wouldst have it. And, O God, we close our petition with this great world prayer: We do not ask Thee, Almighty God, to be on our side. But we pray Thee, Eternal One, that we as a nation, and our allies may more and more, in the cause of freedom and righteous liberty, be on Thy side, where Thou hast placed us. And O God, be with us as we unite in the prayer that the Great Physician, Thy Son, taught us:

Our Father who art in heaven, hallowed be Thy name. Thy kingdom come. Thy will be done on earth as it is in heaven. Give us this day our daily bread, and forgive us our trespasses as we forgive those who trespass against us. Lead us not into temptation, but deliver us from evil. For Thine is the kingdom and the power and the glory forever. Amen.

Before the opening of the meeting the distinguished visitors from abroad, the ex-Presidents of the Association, the Surgeon-Generals of the Army and Navy and other government officials, together with the physicians in uniform, including the physicians' band from Fort Reilly, occupied the stage. The national anthem was played by the band while the audience stood, the officers at salute.

Addresses of Welcome

Dr. E. W. Fiegenbaum, president of the Illinois State Medical Society, was introduced, and welcomed the members on the part of the profession of the state.

ADDRESS OF WELCOME BY DR. E. W. FIEGENBAUM

Mr. President, Fellows of the American Medical Association, Ladies and Gentlemen: The medical profession of the great state of Illinois sends you a most hearty greeting. Speaking in their behalf and in behalf of the organized medical profession, I bid you a most hearty welcome. We are not all here tonight. Nearly 2,000 of the foremost medical men of Illinois have volunteered in the service of their country. (Applause.) They have commissioned me to speak for them this evening. They have projected themselves over thousands of miles of land and water and are here with us tonight in spirit, giving you their greetings. They are in the camps and cantonments in this country. They are on the battleships and transports on the high seas. They are in the base hospitals, and on the firing line "over there," each one in his own way doing his duty by his country in a medical way. They have left their families and their homes; they have left their business interests; they have left the prominent places that they have occupied in their respective communities and have gone to the front, eager and anxious to serve the government when it called; they have left safety and security and are braving disease and death. All hail to the medical profession that has laid its all on the altar of its country. (Applause.)

It is very appropriate and pleasing to us of this state that your annual meeting should be held here this year, for this is our centennial year. All over the broad prairies of this state great preparations are being made to celebrate this event in a befitting manner. But medicine in this state is older than that. The nineteenth century was only 2 years old when in 1802 Dr. George Cadwell left his home in Kentucky, came down the Ohio River and up the Mississippi River, and landed in Madison County, Ill., just opposite the present site of St. Louis. He at once laid the foundation of organized medicine, because we find that this state was only about 4 years old when the first medical society was organized, and a little later on we even find an attempt made to register the physicians and surgeons of the state, foreshadowing our present registration and education. Those old pioneer physicians worked faithfully and hard. They upheld the banner of scientific medicine to the very best of their ability, and to the standard of scientific knowledge which they had at that time. Following this came decade after decade of their worthy successors, always upholding the principles of scientific medicine, upholding the standard of physicians practicing in the state of Illinois; and it can be truly said that at no time was there any state that exceeded the state of Illinois in its organized medical profession.

With the dawning of the twentieth century greater steps were taken; more earnest efforts made, eradicating medical schools that were not up to the standard and purifying these schools by consolidation and elimination. (Applause.)

The latest achievement of the medical profession of this state was to give us through the legislature one of the best medical practice acts found in any state. We find the medical profession always laboring faithfully and hard to uphold and to increase the standards of medical education at all times. These are the men we represent; these men that laid the foundation; these men that built on that foundation and erected this magnificent superstructure; these men, who, guided by high ideals, will carry the banner of organized medicine and put it on the highest pinnacle; and it is not only a possibility, but it is almost an assured probability that these men will, in the near future, bring within the confines of this state the medical center of the universe. (Applause.) These, ladies and gentlemen, are the men who have bid me to say, "You are Welcome." (Applause.)

President Mayo then introduced Dr. Charles E. Humiston, president of the Chicago Medical Society, who delivered the following address:

ADDRESS OF WELCOME BY THE PRESIDENT OF THE CHICAGO MEDICAL SOCIETY

Chicago is proud to be host to such distinguished company. This is the home town of the American Medical Association. There is perhaps no city on this continent that does not in some degree share in this honor, as this greatest of all medical organizations is literally at home everywhere, but it is more at home in Chicago than in any other city.

The American Medical Association ranks high among the resources of the country. It is the one great comprehensive democratic medical body to which every reputable physician may belong and for the most part does belong.

As the individual turns to his physician for relief from the common ills of life, so the nation, in its present time of peril, in confidence is depending vitally on its physicians, on the organized medical profession, the American Medical Association, and in this confidence the nation will not meet disappointment.

Three thousand and more members of the Chicago Medical Society greet you with a cordial welcome. The shades of its former presidents, the immortals, Davis, and Senn, and Fenger, and Murphy, look down with favor on your coming and join with the guiding living spirits of the present, Quine and Billings, in bidding you Godspeed in your noble work.

The Chicago profession trusts you will find its atmosphere conducive to achievement, an atmosphere just now surcharged with every form of activity that should characterize a community wholly awake to its proper part and place in the world's war for decency in which we are now engaged.

Our members are not all here to greet you. Many are now engaged in building and conserving the military strength of our beloved country, and not a few who were thus engaged have already gone beyond the zone of combat to the "undiscovered country from whose bourne no traveler returns." May their sacrifice and their example inspire us to renewed endeavor.

Eminent visitors from afar, from Belgium and from France, from Great Britain and from Italy, from Australia and from far away New Zealand and nearby Canada: Chicago extends to you the right hand of fellowship. We stand by you. We stand with you; and now while the stars in our service flags are turning from blue to gold, we pledge again our allegiance to the cause you represent.

And to the Fellows of the American Medical Association, from the youngest recruit just faring forth, to the illustrious Surgeon-Generals of Public Health, of the Navy, and of the Army: Welcome! Chicago is proud to be host to such distinguished company.

Mr. Bob Dyrenforth sang "Keep the Home Fires Burning," accompanied by the band.

President Mayo in a few felicitous phrases in each instance framed and oriented for the audience the distinguished home and foreign visitors present at the meeting and occupying the stage, who were received with tremendous applause from the large audience. They were, in the order of their presentation, Surgeon-General Gorgas of the Army, Admiral Braisted, Surgeon-General of the Navy, Sir James Mackenzie of London and Scotland, Sir William Arbuthnot Lane, England, Major Rist and Major De Helly of France, and Colonel Bruce, representing Canada.

Hon. Frank O. Lowden, Governor of Illinois, was introduced and said:

ADDRESS BY THE GOVERNOR OF ILLINOIS

Mr. President, Distinguished Representatives of Our Allies and the Champions of Civilization, Members of the Medical Association, and Ladies and Gentlemen: It is a very great honor which you and your organization, Mr. President, have conferred on me tonight. Never, I suppose, in the history of this country has so distinguished a body of the medical profession been gathered together as in this hall tonight. (Applause.)

It is not only an honor which we appreciate, but it is an honor which I covet, because I want to say to the American Medical Association that we of Illinois are under very great obligations to the Association. During the last eighteen months we have been reorganizing the health agencies of our state to the end that we might enlarge their scope and increase their efficiency. In every step we have taken we have had the hearty sympathy and cooperation of the American Medical Association. And when we have sought to elevate the standards of the profession they again have assisted us. I have discovered from time to time that whenever any man in our state thinks he has a constitutional right to practice medicine, provided only he frequented some place, somewhere, with the magical words "medical college" written above the door, that man is against your Association. (Applause.) And again, when some of our citizens who have a license to practice medicine feel that it gives them the right to prey on the helpless and the unfortunates of society, those men have been against the American Medical Association. (Applause.)

It is a great pleasure tonight to admit the obligation under which Illinois, the whole country and the civilized world are to the medical profession of America for the unselfish way in which, forgetful of all selfish interests, it has thrown itself heart and soul into the greatest war the world has ever known. (Applause.) I am here tonight to explain to you why it is that the American physician and surgeon has been so keen to appreciate the significance of this colossal conflict. He is different from the German professional man because he has never come under the influence of "kultur." He is still simply under the influence and guided by the old fashioned thing we call civilization. (Applause.) And sometimes I think that we of America, as well as our allies, do not dwell enough on the contribution which our scientific men have made to civilization, and they are likely to take far too much for granted of the claims which the autocratic central powers make. I want to remind you tonight that "kultur"—I do not know whether I can pronounce it right—I hope I may never learn it well enough to practice it—(applause) is based on the theory of an English scientist; the whole doctrine is based on the biologic law of the survival of the fittest. But while that was an Englishman's philosophy and invention, the Germans misapplied it when they brought it into their own country. The Englishman knew that while it was a correct law of biologic existence, the law of the survival of the fittest, they also knew that that law did not respect the moral and spiritual laws of the universe, which in the end control the physical laws. (Applause.) The Germans adopted this law in their philosophy and then announced that not only were the strong alone to survive, but that they were to rule the world. They then discovered that what we call moral laws have become outgrown, and they developed their superman. But all the while the scientists of the rest of the world knew that that law had *nothing* to do with the law of right and wrong. All the rest of the world knew that the moral forces they understood were the final arbiters of the universe and that therefore the "kultur" of the German is but a materialistic philosophy founded on a half truth, and was possible only by the exclusion of other truths. (Applause.) But to the physicians of England and Scotland, of France and Italy and to American physicians—not the physicians of Germany—but to the physicians of the rest of the world the biologic truth meant to them that it was their duty and only by removing the causes of weakness and disease, by improving the environment, by aiding and tenderly protecting the weak and lifting them up, could they give expression both to the moral laws of the universe and to the biologic laws. That is what they have been doing all these years, while "kultur" applied to simple man destroyed the weak, destroyed the unfortunate, blotted them out of existence, and thus made the superman supreme. That is the difference that has come in the last half century in the development of "kultur" as compared with our own civilization. (Applause.) So tonight it is a great pleasure to be here to honor that noble profession, because not only does it regard the physical, but it tenderly ministers to the mental and the moral. It is busy all the while in devising ways and means by which the weak may become strong, by which those who fall may be made to stand; in other words, the physician of civilization, as contrasted with the physician of "kultur," shares with the minister of religion in the tenderest ministry which comes to the human heart and the human home. (Applause.)

I was very much interested in what was said about the number of physicians who are engaged in this war, and it heartened me more than anything else, because with that thoroughness which has distinguished the Germans they have methodically and precisely rated the value of every man engaged in the service. They found that a physician is the equivalent of 500 men in the ranks. The American Medical Association is going to contribute something like 40,000 of its men to the Army, and a simple calculation will show that the Association will contribute to the war the equivalent of 20,000,000 men. (Laughter and applause.) If these men are directed by the genius of General Gorgas we know what the results will be, because this is not the first enemy that General Gorgas has met. (Applause.) I refer to his work on the Panama Canal. His enemy there was not Germans, but mosquitoes, but they are very much alike in many respects. (Applause.) They have the same notions precisely of the rules of civilized warfare. And the mosquito is *no* enemy to trifle with. The mosquito in the past in Panama succeeded in doing what the German armies have not done *in* four years, and that is that the mosquitoes of Panama drove the French out, but the French so far have held the German armies. (Applause.) And when I speak of France it is always reverently. The great masters of French romance have delighted the world for generations with *their* marvelous creations; but not one of her great masters of romance has ever written pages one-twentieth as thrilling as her soldiers in the field have written in fact during the last four years. (Applause.)

And now another difference between the civilization of the allies and the "kultur" of the central empires: It is true that "efficiency" is the word that is oftenest on our enemy's lips, and it must be admitted that they appropriate the inventions and discoveries of other countries with consummate skill and with fine results. But after all it is the free countries, it is France and England and Italy and America that have made these discoveries. I read this evening that smallpox had broken out in the Krupp works, and today they are vaccinating these men. They are vaccinating their population, not with anything that they discovered, but because of the discovery of a great English physician, Sir William Jenner. And the anesthetics with which Germany soothes her wounded and dying soldiers were not the discovery of German scientists, they were the discovery of American scientists. Again, the only thing that has enabled them to keep up this war so long was another discovery of the modern antiseptic treatment of wounds, and that again was not found by German "kultur," but was the discovery of an English physician and scientist (Applause.) And so they have been able for four years to hold the world at bay because of the discoveries which free professional training and genius have given to the world. They have taken these products of civilization and with them they seek to destroy civilization itself.

I read last night, and I read with a good deal of feeling, the statement made by Dr. Esther Lovejoy, a physician who has recently returned from France, that Germany did not take the women who were mothers of two children back to their land or under their care, because they only wanted children and mothers of children with German fathers; and that statement I have no doubt is true and is justified by the "kultur" which they have been preaching for forty years. Because if all that is needed is strong men physically, if in the end the world is to belong to might and might alone, and if "kultur" must be made to spread around the world before the stream is clear, why is it not logical and consistent? If they have the courage of their convictions, the thing to do would be to take the defective, the deformed and the helpless and exterminate them, because in that way they will have a stronger race of men, and they have learned that they cannot impose their "kultur" on foreign races. Just as sure as they win this war Germany will not attempt to convert the people of other races to their "kultur"; they will exterminate the men and reduce the women to slavery in order to make "kultur" triumphant around the earth. That is the logic of the most damnable philosophy that has ever been evolved from the brain of man. The one single notion in the kaiser's savage brain, so deadly to everything in civilization that we hold dear, is this "kultur" which, if they win this war, will overshadow and shock the world. I want to tell you that if they win—and I am speaking with all the seriousness with which I ever spoke in all my life—the superman, the German, will become the superfiend of all the rest of the world. (Applause.)

I saw the other day that our government had discovered circulars of propaganda in Spain to intimidate that nation against entering the war. They gave out a statement of what was done to Belgium, because they said Belgium was foolish enough to fight after she had been beaten; and they recounted all the things they had done to France. They catalogued the spoils they had taken *in the war; not simply military spoils*, but watches and spoons and *other articles of domestic use*. I recall that they *classified the articles—so many first class* watches, etc. That is *German thoroughness*; that is "kultur" *practically* at work in the field. And so many spoons. And they closed the list with the statement that they had also captured over 500,000 bottles of champagne. They went on with another list containing the churches and cathedrals they had destroyed; and I could *not* help but say of that list, "How logical and thorough these wonderful people are; they capture and keep the spoons and the champagne, and they destroy the churches and cathedrals." And why should they not? Every church with its spire pointing heavenward was a rebuke to their materialistic creed, to the people who had plundered for centuries men, women and children who sought sanctuary and quiet and inspiration. Every cathedral that was standing was an act of reproach to that German god whom they worship and whom they have brought out of the dark German forests of 2,000 years ago. So, if we only know what this war means, we will win it. (Applause.)

We have had dark days, indeed; and I want to say in this presence tonight that the darkest hour to me came a few weeks ago in the thought that the gallant English and the gallant French armies would be separated and destroyed. It was the darkest hour for this reason and for this reason alone: We not only might have lost all; England and France would, too, have lost all—all but honor and the privilege of dying free men rather than to live slaves—and the thing that depressed me was that America was not there with a million men to stand between the heroic English and French armies. While we would have lost no more than they, they would have had the supreme satisfaction of knowing that they had done all they could and those that died had sought an honored grave rather than a cowardly peace. (Applause.)

Now that that danger is past, we still are confronted with dangers many and great. I do not know as I speak what the fate of our allied armies is tonight. It may be, so far as I know, that these horrid huns will reach and seize and despoil Paris. What then? We shall go on. (Applause.) I do not believe they will, but it may be that they should succeed in separating the English from the French; but if they do (which God forbid), and they drive the English forces into the Channel, and if they annihilate the French army before the campaign is over, England, France, Italy and America will still go on. (Cries of "Good," and applause.) Germany may seize the body of France, but never her indomitable soul. We will all go on until justice comes, and until this horror, war, is for all time put to rest. (Applause.) If I have any influence with my people I want to say that not only would these catastrophes not end the war, but even if—which we cannot believe—the German fleet should sail out some night and destroy the allied fleet, we still would go on, because the spirit of France and England and Italy and America still would live. (Applause.) And if Germany under her piratical flag—and I use that term advisedly: she ran up the black flag of the middle ages—if these fleets under the black flag entered the harbor of New York and conquered that beautiful metropolis of the new world, still the spirit of England and France and Italy and America would go on, and I want to say that for myself there is no point that can come, there is no reverse which can be met by our armies, which can conquer us, because we now have, we shall have, and in any crisis that may come we shall fight and die like men. He who would not die like a man rather than live a slave has no place in any of these United States.

Just one word more: You will hear from now on insidious whispers of peace; but listen not. Russia! Russia was seduced by the word, and you know what happened to Russia. Russia at peace with Germany has suffered worse than she ever suffered at war, and so would we, and so would all the world, until a peace can come by victory and victory alone. (Applause.)

When they talk to us of peace with these crimes unrepented, when they talk to us of peace and there is no possible guarantee of peace, let us heed them not. Do you know what I think we shall tell them? I think we shall say, "Go and tell that to the marines," and they know now where the marines are and that the marines will be the American answer to their insolent proposition. (Applause.)

President Mayo said: It is a great honor to be president of this Association, and that honor I feel slipping from me, and feel that it will wholly slip away in about eight minutes.

Before terminating my office, I wish to speak briefly upon some of the phases of the world's topic in its relation to medicine. The part played by medicine has never been recognized as so responsible as it is today. The Medical Department of our Army in surgeons, enlisted men, nurses and aids numbers over one-tenth of the Army. I believe it is conceded as the best organized of any department in France. The work of organization was begun a year before war was declared, and the wonderful results of the work of organized medicine in the protection, prevention of disease, care of wounds and sickness with the salvage has never before been approached even in civilian life.

The peculiar type of the warfare conducted for the past four years has been scientifically dealt with by medicine from every angle, and while spectacular heroics are noted in the Army in small combats and large drives, they are the everyday portion of the medical department as the doctor carries on his routine work.

The National Medical Museum is now a comparatively small institution, barely existing on the meager appropriation of $10,000, lacking in index, supplies and general educational phases. It, however, can be made one of the greatest institutions for medical instruction in the country. Very early as we entered war, the written medical and surgical history of it was planned, and later a committee was formed by the Executive Board of the Council of Defense to develop the tangible medical and surgical records of the war for the National Medical Museum, under the Surgeon-General, the collection of specimens, types of weapons, missiles and the kind of wounds created by them, and the destruction made by each. This committee consists of myself as chairman, Colonel William Welch and Colonel Victor Vaughan as committeemen, with Colonel Owen, the curator of the Museum. The committee appointed Dr. Louis B. Wilson as Foreign Director of the work. There are artists, plaster and wax workers, also moving picture apparatus connected with this historical work representing the care of the soldiers, the prevention of disease, the surgical care of injuries and salvage of our casualties.

It is proposed that in the reorganization of the Museum that the double-headed monsters and curious anomalies of human form will be relegated to an inner room for medical study only, while the wonderful work in sanitation and hygiene, the protection and care of babies, the care of industrial workers will be shown in the main room.

What of the future of medicine in Europe? England has just started her medical schools with a limited number of students after they were closed for four years. France has not yet re-established her medical schools. After the war, is Germany and Austria to again become the European center for medical instruction? It is to be hoped, at least, not until it is earned. We are now raising funds with which to establish a Postgraduate Medical School in Paris under the auspices of an American Board to give the final training to our medical officers when sent to France. It is hoped the school can care for upwards of 1,000 surgeons. A third of the institution would be turned over for the use of France and two-thirds would be placed under the control of the Surgeon-Generals for the period of the war. There would be given the last word in military medicine. At the close of war to be presented to the medicine of France by the medicine of America as a permanent Postgraduate Medical School and headquarters for all nations. It is expected the institution will be connected with several of the larger hospitals and become the coordinating center for development of the National Medical Museum, Research Work, School of Language, etc.

Concerning medicine in our own country, it looms large and never was on such a safe foundation. In Washington, however, it is divided into many bureaus and boards, overlapping in responsibilities and duties. Yet, each is permanent as they are supported by funds or appropriations. The greatest is the Public Health Bureau under the Treasury Department, under Labor is Care and Protection of Industry and Child Welfare, under the Department of the Interior is the Care of the Insane not otherwise provided for and other activities, under Commerce is Census and Statistics, including Mortality Records, under Agriculture are the Pure Foods and Drugs activities, and there are many other smaller boards and bureaus, almost too numerous to mention.

The future goal of medicine, the establishment of a National Bureau of Health, to coordinate and centralize these great problems which so largely govern the health and happiness of our people will surely come, with the aid of the organization of medicine now developed, at the close of the war.

After the singing of America, led by Mr. Bob Dyrenforth, Chairman Mayo in introducing the President Elect said:

I wish to introduce to you one of the great surgeons of this country, a man who is known to us all for his surgical work, but whom we think of possibly more for what he has done in organizing medicine in the advanced position it occupies in this country today. I now present to you your next President, Dr. Arthur Dean Bevan.

Dr. Bevan read his address.

THE FOOD OF THE ARMY

One reads everywhere in the public print about the energy needs of our citizens and about ways in which the requisite calories of food fuel can be adequately supplied with due regard to the economies and sacrifices demanded by the food situation. Little mention is made, on the other hand, of the food problems of the great armies at war or in the course of training. In the minds of an untutored public our soldiers are thought of by many either as fed to satiety with a lavish liberality that is supposed to represent a government's way of gaining fighting results, or as subjected to dietary privations that represent real hardships. Army life, until recently, has been so far removed from the sphere of information of the average civilian that his conjectures of the rationing of groups of men in uniform have had little real experience as a basis.

Interesting official statistics have lately been made available from the Food Division of the Surgeon-General's Office of the War Department by Major Murlin.[1] It appears from these that our troops have the most liberal allowance of food among all the Allies' rations. The United States garrison ration calls for 4,600 calories; indeed, in the so-called modified garrison ration, 4,800 calories are provided. Among the food quota allotted to the British, Canadian, French and Italian troops the highest does not exceed 4,200 calories, the estimated value of the British field and trench ration.

Thanks to the unique food surveys now being made by the Food Division of the newly established Sanitary Corps, the average actual food intake in the training camps has been ascertained with considerable accuracy. The data from eighty-seven messes show a consumption of 4,000 calories a day, thus distributed between the groups of nutrients: proteins, 14 per cent.; fats, 30 per cent.; carbohydrates, 56 per cent. On this diet, supplemented by a certain consumption of food from the camp exchanges, the men, according to Murlin, have gained in weight, on an average, about 9 pounds since entering the training camps.

These figures indicative of an adequate energy allowance, to say the least, for the American soldier under the present regimen, deserve to be compared with statistics in related situations. A study of the dietaries of 110 families has indicated somewhat less than 3,200 calories as the energy allowance estimated on a "per man per day" basis. Of course the food requirement bears an inevitable relationship to the nature of the occupation or muscular activity of the individuals concerned. The American farmer — a worker of average intensity — is usually credited with a need of about 3,500 calories a day. The average actual food consumption gathered from 18,000 observations among munition workers in England, in 1917, was reported as 3,463 calories. There is, accordingly, no occasion to assume that the present ration of our forces in training is not liberal, from the standpoint of its energy content. The same feature of abundance characterizes its content of protein. Murlin's report indicates that whereas the British army allows 1 pound of meat per man per day, the French army ¾ pound, and the Italian army only ½ pound, our allowance is 1½ pounds. However, the actual consumption by our army up to the present time in the camps of this country does not exceed ¾ pound.

Much has been said about the subject of food waste in the camps and cantonments at a time when our civilian population is making great sacrifices in the direction of food economies. There has, undoubtedly, been a modicum of truth and likewise a measure of exaggeration in the statements circulated through hearsay reports. Without condoning any offense in this direction even in the early stages of large army organization — or lack of organization — there is reason to believe that such wanton waste has been reduced to an insignificant point. Conservation is being practiced under the critical supervision of the officers in charge. Not only a system of garbage inspection, but even the examination of the individual's dinner plate has been put into operation.

Even now, after only a few months of actual organization, we have, according to Murlin, the first instance in the history of warfare in which the actual amount of food consumed is estimated directly in the camp and in the field where the troops are operating. It is comforting just now, the nutrition expert of the Surgeon-General's Office reminds us, to remember that the status of the science of nutrition in America is fully equal to its status in the land of our enemies at the beginning of the war. If we fail in the trial that is on us, it will not be for lack of information. If we fail, he adds, to keep our civilian population properly nourished, it will not be because we do not know the functions of food, or because we do not know what foods are suitable. Likewise with the army.

CORN IN THE WAR TIME DIETARY

In the shortage of wheat, which is likely to remain serious for some time to come, we shall inevitably turn for a substitute to corn, or maize, the cereal that is most abundant in this country. In practice, the admonition to "save the wheat" will be coupled with the inevitable necessity of eating something else. Corn is produced in such large quantities in the United States that only one sixth of the crop need be eaten in order to replace or save one half of the wheat crop. A recent writer[1] has stated that, if consumed as human food, a fifth of the total corn crop, or a third of what is suitable for milling, would set free all the wheat needed for our friends abroad and leave enough corn on the farms for the adequate feeding of all the live stock now on hand.

What are some of the objections urged against corn, both here and among the Allies? The foremost one, perhaps, is that of palatability, a feature associated with the culinary aspects of the diet. There is evidence on hand that the new interest in all win-the-war activities has given an impetus to the improvement of the cookery of corn products. Despite the aversion of the human palate to innovations in diet, it is not at all unlikely that the near future will see corn foods gaining widely in popularity throughout this country, in the southern parts of which they do not need any recommendation even now.

Another objection that has been urged concerns the quality of the protein and the deficiency in the inorganic salt content of corn. These factors might represent a real difficulty if maize formed the sole or even the major portion of the diet, as it sometimes is made to do in the ration of some of the domestic animals. One-sided dietaries, derived from single sources, are likely to prove inadequate in some details; but so long as the admonition to vary the intake and to use well selected supplements is not forgotten, this liability to harm is no greater with corn than with many other single foods. That man cannot live by bread alone is literally true.

Lately there have been reports of digestive disturbances attending the liberal use of corn in the diet. According to Sherman[1] as well as other observers, the exclusion of this difficulty, magnified perhaps by an apprehensive public, lies in proper cooking. Referring to the experiments in the laboratory of food chemistry at Columbia University he says:

> It is evident that corn meal, suitably cooked, can be substituted for corresponding wheat products even to an extent equivalent to the whole of the usual consumption of wheat in the dietaries of those who live largely on bread, without detriment to the nutritive value of the diet. When conditions are unfavorable or the subject is particularly sensitive to a change of food, a considerable substitution of corn for wheat may give rise to some discomfort in digestion; but in the three cases here observed, the nutrition of the body tissues appeared to be as well maintained as when the digestive process was entirely regular. It is confidently believed that suitably cooked corn products can enter into the dietary, even of those not accustomed to their use, in large proportion without any effect whatever on digestion. Nor need the palatability of such a diet suffer when even greater quantities of corn products are introduced in varied forms.

Above all, we need at this time to dispel the fear that corn and pellagra have a direct etiologic interrelationship. To quote Sherman again: If pellagra is due to faulty diet, the fault lies not in the use of corn, but in the fact that the diet contains too little of foods of other types.

FACTORS IN THE REGENERATION OF BLOOD

The factors that determine the regeneration of the blood after hemorrhage have by no means been satisfactorily ascertained. In some types of anemia, obstacles to the maintenance of the integrity of the red corpuscles undoubtedly exist. Hematolysis here plays an important part. In chlorosis the characteristic feature of the blood is the relatively small amount of hemoglobin in proportion to the number of the corpuscles. Apparently the fault lies in defective hematogenesis — in the inadequate manufacture of blood pigment rather than in either a destruction or a deficient formation of corpuscles. A few years ago the favorite hypotheses involved the part taken by iron in the formation of hemoglobin. But persistent lack of blood pigment in many cases certainly is something more than the expression of lack of iron; for iron therapy fails to produce the desired hematopoiesis in many instances.

It would seem most rational, as a preliminary to the attempted unraveling of the secrets of such complex pathologic conditions, to learn first of all what is involved in the more fundamental process of blood regeneration in simple anemia such as exists after uncomplicated hemorrhage. Whipple and Hooper,[1] of the Hooper Foundation for Medical Research at the University of California, have addressed themselves to this problem. As a result, they have ascertained that blood regeneration in dogs after simple anemia of definite grade can be influenced at will by various dietary factors. The curve of blood regeneration on a meat diet is very rapid, a matter of days or a few weeks, while the curve of regeneration on a diet rich in carbohydrates is very slow. In some of the animals on a diet of bread and milk it has required months for complete blood regeneration. Iron in the

per hour, and in percentage in the urine. Most of these variations would wholly escape detection by qualitative methods.

In view of the known facts, Benedict urges the abolition of the term "glycosuria." "This word," he says, "was not created by the mind of man, but by the inefficiency of the copper tests. Glycosuria implies a sudden point at which sugar appears in the urine. Since there is no such point, the term glycosuria is without special significance and is misleading." Consequently the term "glycuresis," representing an increase rather than a new appearance of sugar in the urine, is proposed.

If we are to emphasize the continual existence of a glycosuria in man, what is to be said of the so-called tolerance for sugar? Assuredly there has been little agreement on this phenomenon in the past. The "tolerance" of human individuals for glucose on an empty stomach is commonly placed at about 150 gm. Taylor and Hulton[3] reported practically no limit to the tolerance for orally administered glucose in human subjects. Myers[4] found glycosuria following the ingestion of 75 gm. of glucose in a normal subject. According to the newer observations of Benedict and his co-workers, there is no absolute tolerance for carbohydrate except during the fasting state. Here it may reach an upper limit of 50 gm. of glucose; but feeding with either meat or a carbohydrate diet causes an increase in the sugar elimination.

The fact, Benedict concludes, that foods, even when free from any sugar, cause marked glycuresis must serve to emphasize the narrow margin of absolute sugar tolerance even in the normal individual. A certain portion of the sugar from starch or even from meat taken at each meal is waste sugar. This is not due to simple leakage through the kidney. The glycuresis is independent of urinary volume and follows a definite course, reaching a minimum during the fasting hours. Carbohydrate stands apart from other foodstuffs in that the normal organism fails to utilize it completely, even in physiologic quantities. Therefore, Benedict adds, the unique disease, diabetes, springs from seed ever present in the normal organism. Nevertheless, we may perhaps be justified in warning the reader against undue apprehension at first consideration on this score. With an intake of even 500 gm. or more of carbohydrate per day, the wastage of an equal number of milligrams of sugar, if it actually is such, is not a serious indictment of the efficiency of the organism. Meanwhile we shall await with interest the expansion of these observations to a degree where the statistics on persons of unquestionable health and normality will give a more permanent basis for clinical and therapeutic deductions.

Current Comment

THE CHICAGO SESSION

As our forms close, Wednesday morning, there is every indication that the 1918 session of the American Medical Association will be a success in every way. Even the attendance is proving to be far greater than war conditions would warrant one in expecting. The fact that over 20,000 physicians are in active service and the recent increase in railroad rates naturally have interfered with the attendance. In spite of these things, however, the registration for the first two days was 3,552,[1] which was within 231 of being as large as the registration last year, in New York, for the first two days. The Opening Meeting indicated the spirit that is prevailing at this session—a spirit of patriotism, of loyalty, of self-sacrifice. Never before has there been such a large attendance at an Opening Session. There was added enthusiasm and patriotism on account of the presence of the band of the Fort Riley Medical Officers Training Camp, of the two hundred medical officers of the Army and Navy, from that and other camps, who marched on the stage in double file, and of the distinguished medical officers of the allied nations who occupied the foreground. The stirring addresses of the Opening Meeting will be found elsewhere in this issue. The medical military features of the meeting, many of them provided especially by the Surgeon-General's Office, include a late model motor ambulance with spare parts trailer, which drove overland to the meeting from the U. S. Army Motor Ambulance Supply Depot, Louisville, Ky.; the flight to the meeting by a physician aviator, Major H. M. Strong, Post Surgeon at Rantoul, Ill.; the exhibition of the Fort Riley Sanitary School, including over fifty-five models of all of the various types of sanitary devices in use at Army posts and camps; a continuous military motion picture show, with motion pictures issued under the authority of the Commission on Training Camp Activities and the Surgeon-General's Office; and a military medical headquarters in which advice is being given relative to enlistment in the service of the Army and Navy, and in which numerous recruits for the Medical Reserve Corps were enlisted. These and other features too numerous to mention are making the sixty-ninth annual session a historic medical military patriotic meeting.

NECESSITY FOR CARE IN ADMINISTERING ARSPHENAMIN

It is evident that more than the ordinary number of severe reactions from arsphenamin have occurred lately, or that more are coming to light. There are certainly indications that there is need for especial care in its administration at the present time. There is a tendency in some places to make the treatment with it very intensive, even giving daily doses for several successive days. About 50 per cent. of a dose of arsphenamin is excreted during the first three days after intravenous administration, and the remaining part is excreted with diminishing rapidity over a longer time. The daily intensive use of the drug therefore means that it accumulates rapidly in the system; in view of the fact that some of the most serious accidents develop only after several days, the question may justly be raised whether this intensive use is not exposing the patient to added risk, which should not now be taken. It is true that many serious reactions lately reported occurred immediately, indicating also that it would be wise to begin with a small dose — say 0.3 gram. Boiling arsphenamin is also an occasional practice. This should be discontinued. The brand "arsenobenzol" is of difficult solubility, but this brand can be safely dissolved in hot water. The more soluble brands do not stand heat well and should be dissolved in water at room temperature. In general, practitioners should be more than ordinarily cautious in the use of arsphenamin at the present time. We are working under great pressure in medicine as in other lines. This is not the time to be careless of risks in the intensive use of this drug or indifferent to the possibilities of its being made toxic by boiling or other incautious manipulations.

MORPHIN AND REACTION TIME

The announcement of a new journal, *Psychobiology*,[1] states that it is established for "the publication of research bearing on the interconnection of mental and physiological functions. It will include in its volumes, therefore, not only investigations of what is sometimes called 'psychological physiology,' but also investigations in pharmacology, physiology, anatomy, neurology, and psychiatry in so far as the results of these investigations have explicit bearing on problems of mental life, or mental factors are included in the essential conditions of the investigation." The first number illustrates the relation of psychology to pharmacology in a research on the effect of some opium alkaloids on the psychologic reaction time.[2] The effects of alcohol and alcoholic beverages on psychic functions have been investigated frequently; some attention has likewise been paid to coffee and tea and the caffein that they contain. In connection with such commonly used drugs it is often asked whether they really stimulate in the true sense of the word, or, in refined analysis, are they merely found to depress or inhibit? In the case of morphin alone or in combination with other opium alkaloids, Macht and Isaacs[2] of John Hopkins University have found that the answer depends on the dose used. In man, after small doses of morphin, there is generally a primary stage of stimulation or quickened reaction time; this may or may not be followed by a secondary stage of depression, as indicated by narcosis and prolongation of the reaction time. After large doses of morphin, the primary stimulation stage is very short and may be overlooked, whereas the secondary or stage of depression is predominant. The small doses, which gave a distinct primary stimulation, were from 4 to 6 mg. of morphin. The ordinary therapeutic dose of from 8 to 15 mg. (1/8 to 1/4 grain) is reported to be usually too large to make the quickened reaction in normal persons very noticeable; and therefore it seems to have been overlooked. It is the opinion of Macht and Isaacs that the primary stage of quickening or stimulation probably corresponds to the stage of euphoria or well-being, so well known to the pharmacologist, which occurs after small doses of opiates. It is this sense of well-being, they add, which probably is responsible in a great measure for the greater accuracy in mathematical calculations which they tested, especially in subjects with a nervous temperament, since the narcotic action of the drugs is just sufficient to "take the edge out" of the subject's anxiety.

Medical Mobilization and the War

The Smith Bill Passes the House

The Smith bill for vocational rehabilitation which passed the Senate recently, as described in The Journal for May 11, passed the House of Representatives on Monday, June 10.

Honorary Degree Awarded Surgeon-General Gorgas

The honorary degree of doctor of laws was conferred on Surg.-Gen. William C. Gorgas by the New York University and the Bellevue Hospital Medical College, of which Surgeon-General Gorgas is a graduate, at a special meeting in New York on June 5. In an address to the audience he contrasted the methods of military surgery of fifty years ago with those of today; he also stated that the general practitioner, skilled in all fields of medicine—the one who can do anything necessary for the health of the soldier—is the one most urgently needed by the Army.

Personnel of the Medical Department

For the week ending June 7, 1918, the personnel of the Medical Department of the Army included:

Medical Corps: 868, including 1 major-general, 65 colonels, 110 lieutenant-colonels, 298 majors and 395 lieutenants.

Medical Reserve Corps: 19,358, including 1,380 majors, 5,119 captains and 12,859 lieutenants. On active duty: 17,474, including 1,297 majors, 4,799 captains and 11,378 lieutenants.

Medical Corps, National Guard: 1,297, including 19 lieutenant-colonels, 255 majors, 181 captains and 744 lieutenants.

Medical Corps, National Army: 157, including 8 brigadier-generals, 18 colonels, 123 lieutenant-colonels and 8 majors.

The discharges to date are:

Causes	Number M.R.C.	Number M.C.N.G.
Physical disability	671	52
Inaptitude	265	20
Other branches of service	363	72
Resignations	140	33
Domestic troubles	59	0
Needed by community	50	0
Deaths	81	5
Dismissals	10	3
Duty completed	1	0
No reasons given	14	0
	1,654	185

DISEASE CONDITIONS AMONG TROOPS IN THE UNITED STATES

From Telegraphic Reports Received in the Office of the Surgeon-General for the Week Ending May 31, 1918

1. ANNUAL ADMISSION RATE PER 1,000 (disease only):

		Last Week
All Troops	974.5	1,069.1
Divisional Camps	757.8	764.5
Cantonments	1,098	1,200.9
Departmental and other Troops	979.4	1,109.1

2. NONEFFECTIVE RATE PER 1,000 ON DAY OF REPORT:		
All Troops	36.8	39.8
Divisional Camps	31.7	33.4
Cantonments	43.1	46.4
Departmental and other Troops	32.7	35.8
3. ANNUAL DEATH RATE PER 1,000 (disease only):		
All Troops	4.01	5.7
Divisional Camps	2.5	1.9
Cantonments	6.0	9.0
Departmental and other Troops	2.7	4.1

ORDERS TO OFFICERS OF THE MEDICAL RESERVE CORPS

Alabama

To Camp A. A. Humphreys, Accotink, Va., to examine the troops for cardiovascular diseases, from Fort Oglethorpe, Lieut. HENRY C. HARRIS, Birmingham.

To Camp Sevier, Greenville, S. C., base hospital, Lieut. ELDRIDGE T. BROWN, Cleveland.

To Fort Barrancas, Fla., for duty, Capt. FRANK P. PETTEY, Albany.

To Walter Reed General Hospital, Takoma Park, D. C., for duty, Lieut. ROBERT R. DIXON, Tuscaloosa.

Arizona

To Fort Riley for duty, from Camp Cody, Lieut. ISAAC L. GARRISON, Phoenix.

Arkansas

To Camp Pike, Little Rock, Ark., for duty, Lieut. JOHN H. M. HARDY, Malvern.

To Portland, Ore., Yeon Building, for duty, Lieut. SAMUEL B. DEGNAN, Little Rock.

California

To Fort Oglethorpe for instruction, Lieut. ARTHUR J. HOLETON, San Diego.

To Fort Sam Houston, Texas, base hospital, Capt. HARRY H. KOONS, Los Angeles.

To Portland, Ore., Yeon Building, for duty, Capt. JOHN G. GRAFFIN, Fallbrook; Lieuts. GILES S. PORTER, Los Angeles; FREDERICK K. LORD, San Francisco.

To report by wire to the commanding general, Western Department, for assignment to duty, Capt. CHARLES STEIN, Bellflower; Lieuts. DANIEL D. LUCEY, THOMAS A. McINTYRE, Los Angeles.

Colorado

To New Haven, Conn., for duty Capt. WILLIAM P. HARLOW, Boulder.

To report by wire to the commanding general, Central Department, for assignment to duty, Capt. HARVEY R. HALL, La Junta.

The following order has been revoked: *To Fort Logan, Colo.*, for duty, Capt. CHARLES H. FISCHER, Walden.

Connecticut

To Camp Jackson, Columbia, S. C., for duty, Lieuts. GEORGE J. SCHUELE, Bridgeport; E. H. J. HENNESSEY, Stratford.

To Fort Oglethorpe for instruction, Lieut. ELROY W. SMITH, Brookfield.

To New Haven, Conn., for duty, Lieut. LEONARD C. WHITING, New Haven.

To New York City, Cornell Medical College, for instruction in military roentgenology, from Fort Oglethorpe, Lieut. ARTHUR S. GRANT, Hartford.

To New York City, Neurological Institute, for instruction, Lieut. HENRY G. JARVIS, Hartford.

District of Columbia

To Walter Reed General Hospital, Takoma Park, D. C., for temporary duty, Major JOSEPH H. BRYAN, Washington.

To Washington, D. C., St. Elizabeth's Hospital, for intensive training, Lieut. DILLON G. O'NEILL, Washington.

Georgia

To Douglas, Ariz., for duty, from Camp Dix, Capt. WILLIAM G. HUNTER, Augusta.

To Fort McPherson, Ga., for duty, Lieut. HENRY W. SHAW, Augusta.

Idaho

To Hoboken, N. J., for duty, from Camp Dix, Lieut. ELTON B. ROGERS, Winchester.

To report by wire to the commanding general, Western Department, for assignment to duty, Lieuts. CHARLES J. MARTIN, Dwiggs; FRANCIS S. MILLER, Inkom.

Illinois

To Boston, Mass., Harvard Graduate School of Medicine, for instruction from Army Medical School, Lieut. BEVERIDGE H. MOORE, Chicago.

To Camp Colt, Gettysburg, Pa., for duty, Lieuts. MORRIS B. KARATZ, BENJAMIN M. WELIN, Chicago; FRANK L. TOWNSLEY, East Chicago; SENN F. WHISTLER, Laomi.

To Camp Gordon, Atlanta, Ga., for duty, Lieut. GEORGE E. SANDERS, Chicago.

To Camp Grant, Rockford, Ill., base hospital, from Fort Oglethorpe, Capt. ROBERT S. GREGG, Chicago.

To Camp Pike, Little Rock Ark., for duty, Lieuts. MYRON I. INGRAM, WILLIAM R. READ, Chicago.

To Camp Zachary Taylor, Louisville, Ky., base hospital, Lieuts. JAMES E. ARNOLD, HUGO W. TRAUB, Chicago.

To Camp Zachary Taylor, Louisville, Ky., for duty, from Camp Sherman, Lieut. WALTER G. MOHR, Chicago.

To Fort Oglethorpe for instruction, Lieut. ROY GRIFFY, Oblong.

To Jefferson Barracks, Mo., for duty, Lieut. MAX L. FOLK, Elgin.

To New Haven, Conn., for duty, Lieut. ROBERT M. CARPENTER, St. Charles.

To report to the commanding general, Central Department, for duty, Major JOHN A. ROBISON, Chicago.

The following order has been revoked: *To Camp Bowie*, Fort Worth, Texas, for duty from Fort Riley, Lieut. RUSSELL A. HENNESSEY, Chicago.

Indiana

To Camp Sherman, Chillicothe, Ohio, for duty, Lieut. VENICE D. KEISER, Indianapolis.

To Camp Travis, Fort Sam Houston, Texas, for duty, from Fort Clark, Texas, Lieut. EDGAR R. HIATT, Portland.

To New York City, Cornell Medical College, for instruction in military roentgenology, from Fort Oglethorpe, Lieut. CHESTER A. MARSH, Newcastle.

Iowa

To Camp Forrest, Chickamauga Park, Ga., for duty, from Camp Sherman, Capt. HERBERT W. PLUMMER, Lime Springs.

To Camp Hancock, Augusta, Ga., base hospital, Capt. CHARLES B. McGLUMPHY, Iowa City.

To Camp Pike, Little Rock, Ark., for duty, Capt. JAMES A. HULL, Ottumwa; Lieut. BENJAMIN L. MEIGS, Fort Dodge.

To Portland, Ore., Yeon Building, for duty, Lieut. MARTIN L. HOOPER, Indianola; FRANK W. MILLS, Ottumwa; FREDERICK H. GRABER, Stockport; EVERETT E. RICHARDSON, Webster.

Hawaii

To Hawaiian Department for duty, Capts. CHARLES ADAMS, Honolulu; FLETCHER G. SANBORN, Molokai; Lieut. FRANK R. MISSNER, Maui.

Kansas

To Camp Pike, Little Rock, Ark., for duty, Lieuts. SEBREE S. McGINNIS, Dighton; JAMES B. DONNELL, Kingsley.

Kentucky

To Camp A. A. Humphreys, Accotink, Va., to examine the troops for cardiovascular diseases, from Camp Meade, Capt. THOMAS F. MILLER, Glasgow.

To Camp Colt, Gettysburg, Pa., for duty, Lieuts. HARTMAN A. LICHTWARDT, Berea; GEORGE L. THOMPSON, Lovelasville.

To report to the commanding general, Southern Department, for assignment to duty, from Fort Sam Houston, Capt. JETHRA HANCOCK, Louisville.

Louisiana

To Camp Jackson, Columbia, S. C., Base hospital, Lieuts. PANAGIOTIS M. PAPOULACOS, Boston; FREDERICK A. MEAD, Willimansett.

To Camp Jackson, Columbia, S. C., for duty, Lieuts. JOSEPH C. MENENDEZ; JONAS W. ROSENTHAL, New Orleans.

To Camp Sevier, Greenville, S. C., base hospital, Lieut. ALBERT A. SHAPIRA, Boston.

To Fort Bliss, Texas, base hospital, Major HAMILTON P. JONES, New Orleans.

To Fort McPherson, Ga., for temporary duty, Capt. CARLOS G. SALLOS, Thibodaux.

To Fort Riley for duty, from Camp Beauregard, Major JAMES B. GUTHIE, New Orleans; from Camp Cody, Lieut. JAMES E. DYSON, Manilla.

To Hoboken, N. J., for duty, Lieut. GEORGE H. SCHWARTZ, East Boston.

To New Haven, Conn., for duty, Lieut. BEN R. HENINGER, New Orleans.

Maryland

To Camp Jackson, Columbia, S. C., *Camp Hancock*, Augusta, *Camp Wheeler*, Macon, *Camp Gordon*, Atlanta, and *Camp Forrest*, Chickamauga Park, Ga., *Camp McClellan*, Anniston, and *Camp Sheridan*, Montgomery, Ala., *Camp Shelby*, Hattiesburg, Miss., and *Camp Jackson*, Columbia, S. C., for orthopedic instruction, Capt. HENRY P. MAUCK, Baltimore.

To Hoboken, N. J., base hospital, from Camp Meade, Lieut. AUSTIN H. WOOD, Baltimore.

Massachusetts

To Camp Hancock, Augusta, Ga., with the board examining the troops for cardiovascular diseases, from Fort Oglethorpe, Lieut. HARRY A. WALKER, Somerville.

To Hoboken, N. J., for duty, from Camp Meade, Lieut. EVERETT A. MERRILL, Lynn.

To New York City, Cornell Medical College, for instruction in military roentgenology, from Fort Oglethorpe, Lieut. WHITMAN K. COFFIN, West Medford.

Michigan

To Camp Custer, Battle Creek, Mich., base hospital, Lieut. GEORGE W. WILSON, Detroit.

To Camp Jackson, Columbia, S. C., for duty, Lieuts. JOHN H. ROCK, Detroit; BUELL H. VAN LEUVEN, Petoskey.

To Camp Sherman, Chillicothe, Ohio, for duty, Lieut. CHARLES R. DENGLER, Jackson.

To report by wire to the commanding general, Central Department, for assignment to duty, Lieut. ARCHIBALD McKILLOP, Wolverine.

The following order has been revoked: *To Camp Logan*, Houston, Texas, for duty, from Fort Riley, Lieut. OTIS B. MALLOW, Detroit.

Minnesota

To Camp Colt, Gettysburg, Pa., for duty, Lieut. RICHARD N. JONES, Minneapolis.

To Camp Meade, Annapolis Junction, Md., base hospital, from Camp Colt, Capt. JOHN W. LEE, Minneapolis.

To Fort Oglethorpe for instruction, Lieut. HARRY OERTING, Minneapolis.

To Jefferson Barracks, Mo., for duty, from Fort Riley Lieut. LINWOOD M. KEENE, Alexander.

To New Haven, Conn., for duty, Capt. GEORGE W. BEACH, Walker.

To Portland, Ore., Yeon Building, for duty, Lieut. JOSEPH W. LECLERC, LeSueur.

To Rockefeller Institute for instruction in the treatment of infected wounds, and on completion *to Camp Upton*, L. I., N. Y., base hospital, Lieut. LESLIE H. REDELINGS, Rochester.

Mississippi

To Camp Jackson, Columbia, S. C., for duty, Lieut. TUCKER T. FLEMING, Minter City.

To Rockefeller Institute for instruction in the treatment of infected wounds, and on completion *to his proper station*, from New York City, Major JOHN W. BARKSDALE, Winona.

Missouri

To Camp Bowie, Fort Worth, Texas, as assistant to camp surgeon, from Camp Hancock, Lieut. ROY F. MILLS, Odessa.

To Camp Dodge, Des Moines, Ia., base hospital, Lieut. GEORGE H. MORELAND, Butler.

To Camp Jackson, Columbia, S. C., for duty, Capt. URIEL P. HAW, Benton.

To Fort Riley, base hospital, Lieut. GEORGE W. SMITH, Kansas City.

To Hoboken, N. J., for duty, from Camp Sheridan, Capt. ERNEST G. MARK, Kansas City.

To Rockefeller Institute for instruction in laboratory work, and on completion *to Army Medical School* for duty, Capt. PHELPS G. HICKFORD, St. Louis.

To Washington, D. C., for duty in the Surgeon-General's Office, from Jefferson Barracks, Major HENRY G. WYER, Kirkwood.

Montana

To Fort Snelling, Minn., for duty, from Camp Grant, Lieut. HERBERT HAYWARD, Darby.
To Hoboken, N. J., for duty, Lieut. Thomas B. Scott, Butte.

To Camp Jackson, Columbia, S. C., for duty, Lieut. WILLIAM G. FLICKINGER, [illegible]
[illegible] *hnston*, Jacksonville, Fla., for duty, Capt. [illegible], Kings Park, L. I.; Lieuts. CHARLES L. WOITZ, Mt. Vernon; ARTHUR H. McFARLAND, New York City.
To Camp Sevier, Greenville, S. C., base hospital, Lieut. DAVID TROPAUER, New York City.
To Fort Oglethorpe for instruction, Lieuts. ABRAHAM RAVICH; HENRY H. BEINFIELD, HENRY L. PILZER, Brooklyn; DOUGLAS F. ROBBINS, Poughkeepsie.
To Fort Oglethorpe for temporary duty, from Fort Riley, Lieut. JOHN F. CURTIN, New York City.
To Hoboken, N. J., base hospital, Lieut. MILTON J. WILSON, Mount Vernon. For duty, Lieuts. GEORGE P. DE TUNCQ, Blackwells Island; JOHN H. ROBERTSON, New York City.
To Hoboken, N. J., for duty, from Camp Dix, Lieut. ADOLPH A. WEISS, New York City.
To New Haven, Conn., for duty, Lieut. MORRIS A. SAGOWITZ, New York City.
To Plattsburg Barracks, N. Y., for inspection and on completion *to his proper station*, Major RICHARD H. HUTCHINGS, Ogdensburg.
To Rockefeller Institute for instruction in laboratory work, and on completion *to Army Medical School*, for duty, Lieut. ROBERT P. DOBBIE, Buffalo. For instruction *in the* treatment of infected wounds, and on completion *to Camp Devens*, Ayer, Mass., base hospital, Lieut. WILBUR C. TRAVIS, Northport.
To Walter Reed General Hospital, Takoma Park, D. C., for temporary duty, Lieut. CLARENCE F. FOWLER, New York City.
To Williamsbridge, N. Y., for temporary duty, from New York City, Lieut. FREDERICK C. KELLER, New York City.
The following order has been revoked: *To Camp Jackson*, Columbia, S. C., for duty, Lieut. PAUL T. HARPER, Albany.

North Carolina

To Fort Oglethorpe for instruction, Lieut. AUSTIN P. KLUTZ, Maiden.
To New York City, Neurological Institute, for instruction, from Camp Gordon, Lieut. LOUIS N. WEST, Raleigh.

Ohio

To Fort Oglethorpe for instruction, from Camp Kelly, Capt. JOHN C. MILLER, Payne.

Oklahoma

To Camp Dodge, Des Moines, Ia., base hospital, Lieut. WILLIAM B. NEWLON, Tulsa.
To Camp MacArthur, Waco, Texas, for duty, Capt. GREGORY A. WALL, Tulsa.
To San Francisco, Calif., Letterman General Hospital, for temporary duty, Major ROBERT L. MULL, Oklahoma City.

Oregon

To report by wire to the commanding general, Western Department, for assignment to duty, Capt. ERNEST N. CROCKETT, Portland; Lieut. WILLIAM P. CHISHOLM, Gold Hill.

Pennsylvania

To Army Medical School for duty, from Rockefeller Institute, Capt. WILLIAM H. BAILEY, Philadelphia.
To Camp Colt, Gettysburg, Pa., for duty, Lieut. RALPH R. WHITAKER, Williamsburg.
To Camp Jackson, Columbia, S. C., for duty, Lieut. STANLEY H. HOLLAND, Industry.
To Camp Joseph E. Johnston, Jacksonville, Fla., for duty, Lieut. FREDERICK W. KNOLL, Reading.
To Fort Riley for instruction, Lieut. CLARENCE J. McCULLOUGH, Washington.
To Lakewood, N. J., for duty, from Camp Cody, Major WILLIAM H. THOMAS, Philadelphia.
To Mineola, L. I., N. Y., for temporary duty, and on completion *to his proper station*, Major ISAAC H. JONES, Philadelphia.
To Mineola, L. I., N. Y., Signal Corps Aviation School, for duty, Lieut. WILLIAM B. SWARTLEY, Philadelphia.
To New Haven, Conn., for duty, Capt. WILLIAM G. TURNBULL, Cresson; Lieut. JAMES W. WOOD, Chester.
To New York City, for duty, from Camp Zachary Taylor, Lieut. ARCHIE W. DUNN, Philadelphia. Cornell Medical College for instruction in military roentgenology, from Camp Meade, Lieut. CHARLES A. FITZGERALD, Clarion.
To Portland, Ore., Yeon Building, for duty, Lieut. JONATHAN M. MANSFIELD, Clinton.
To Rockefeller Institute for instruction in laboratory work, and on completion *to Army Medical School* for duty, Lieut. WILLIAM H. JONES, Shaft.
To Rockefeller Institute for instruction in the treatment of infected wounds, and on completion to Camp Devens, Ayer, Mass., base hospital, from Camp Forrest, Capt. FREDERICK B. ALLEN, North Wales; for instruction in the treatment of infected wounds, from New York City, Lieut. DAVID B. HAWKINS, Philadelphia.
To report by wire to the commanding general, Eastern Department, for assignment to duty, Capt. WILLIAM S. STEWART, Sagamore.
The following order has been revoked: *To Camp Crane*, Allentown, Pa., base hospital, Lieut. JOHN R. DAVIES, Jr., Philadelphia.

Philippine Islands

To Hoboken, N. J., for duty, from Baltimore, Capt. HENRY W. KENNARD, Manila.
To Philippine Department for duty, Capt. JAMES L. BOOTH, Lieut. JUAN L. PAYSWALL, Manila.

Porto Rico

To Camp Las Casas, San Juan, P. R., for duty, Lieut. RAMON L. RODRIGUEZ, Bayamon.

South Carolina

To report by wire to the commanding general, Southeastern Department, for assignment to duty, Lieut. CHARLES A. McLURKIN, Chester.

Tennessee

To Camp Jackson, Columbia, S. C., for duty, Lieut. MARTIN L. BLACK, Windrock.
To Camp Pike, Little Rock, Ark., for duty, Lieut. RHEA F. GARRETT, Dixon Springs.
To Clemson, S. C., Agricultural College, to make physical examinations and give medical attention to the drafted *men enrolled* at this institution, from Fort Oglethorpe, Lieut. JAMES M. SMYTH, Camden.
To Fort Barrancas, Fla., for duty, Capt. JAMES H. McCALL, Huntingdon.
To Fort Oglethorpe for duty, from Camp Greene, Capt. BERNARD C. McMAHON, Memphis.

Texas

To Camp MacArthur, Waco, Texas, for duty, Lieuts. WILLIAM P. MEREDITH, JAMES McC. MITCHNOR, Houston; BLUFORD A. SWINNEY, Newton.
To Camp Pike, Little Rock, Ark., for duty, Lieuts. ROBERT A. ROBERTS, San Antonio; JOHN R. DESTEIGUER, San Marcos.
To Camp Travis, Fort Sam Houston, Texas, for duty, Lieut. MARION L. COMPTON, Galveston.
To Camp Wadsworth, Spartanburg, S. C., for duty, from Fort Apache, Capt. ROBERT H. McLEOD, Palestina.
To Fort Logan, Colo., for duty, Lieut. DEWITT G. BURKES, San Antonio.
To report by wire to the commanding general, Southern Department for assignment to duty, from Fort Worth, Lieut. TRUMAN C. TERRELL, Fort Worth.

Utah

To Fort Douglas, Utah, base hospital, from Camp Grant, Lieut. CLARENCE A. NYVALL, Salt Lake City.
To report by wire to the commanding general, Western Department, for assignment to duty, Lieut. CLAUDE E. WARDLEIGH, Ogden.

Vermont

To Camp Jackson, Columbia, S. C., for duty, Lieut. CLIFTON H. SMITH, West Rupert.

Virginia

To Camp Joseph E. Johnston, Jacksonville, Fla., for duty, Lieut. JOSEPH H. HOLLOWAY, Fort Royal.
To Newport News, Va., for duty, from Army Medical School, Lieut. ALBERT P. TRAYNHAM, Richmond.

Washington

To Fort Riley for instruction, Capt. WILLARD G. PALMER, Seattle.
To Portland, Ore., Yeon Building, for duty, Capt. HERMAN S. JUDD, Tacoma; Lieut. CHARLES A. HAUBER, Chewelah.
To San Francisco, Calif., for instruction, and on completion *to Camp Kearny*, Linda Vista, Calif., base hospital, Lieut. BURTON E. FLEMING, McCleary.
To report by wire to the commanding general, Western Department, for assignment to duty, Lieut. MARTIN J. LACEY, Auburn.

West Virginia

To Camp Lee, Petersburg, Va., for duty, Lieut. JOHN C. LAWSON, Logan.
To Fort Oglethorpe for instruction, Lieut. LESLIE E. SAUGHERTY, Davis.

Wisconsin

To Camp Colt, Gettysburg, Pa., for duty, Capt. STEPHEN E. GAVIN, Fond du Lac.
To Camp Grant, Rockford, Ill., base hospital, from Fort Riley, Capt. ALBERT A. AXLEY, Butternut.
To Portland, Ore., Yeon Building, for duty, Capt. ALBERT A. PARKER, Clinton; Lieuts. JOHN C. SCOTT, Marinetta; WORTHINGTON L. RANTZ, Rosholt.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest; such as relate to society activities, new hospitals, education, public health, etc.)

GEORGIA

State Association Meeting.—The sixty-ninth annual meeting of the Medical Association of Georgia was held in Savannah, April 17 to 19, and the following officers were elected: president, Dr. Jarrett W. Palmer, Ailey; vice presidents, Drs. George R. White, Savannah, and Lee B. Clarke, Atlanta, and delegates to the American Medical Association, Drs. Henry H. Martin, Savannah, and Stewart R. Roberts, Atlanta. Atlanta was selected as the next place of meeting.

The Venereal Campaign.—At a recent conference in Atlanta between Prof. C. Wardell Stiles, U. S. P. H. S., and a representative of the state board of health, it was planned to establish a venereal clinic in each of the twelve congressional districts of the state. The regulations provide for a report of every case of venereal disease to be made by number; for the dissemination of information regarding venereal disease; for the examination and investigation of all cases; for the protection of others from infection; for the quarantine of affected persons, and for the prohibition of treatment by druggists. The regulations further declare that the spread of the disease is unlawful and that prostitution will be repressed, and that no physicians shall give a certificate of freedom from venereal disease, and that all records must be kept secret.

Personal.—Dr. R. Holmes Mason has been elected president and Dr. F. F. Jones, secretary, of the Rotary Club of Macon.——Dr. Thomas R. Wright, Augusta, has been reappointed a member of the board of trustees of the Georgia State Sanatorium, Milledgeville.——Dr. D. K. Dowd has been appointed city physician of Atlanta, succeeding Dr. James G. Hall, who is in the military service.——Dr. Charles H. Richardson, Jr., Macon, has been appointed a member of the state board of health, succeeding Dr. Howard J. Williams, deceased.——Dr. James E. Paullin, professor of practice of medicine in Emory University, Atlanta, has been appointed chief of medicine in the Emory Base Hospital, succeeding Major Stewart R. Roberts, who has been appointed commander of the base hospital at Camp Jackson, Greenville, S. C.

IDAHO

Reciprocal Relations Extended.—A letter from Dr. Ray H. Fisher, secretary of the Idaho State Board of Medical Examiners, states that at a meeting held in April, 1918, it was voted to extend the registration of physicians by reciprocity to those who have been licensed by examination in Arizona, California, Colorado, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming. Applicants will be eligible for registration, provided the intellectual requirements of these states meet the Idaho board's approval, and provided the applicant's moral and ethical record is above reproach. The reciprocal license fee is $50.

ILLINOIS

Higher Requirements in Illinois.—A letter from the department of registration and education states that after Oct. 15, 1918, no medical college will be recognized as in good standing in Illinois unless it requires for admission two years of work in an approved college of liberal arts or a fully equivalent education.

Diphtheria at Camp.—June 9, four cases of diphtheria were found among the troops of the third company of the first provisional regiment at the college students' training camp at Fort Sheridan. The company barracks were placed under quarantine. Most of the men of this company are from Purdue University and the University of Chicago.

Northwestern Alumni Elect Officers.—At the annual meeting of the Northwestern Medical School Alumni Association held in Chicago, June 10, Major Samuel C. Stanton ('92), M. R. C., U. S. Army, Chicago, was elected president; Dr. Luther J. Osgood ('03), Chicago, secretary-treasurer, and Dr. Horace M. Starkey ('78), Rockford, necrologist. At the smoker that followed the meeting, Col. William N. Bispham, M. C., U. S. Army; Majors Franklin H. Martin and Edmond J. Doering, Lieut.-Com. David S. Hillis, President Thomas F. Holgate of Northwestern University, and Dr. Luther J. Osgood, newly elected secretary of the faculty, were the speakers.

Course for Community Nurses.—According to the Illinois *Health News*, plans have been practically completed to establish in Springfield a two months' emergency graduate course for community nurse. This will be conducted by the state department of health, the state department of public welfare, and the Illinois Tuberculosis Association, with the cooperation of the Chicago School of Civics and Philanthropy, the Elizabeth McCormick-Fund, the Chicago Tuberculosis Institute, and other state and city welfare organizations. No fees will be charged. Graduate nurses registered in Illinois, or in their own states, will be eligible to the course. Graduates must agree to engage immediately in public service nursing in Illinois.

Chicago

Venereal Disease Hospital Opened.—The old contagious disease hospital, at West Thirty-Fourth Street and Lawndale Avenue, was opened by the city health department, June 3, for the treatment of women suffering from venereal disease, under the new regulations for the eradication of venereal disease.

Investigation of Irregulars.—The state department of medical registration has taken up the investigation of irregular practitioners in Chicago, and already about fifteen have been required to appear before the board of registration to confirm the correctness of their methods, and their right to practice medicine in the state.

KENTUCKY

Hospital Unit Called.—After a long period of training Dr. Barrow, Base Hospital Unit No. 40, was called, May 25, for active duty in France. The unit was recruited from the central Kentucky towns.

Officers Elected.—The Southwestern Kentucky Medical Association at its meeting at Paducah, May 14, elected the following officers: president, Dr. Benjamin B. Keys, Murray; vice presidents, Drs. Finis M. Travis, Benton, and Stanley Mullins, Wingo; secretary, Dr. Edwin A. Stevens, Mayfield (reelected); treasurer, Dr. Henry G. Reynolds, Paducah. The association will meet again in October at Murray.

Personal.—Dr. Jesse I. Whittenberg, health officer of Jefferson County, has resigned and Dr. Clarence H. Harris has been appointed to succeed him.——Dr. Argus D. Willmoth, Louisville, and Dr. Elijah H. Maggard, Wayland, have been appointed members of the state tuberculosis commission by the governor.——Dr. Arthur M. Barnett, president of the Jefferson County Board of Health, has been appointed jail physician to succeed Dr. Llewellyn P. Spears.——Dr. Vernon Robins, previously bacteriologist of the health department but recently state director of sanitation in Alabama, has been reappointed to the position of city bacteriologist under Health Officer Thomas H. Baker.——Dr. J. E. Stuckey has been urged to accept an appointment as head of a hospital in Panama, Canal Zone.——Dr. William S. Petrie, Fairview, who was recently operated on for a gastric ulcer, is now improving.

MARYLAND

One Hundred and Forty-Three Nurses Qualify.—One hundred and forty-three nurses, representing twenty-one training schools in Maryland, passed the examinations for state registration, held under the direction of the Maryland State Board of Examiners of Nurses at the Medical and Chirurgical Faculty building, Baltimore, May 9 and 10. While the majority of these nurses are still in training, they were admitted to the examinations at an earlier date than usual because of the demand for Red Cross nurses. Since obtaining certificates from the state board, they are eligible for Red Cross work immediately on completion of the courses at their respective training institutions.

Personal.—Sir James Mackenzie of Edinburgh, Scotland, and physician to the London Hospital, and an authority on diseases of the heart; Sir William Arbuthnot Lane, an authority on treatment of fracture and cleft palate, and consulting surgeon of Guy's Hospital, London, and Col. Herbert A. Bruce, Toronto, consulting surgeon to the British armies in France, were in Baltimore during the past week to visit the Johns Hopkins Hospital and other medical institutions.——Dr. William M. Dabney, captain in the American Red Cross organization, has returned to Baltimore from France, where he has been in charge of a large experimental hospital of the Red Cross.——Capt. Alexander D. McConachie, Baltimore, who is attached to the Medical Reserve Corps, U. S. Army, has arrived in France.——Dr. J. Percy Wade, superintendent of the Spring Grove State Hospital, Catonsville; Dr. Charles G. Hill., Mount Hope Retreat, and Dr. Edward N. Brush, superintendent of the Sheppard and Enoch Pratt Hospital, Towson, attended the annual meeting of the American Medico-Psychological Association in Chicago, last week.——Dr. Arthur P. Herring, secretary of the State Lunacy Commission of Maryland, was elected secretary of the American Medico-Psychological Association at its recent meeting in Chicago.——Mrs. Agnes C. Hartridge, a Johns Hopkins graduate of 1900 and former superintendent of nurses at the University Hospital, Augusta, Ga., has been placed in charge of the admitting office at the Johns Hopkins Hospital. Mrs. Hartridge takes the place of Dr. William C. Leavenworth, who has taken charge of the dispensary at the Hopkins. The latter succeeds Dr. L. Palmer Holmes, who has entered the Medical Reserve Corps, U. S. Army.——Dr. Cornelius DeWeese, one of the directors of the Laurel Sanitarium, at Laurel, was acquitted by the Circuit Court of Montgomery County of criminal blame in connection with the death of Ambler McManus, who died as a result of injuries sustained when struck by an automobile driven by Dr. DeWeese.

MASSACHUSETTS

Officers Elected.—At the thirty-fifth annual meeting of the American Climatological and Clinical Association, held at Boston, June 6, the following officers were elected: president, Dr. Guy Hinsdale, Hot Springs, Va.; vice presidents, Drs. Joseph H. Pratt, Boston, and Hugh M. Kinghorn, Saranac Lake, N. Y.; secretary-treasurer, Dr. Arthur K. Stone, Boston, and recording secretary, Dr. William D. Robinson, Philadelphia.

Harvard Medical Alumni Association.—The annual meeting of the Harvard Medical Alumni Association will be held this year at the time of the meeting of the Massachusetts Medical Society, Wednesday, June 19, at 2 p. m., in the Boston Medical Library. Reports will be received and officers elected. Graduates of the Harvard Medical School are invited to be present at this meeting and also at the alumni spread at Cambridge on Commencement Day, June 20, at 12 o'clock.

NEW YORK

New York City

Surgeon-General Gorgas Addresses Medical Faculty.—On the afternoon of June 5, Surgeon-General Gorgas delivered an address before the faculty of New York University and Bellevue Hospital Medical College on "The Activities of the Medical Department of the United States Army," at the Carnegie Laboratory of the medical college.

Personal.—Dr. Charles Gilmore Kerley resigned as professor of pediatrics at the New York Polyclinic Medical School and Hospital, and his resignation took effect June 1, 1918.——Drs. George E. Vincent and Livingston Farrand have returned from France, where they have been engaged in antituberculosis work for the Rockefeller Foundation.

Program of War Camp Community Service.—The Rockefeller Foundation has contributed $25,000 as an initial step to make possible a demonstration of a plan of adequate care and entertainment of negro troops in a typical war camp community. In explaining the reasons for the appropriation, the announcement says that while plans have been evolved in all the communities, no carefully developed program has been worked out. The medical departments of the Army and Navy, the state and the federal health service, the Red Cross, the training camps commission, the Y. M. C. A., and similar organizations are to cooperate with the American Social Hygiene Society in the demonstration. More than $135,000 is available for the work.

Women Demand Control of Medical College.—An appeal has been made to the New York Board of Regents by a committee of women physicians and surgeons, who are members of the medical board of the New York Medical College and Hospital for Women, asking that the charter of that institution be revoked and a new charter issued forthwith which will place the institution permanently under the control of women workers. It is claimed that certain men physicians on the board of trustees have violated the provision of the charter, that the institution's functions shall be largely educational, in that they have adopted a resolution abolishing the college and clinic of the institution and dismissing the teaching faculty. It is also contended that the meeting at which these resolutions were adopted was irregular and was held without due notice. The men who passed the resolutions abolishing the college contend that the college and dispensary were being conducted at a loss. The board of regents has promised an early ruling.

Threatened Dissolution of Alliance Between Hospital and University.—The alliance between Columbia University and the Presbyterian Hospital, which was made in 1911, and was to have resulted in the establishment of a great medical center which should combine Columbia College of Physicians and Surgeons and the Presbyterian Hospital into a new institution to be erected on Gun Hill Road in the Bronx, is about to come to an end. The board of managers of the hospital have asked the trustees of the university to join with them in cancelling the agreement. This request came before the board of trustees of Columbia University and was referred to the committees on education and finance of the board of trustees. President Butler has issued a statement declaring that the cooperation which has existed between the hospital and the university has worked admirably and to the advantage of both institutions. The difficulties which have arisen relate solely to the plans for future development. The hospital has been fortunate in raising funds which would defray its part of carrying out the plans for consolidation, whereas all the efforts made by the university to obtain funds to meet its share of the obligation have been futile. It has also been found that the total cost of the amalgamation would far exceed the original estimates of $15,000,000.

PENNSYLVANIA

Philadelphia

Fly Campaign.—Dr. Wilmer Krusen, director of public health and charities, in his weekly bulletin urges methods for combating the fly—the enemy at home. He especially urges that fly traps and fly paper be put in the homes, that foodstuffs be kept under cover, that sinks be kept clean and that all garbage be kept in a tightly covered receptacle.

University Chair Endowed.—A $50,000 bequest to the University of Pennsylvania is included in the will of the late Dr. William C. Goodell. In the event of the estate not equaling the total of the university bequest a trust fund is to be created and a bequest paid from the income in instalments. The money is to be used to endow a chair of gynecology.

Personal.—Dr. Judson Daland has been placed on active duty as consulting physician to the Fourth Naval District, which includes Philadelphia, with the rank of lieutenant-commander.——Raymond M. Trice, Philadelphia, attached to the central medical department, American expeditionary forces, has been awarded the Croix de Guerre for services near Paris during one of the recent air raids.

TENNESSEE

District Association Meetings.—The West Tennessee Medical and Surgical Association held its annual meeting, May 24, and elected the following officers: president, Dr. John Yarbrough, Covington; vice presidents, Drs. John D. Brewer, Newbern, and Hermon Hawkins, Jackson; secretary-treasurer, Dr. R. A. McSwain, Paris, and assistant secretary, Dr. George R. McSwain, Paris. Dyersburg was selected as the next place of meeting.——The forty-eighth semiannual meeting of the Middle Tennessee Medical Association was held in Shelbyville, May 16 and 17. Columbia was designated as the next place of meeting. Dr. Jesse F. Adams, Bradyville, was elected president; Dr. John Witherspoon, Nashville, vice president, and Dr. Milton Tharp, Nashville, secretary-treasurer.

Personal.—Dr. W. H. Brice, Mount Pleasant, is seriously ill at his home, as the result of taking poison by mistake instead of quinin.——Dr. J. B. Bond, superintendent of the Western Hospital, Bolivar, has resigned and will resume practice at Union City.——Drs. Reese Q. Lillard, Lebanon, secretary and executive officer, and Harrison H. Shoulders, assistant secretary and registrar of vital statistics, of the Tennessee State Board of Health, have resigned.——Dr. Olin West, Nashville, has been elected secretary of the state board of health, succeeding Dr. Lillard.——Elmo W. Mitchell, superintendent of the Eastern Hospital for the Insane, Nashville, has resigned and will resume practice at Crossville.——Dr. Christopher C. Carpenter, Fayetteville, has succeeded Dr. Charles L. Goodrich as local railway surgeon.

CANADA

Personal.—Lieut.-Col. John Nisbet Gunn, Calgary, Ont., commanding officer of the 8th Field Ambulance in France, who is home in Toronto on sick leave, has received word by cable that he has been awarded the Distinguished Service Order.——Lieut.-Col. Archibald L. C. Gilday, Montreal, who went overseas as medical officer to a Montreal battalion and was promoted to the rank of commanding officer of a field ambulance, returned to Montreal, June 5, on sick leave. He was wounded just six weeks ago, and it is considered quick work to have a wounded officer returned to Canada in so short a time.——Among those decorated for service, in the King's birthday honor list, is Major Theodore A. Lomer, C. A. M. C., who received the D. S. O. Major Lomer was medical officer of health for Ottawa when he enlisted with the first contingent. He has served in France more than three years. Major Lomer was for a time on the staff of the Montreal General Hospital. He was superintendent of the Alexandra Hospital, Montreal, when he resigned to become medical officer of health for Ottawa.——Capt. Gerald Allison, R. A. M. C., Picton, Ont., has returned to the front after a few weeks' furlough in Canada. Captain Allison has served in Egypt, Gallipoli, India and France.——Lieut.-Col. Harold R. Ker, C. A. M. C., has been ordered to report at Halifax, N. S., under appointment as assistant director of medical services in charge of wounded soldiers from overseas.——Capt. Henry Crassweller, formerly of Windsor, Ont., who has been in active service more than three years, is reported missing. He was with the R. A. M. C. in Egypt, and later on the Saloniki front.

GENERAL

Railway Surgeons Hold Meeting.—At the annual meeting of the Central Georgia Railway Surgeons' Association held in Montgomery, May 16, the following officers were elected: president, Dr. Walter E. Saunders, Arlington, Ga.; vice presidents, Drs. Charles A. Thigpen, Montgomery, Ala., and George L. Alexander, Forsyth, Ga.; secretary-treasurer, Dr. Craig Barrow, Savannah, Ga.

New Section on Medicines.—A commodity section on medicines and medical supplies has been incorporated by the War Industries Board. Lieut.-Col. F. F. Simpson will be chief. The new section will deal with surgical supplies, instruments, dressings, serums, and other hospital and medical supplies, and will cooperate with the work of the chemical division in dealing with fine chemicals, photographic chemicals, etc.

Personal.—Dr. J. Christ-O'Day, formerly of Mankato, Minn., and Oil City, Pa., delivered an address at a town mass meeting held, April 21, in Honolulu, urging the establishment of a permanent internment camp in the territory of Hawaii.——Senior Surg. Charles E. Banks, U. S. P. H. S., in charge of the Camp Funston Civil Sanitary District, with headquarters at Manhattan, Kan., has been appointed medical director of the War Risk Insurance Bureau, with headquarters in Washington, D. C.

Antityphoid Inoculations Free.—The Treasury Department authorizes the statement that in order to protect the health of workers and others at a time when the labor of every man possible is needed, the U. S. Public Health Service has been directed to give antityphoid inoculations without charge to all who apply to any of its hospitals or field offices. This will include the territory in the extracantonment zones, U. S. Marine hospitals, etc. Other preventive measures, such as the disposal of excreta, are being vigorously applied.

Army School of Nursing.—The Secretary of War has authorized the Surgeon-General of the Army to establish an army school of nursing with branch training schools in various selected military hospitals throughout the United States. The necessities of the war required the establishment of this training to supplement the present supply of trained graduate nurses. The opening of this course of nursing will give opportunity for patriotic young women to become army nurses. The courses in nursing will conform, as far as possible, to the courses in the civil hospitals, and diplomas will be granted, providing these hospitals remain open long enough to complete the course in accordance with present civil hospital standards.

Optical Industry Organized for War Service.—In compliance with the request of the government for the mobilization of industry for aiding in the prosecution of the war, a meeting of optical manufacturers in New York, May 15, resolved to appoint a war service committee to represent the entire optical industry. A subcommittee of this committee, appointed to report on organization, submitted to the main committee a series of resolutions for adoption pledging the support of the optical manufacturers in securing accurate information with respect to the facilities of the industry; in acting with the priority committee of the war industries board in establishing rules for the distribution of materials, manufacture and transportation; in cooperating with the departments of the government with advice relating to matters affecting the optical industry, and in presenting to the government for consideration all questions relating to the optical industry in which the government is interested.

Bequests and Donations.—The following bequests and donations have recently been announced:

People's Hospital, New York City, $50,000, the proceeds of a benefit theatrical performance.

Long Island College Hospital, Brooklyn, as residuary legatee, $265,044 as its share of the estate of Charles W. West.

Birchard Library, Fremont, Ohio, $2,000, to be used for the purchase of medical books; and for the Sandusky County Medical Society, his medical library, by the will of Dr. Martin Stamm.

Madison, Wis., General Hospital Association, the Clark apartment building, Madison, Wis., valued at about $70,000, by the will of Miss Lucinda W. Rice.

Children's Memorial Hospital, Chicago, $10,000 by the will of Mrs. Potter Palmer.

Harvard Medical School, a donation of $7,500, the income to be used annually to present a gold medal and $500 in cash to the person who may discover in any branch of science means that will result in the greatest good to humanity in connection with the prevention of disease, and the conservation of health, by M. Douglas Flattery.

Michael Reese Hospital, Chicago, $20,000 by the will of Joseph Schaffner.

Fort Wayne, Ind., Lutheran Hospital Association a donation of the property of Dr. Herman Duemling, valued at $8,000 by Dr. Herman A. Duemling.

The clinical building of the Medical College of Georgia, Augusta, $125,000, and for the establishment of a camp for the treatment of tuberculosis, $75,000, by the will of J. B. White, Augusta.

Mailing of Liquids and Oils in Glass.—In Order No. 1490 the Postmaster-General gives revised rules for shipment of admissible liquids and oils not exceeding the limit in weight of fourth class mailing matter, giving the manner in which they shall be packed, etc. Admissible liquids and oils, salves, pastes and other articles easily liquefiable shall be accepted for mailing regardless of the distance, when they conform to the conditions prescribed. The following directions are of interest to physicians: When in strong glass bottles holding 4 ounces or less, the total quantity of liquid shall not exceed 24 ounces. Each bottle shall be wrapped in paper or other absorbent and placed in a box of cardboard or other suitable material and packed in a container made of double-faced corrugated pasteboard of good quality, with tight corners and sealed with tape to prevent escape of liquid, the whole parcel to be securely wrapped with strong paper and secured with twine. Liquids in strong glass bottles holding more than 4 and not more than 16 ounces must be inclosed in a block or tube of metal, wood or papier-mâché, and there must be between the bottle and the block or tube a cushion of cotton, felt or other absorbent. The block or tube must be at least ⅛ inch thick for bottles of 8 ounces or less and at least 3/16 of an inch thick for bottles holding more than 8 ounces. The container must be rendered water-tight by an application of paraffin or other substance to the inside, and must have a screw top, with a washer so that no liquid can escape if the bottle should be broken. Such bottles may also be packed in tight receptacles of wood, metal or waterproof corrugated pasteboard, if surrounded with bran, sawdust or other absorbent in sufficient quantities to absorb all the liquid if the bottle is broken. Larger bottles may also be shipped, if packed in strong boxes surrounded with sawdust or other substance which will prevent breakage, but must be marked "Fragile. This side up," and must be transported outside mail bags.

FOREIGN

Japanese Mission to Study Typhus.—The *Policlinico* reports that a party of Japanese physicians, in charge of Dr. K. Mogi, has arrived in Roumania to study typhus. The party expects to remain eight months for the purpose.

Carnegie Hero Prizes for Civilians.—The *Riforma Medica* relates that among the prizes distributed recently at Rome by the board of the Carnegie Foundation were some to the nuns who have charge of the city hospital at Udine, in recognition of their devotion in remaining at their posts and tending the sick and wounded during the recent bombardment of the hospital.

Scabies at Amsterdam.—Scabies is so prevalent now at Amsterdam that two dispensaries have been arranged and another is planned to which all the scabies patients are sent. The other members of the family are given treatment also, and the bed and body linen is disinfected. The authorities hope to stamp out the epidemic before the increasing scarcity of sulphur will render treatment more difficult.

Dogs Trained as Guides for the Blind.—The *Hospitalstidende* quotes a German exchange to the effect that an institution was organized in 1917 in Germany to train dogs to serve as guides for the blind. Dr. Bauer is in charge of the work, and he recently exhibited five dogs that had finished their training. They not only serve as guides but warn the blind man they are leading of every obstacle, watch out for anything he may drop, and, in short, it is said, serve as a friend and protector as well as guide.

A New Enslaving Drug.—The *Nederlandsch Tijdschrift* states that the combination of morphin, cocain and caffein which is marketed under the name "trivalin" is sowing addictions broadcast, as the advertisements state that the combination deprives cocain and morphin of their dangerous properties. Müller of Godesberg recently reported that he had had occasion to treat eleven cases of addiction from this drug. The consequences and symptoms are those mainly of cocain poisoning. All the patients had been given the drug first by a physician with the assurance that it was less harmful than the opiates. The odor of valerian about the drug is an advantage as this would deter some from using it.

American Poets' Ophthalmic Ambulance.—The *British Medical Journal* describes the ophthalmic motor ambulance given to the Italian army by the group of American poets. It was designed by Professor Busi of Bologna and Major Balestra, and the whole packs into a trolley of the dimensions required by the railway authorities. It provides a small operating room with wooden walls and roof covered with impermeable canvas, and a waterproof tent mounted on iron frames with a rainproof roof. This forms the reception room and also on occasion a radiologic cabinet and ophthalmoscopic examination room when it is covered inside with black cloth. The *Riforma Medica* states that the ambulance has been completed and has already left for the front in charge of Major Alfonso Neuschuler.

Premiums for Breast Feeding.—The *Nederlandsch Tijdschrift* quotes a Berlin exchange to the effect that the number of women nursing their children nowadays is much above the average before the war. The infant death rate shows a corresponding decline. The authorities ascribe the greater prevalence of breast feeding to the premiums given nursing mothers. Each mother has to apply weekly for the premium and bring the child, and consequently an opportunity is thus afforded for instructing the mother in the care of the child. This combination of premiums and consultations is proving of the greatest advantage in reducing the infant death rate. It is suggested, however, by the *Tijdschrift* that the scarcity of food for the children may have something to do with the increase in breast feeding.

Public Warning Against Venereal Diseases in the Netherlands.—The *Nederlandsch Tijdschrift* gives the text of a circular of about 400 words warning of the dangers of venereal disease for the individual and for the nation, and the importance of early and thorough treatment. It is issued by the Public Health Service of the Netherlands, sanctioned by the minister of the interior, and it is to be made public throughout the country, although it is not mentioned how this is to be done. It is emphasized in the circular that, "generally speaking, there is no danger from the venereal diseases for those who refrain from extra-conjugal sexual relations, but that the danger of contracting venereal disease is greater now than ever before, as the war has brought about unprecedented conditions in our land also, and brought into the country many foreign elements, including many undesirable elements."

Death of Forlanini.—The cable brings word of the death of Dr. Carlo Forlanini of Pavia, the inventor of the method of treating pulmonary tuberculosis with induced pneumothorax, aged 71. Until he reached the age limit he was professor of physiology and clinical medicine at the University of Milan, and was always interested in aerotherapy and medicopneumatic measures. It was in 1894 that he published what he called "The First Attempt to Treat Pulmonary Tuberculosis with Artificial Pneumothorax," and the following year published the "First Case of Monolateral Advanced Pulmonary Tuberculosis Successfully Treated with Artificial Pneumothorax." He has published numbers of works on this and other subjects, notably on venesection in treatment of uremia, on the influence of tobacco, alcohol, morphin and caffein on the arterial circulation in a case of a large gap in the skull, and on thoracentesis with introduction of filtered air (1902).

Discussion of Venereal Diseases in the German Senate.—The *Nederlandsch Tijdschrift* relates that a bill pending in the German Reichstag imposes a penalty of 10,000 marks or a prison term of one year on any who treats venereal disease without being a qualified physician. The promoters of the bill stated that with this penalization the bill must stand or fall. It was adopted in the committee by a vote of eighteen for and seven votes against the measure. In the discussion, one of the members insisted that the present laws against personal injury cover the subject, and that there is no need for further legislation. Another member remarked that many qualified physicians have turned aside from "school medicine," and that the worst forms of advertising were introduced into the world by physicians. He also stated that the working classes have lost confidence in "school medicine" on account of the treatment by the social insurance physicians of the insured, adding, "Qualified physicians are themselves to blame for the resort to the nature healers by such a large part of the populace." (There are said to be 12,000 nature healers in Germany at present.) Another member contended that whether there are ignorant or careless physicians has nothing to do with the bill. "The question is to determine the minimum of knowledge compatible with the treatment of venereal diseases." A penalty of 1,000 marks and prison term of six weeks was demanded for those who, knowing that they have some venereal disease, neglect to have it treated by some qualified physician. After much discussion this measure was adopted except that the fine was reduced to 500 marks and the prison term to four weeks.

SOUTH AND CENTRAL AMERICA, MEXICO AND WEST INDIES

Adulteration of Drugs.—The Public Health Service of Mexico has sent out notices to the governments of the different states warning against three falsified drugs which have been found in the City of Mexico. Pharmacists are warned to be on the lookout. One of the drugs is labeled benzonaphthol, but is merely calcium silicate; it bears the apocryphal label "Riethel." Another is simply acetanilid, labeled cocain chlorid from the Mallinckrodt firm at St. Louis. The third drug thus falsified is euchinin, which consists merely of calcium carbonate and a little quinin sulphate.

Deaths in the Profession Elsewhere.—**Dr. Sanchez Toledo**, a Cuban physician long practicing in Paris, aged 58. He was the representative of Cuba at various international gatherings, and during the present war has been serving in a Red Cross hospital.——**Dr. M. G. Zavala**, professor of obstetrics in the Facultad de Medicina of Mexico, aged 68.

CUBA LETTER

Havana, May 26, 1918.

Contagious Diseases in Cuba

One hundred and five cases of typhoid fever have been reported in Havana during the last month. Typhoid vaccine is supplied free of charge in all branches of the board of health department. In the interior of the island, typhoid fever has also shown an increase over the statistics of former months, but this small epidemic is by no means threatening, according to the health authorities.

Malaria does not exist in Havana except when imported from other communities, Oriente and Camagüey, where there are various foci to which the board of health is now attending. Last year, 133 malaria patients died in Oriente, and twenty-eight in Camagüey. Professor Guiteras, director of sanitation of Cuba, has proved that most of those cases were imported with the negro laborers who came to work in the sugar cane fields from Haiti and Jamaica.

The campaign against these two diseases is being carried on conscientiously, and their early control is expected.

Cuban Physicians and Nurses to the Front

The Cuban senate has passed a bill ordering 100 physicians and surgeons to go to lend their services in the Allied hospitals in France.

The Cuban Red Cross has selected twelve nurses, who will be sent to France after a short period of training.

Death of Dr. Sanchez Toledo

Dr. Domingo Sanchez Toledo, a Cuban physician practicing in Paris and a captain in the French medical reserve corps, died in France last month. He was a brother of Dr. Miguel Sanchez Toledo, professor of physiology in the University of Havana.

LONDON LETTER

London, May 14, 1918.

The Outbreak of Acute Infective Ophthalmoplegia

The outbreak of acute infective ophthalmoplegia in London and other places in England has already been described (The Journal, June 1, 1918, p. 1619). Some further particulars may now be given. Against the suggestion that it is the form of food poisoning known as botulism is the fact that a case has been observed in an infant at the breast and another in a vegetarian. Moreover, no one article of food has proved to be responsible. Some cases have simulated meningitis, and in others the suggestion has been made that the cases are poliomyelitis of unusual distribution in the nervous system. The duration of illness has varied from six weeks or longer to a few days. The onset of illness may be sudden or gradual. The one constant symptom is the rapid development of languor and drowsiness. This may be the most pronounced symptom throughout. The patient as a rule does not become completely unconscious. He lies in bed like a log, but is easily aroused. The respirations are increased in number. The pulse is not rapid. There is a moderate amount of pyrexia in the earlier stages. Muscular tremors, especially of the eyeball, are a marked symptom in some cases. Usually there is unilateral or bilateral weakness of muscles supplied by the third, fourth or seventh cranial nerves. Ptosis is very frequent. As a result of the weakness of the facial muscles, the patient's face commonly has a masklike appearance. Constipation is usual. Retention of urine frequently occurs. There is marked dryness of the mouth and throat, and may be some dysphagia. The mouth, as well as the general condition, may simulate uremia or the typhoid condition. Death, which has occurred in a large proportion of the severe cases so far observed, seems to be due to bulbar paralysis.

Ophthalmologists and Public Affairs

At a representative meeting of ophthalmologists at the rooms of the Royal Society of Medicine, it was decided to form a council to take action in matters of ophthalmologic interest in connection with public affairs. In proposing the resolution, Sir Anderson Critchett said it would meet a definite need and would tend to weld the elements of ophthalmology more closely together, as well as making for the welfare of the public. Mr. Richardson Cross seconded, remarking that governments and governing bodies require expert advice in order to be efficient, and that the best experts are those who enjoy the confidence of their colleagues in that special line of practice. Owing to the amalgamation of the journals devoted to ophthalmology into one organ, and the representation on the Ophthalmological Society of the various similar bodies in the kingdom, the profession is now well organized and can present a powerful front on all questions specially concerning it. He instanced ophthalmia neonatorum, navy and army visual standards, visual and lighting requirements in various kinds of industry, organized inquiries concerning the blind, grades on compensation payable according to degrees of visual disability, and so on. Mr. J. B. Lawford, in supporting the resolution, said that the days are rapidly passing when we can afford to ignore scientific discoveries and the new methods based upon them. He believes that more attention will be paid in future to the views of representative bodies, and less to the opinions of individuals, however eminent. The state is now more and more assuming the rôle of parent, and, like other parents, will be all the better for sound advice. He would like to see ophthalmology made a compulsory subject of the medical curriculum, a matter on which we are much behind other civilized countries. At present, a man receiving the minimal qualifying medical diploma can at once take up the practice of ophthalmology; and if the proposed committee should do no more than insist that men should not take up this work without special training, it would fully justify its formation. It was decided that the Council should consist of all the past and present presidents of the Ophthalmological Society of the United Kingdom, and of the Section of Ophthalmology of the Royal Society of Medicine as permanent members, four members nominated annually by the councils of each of these societies, and one representative from the Oxford Ophthalmological Congress.

Physical Deterioration of Boys Under War Conditions

In a letter to the *British Medical Journal*, a physician practicing in a munition area calls attention to the dangers that beset boys between the ages of 14 and 18 (that is, up to the military age) under the present abnormal conditions. Three or four years of absence of paternal control (because their fathers have joined the army), of practically unlimited supplies of money and cigarets, lack of sufficient sleep through frequent cinemas and music halls, and finally, in many cases a tendency to indulgence in alcoholic drinks, must all exact an inevitable toll on the growing boy. In many instances mere boys have become physical and moral wrecks. The trouble can be traced to the high wages, $15 or $20 a week, which these boys earn. For this the government is responsible. At the beginning of the war the obtaining of munitions in sufficient quantities was all important. In order to avoid trouble with labor, wages for piece work were fixed at a high figure, sometimes ridiculously high, so that unskilled persons were able to earn three or four and even more times the wages they received before the war. Probably for the same reason—a desire to avoid trouble with labor—these wages have never been altered. The physician in question suggests that no one under the age of 18 should be allowed to receive more than $7.50 a week, and that the remainder should be held in trust till the war is over.

The Latest Ambulance Train

A short time ago I described an ambulance train constructed in this country for the American Army which was then the last word in ambulance trains. But progress never stops. A train has just been constructed for the use on the continent, probably in Italy, and is being exhibited by Red Cross officials in London and other cities. In general design and internal arrangement this train closely resembles the one made for the American Army. Certain mechanical modifications were suggested by recent experience. Painted khaki color outside and white inside, this train is 960 feet long and weighs 440 tons. There are sixteen coaches, providing accommodation for 342 cot patients, besides infectious and mental cases in special isolation wards. There are also sitting and dining compartments for officers; staff, pharmacy, and personnel cars; two kitchen cars; refrigerating chambers for perishable food, store rooms, linen presses, and brake vans. The windows are fitted with "louvre" blinds covered with wire netting to keep out the flies, and ventilation and sanitation are carried out on the most approved principles. More than 3,000 gallons of water are carried on the train, and the two kitchen cars can supply about 50 gallons of hot water at any time. The train is electrically lighted and fitted with detachable electric fans throughout. It is steam heated, and the staff and personnel cars have a special self-heating apparatus which can be brought into use when the engine is not attached. The beds for the patients have been specially designed, and can, if necessary, be used as stretchers.

PARIS LETTER

Paris, May 9, 1918.

Plastic Operations on the Skull

At the request of the army medical department, this subject was discussed at a reunion of the members of the Société de neurologie de Paris and of the chiefs of the Centres neurologiques d'armées and de l'intérieur. Dr. Louis Mourier, undersecretary of state for the Service de santé militaire, presided. The conclusions contained in a report made by Dr. Georges Guillain, professeur agrégé à la Faculté de médecine de Paris and médecin des hôpitaux, were adopted by the assemblage as follows: Before a cranioplasty is done, the *trépané ancien* should be systematically examined from the neurologic standpoint. Cranioplasty is contraindicated when (1) there is present any nervous trouble connected with modifications in the circulation in the brain; (2) if the cerebrospinal fluid is not absolutely normal as to tension, chlorids and albumin content, and if it contains leukocytes; (3) if ophthalmoscopic examination discloses the existence of a papillary stasis or choked disk; (4) if the patient shows partial or general epileptic phenomena; (5) if the roentgen rays reveal an intracranial projectile; (6) if the patient has exhibited serious meningeal symptoms. In those cases in which the extensibility of the cicatrix seems to be the cause of nervous symptoms, it is wise, before undertaking any plastic operation, to make sure that these symptoms will disappear on the application of a protective external plate.

From the medicomilitary standpoint, any decision that may be taken should be based, above all, on the proper appreciation of the cerebral or mental condition. All reserves made so far as concerns the brain trouble, an extensive loss of cranial substance, whether a plastic operation has been done or not, does not mean, in itself alone, obligatorily and immediately, a retirement pension, but only, and during a period of four years, an invalidism with renewable allowance equal to a retirement pension.

Nerve Suture

The question of nerve suture was also discussed at this meeting. In a general way, in cases in which there is no evidence of the return of motion or sensation, an unfavorable opinion should not be given until two years have elapsed after the date of the suture. During this waiting interval the patient is invalided temporarily and examined several times by the same neurologist. In cases presenting evidence of a possible return of function, it is impossible to foretell the period of time that must elapse before the case can be pronounced incurable. The patient after suture should be treated in the same neurologic center in which the suture was done, and for as long as is judged necessary by the chief of the center. The latter is the one to determine, according to the case, the moment when the incurability can be shown. The réunion also passed a resolution to the effect that after sufficiently long treatment of those patients who show signs of progressive regeneration, the chiefs of the centers should be authorized to send them away either on repeated leaves of absence during convalescence or on renewable *congés de travail*, with return to the center for further examination and final decision.

Nerve Prostheses

It was also stated at this meeting that patients with nerve injuries supplied with prosthetic apparatus intended to remedy transient motor insufficiencies often continue to use such apparatus although certain movements have already returned. Some of those keeping on with the use of the apparatus believe that it is still necessary to their progress; others, although recognizing that it should be worn only temporarily, continue to wear it, either for ostentation or to hide the improvement which they have made. The réunion insisted that all men who have been using such an apparatus for more than six months should be examined in the center where it was ordered, to determine the necessity for further wear or to discontinue its use, and also to make such changes in its construction as may be needed.

Autochthonous Malaria

At the Réunion médico-chirurgicale de la III-e Armée, Drs. Grysez and Pierret reported on cases of malaria seen in the army during 1917, in which the diagnosis had been confirmed in the laboratory. Among the thirty-two cases there were twenty-four of autochthonous malaria. These patients had never had malaria previously, they had never been out of France, and they inhabited regions that were nonmalarial. In twenty-three cases the *Plasmodium vivax* was the cause; the *Plasmodium falciparum* was encountered in only one case. This particular patient had lived in Paris during peace times, had never been outside of France and had never had malaria before. He had been stationed for several months in the neighborhood of troops from Morocco and had contracted a tropical fever, confirmed by the presence in the blood of rosettes and crescents. Dr. Rieux discussed the symptomatology of primary autochthonous malaria. In the cases observed, the first impression was that they were not malaria but cases of typhoid and paratyphoid fever. Nevertheless, even then certain differential clinical signs were present which are not of the symptomatology of the last named diseases: the onset generally with distinct febrile manifestations; bilious vomiting, pulse rapid and thready; finally, the apparently contrary fever curve, with some falls of the temperature more or less brief in duration. These particulars are always important in the early clinical diagnosis of primary tertian malaria, which does not in its initial manifestations resemble the established tertian or double tertian type—secondary tertian malaria. If the clinical evidence is in favor of primary malaria, blood examination and the finding of the hematozoon will remove all doubts.

Primary Retarded Suture of War Wounds

Dr. A. Chalier of Lyon recently reported to the Société de chirurgie de Paris thirty-two observations of war wounds which he has treated by retarded primary suture, that is to say, not in the first twelve or twenty-four hours but after the thirty-fifth, the fortieth hour, even up to intervals of three, four, five and even eleven days. Up to the present it has been admitted that primary union of war wounds should be attempted only, with prudence, when the wound has been cleaned in a very thorough manner before the twelfth hour, in the preinfectious stage, and when systematic bacteriologic control has failed to reveal the streptococcus. Now, Chalier's cases demonstrate that the game need not be considered lost if the patient does not arrive in the first twelve hours, and even if bacteriologic control is not possible. In fact, in the absence of a bacteriologic examination it is often possible to decide whether the wound is seriously or only slightly infected by the aspect of the wound and surrounding tissues, and by estimating the general condition of the patient: An infected wound, in the bacteriologic sense of the word, may be only very slightly so from the clinical standpoint. These wounds can often be sutured, provided they can be kept under close surveillance. The thirty-two delayed sutures of Chalier's cases gave rise to only three occasions for reopening the wound. In the remaining cases the convalescence was uncomplicated and the final results were as good and achieved as rapidly as in the cases of early primary suture; the scars were linear and soft and nonadherent. Many of these patients rejoined their corps in less than a month, including even their leave of convalescence, in spite of the fact that these patients had been seriously wounded, with bone lesions in five cases and projectiles in the tissues in seventeen cases.

Chalier insisted that between early primary suture—the ideal method, and nearly always applicable in the cases in which operation is performed within twelve or twenty-four hours—and secondary suture, done later in cases that had previously been disinfected surgically, chemically or spontaneously, there is a place for a late primary suture, which is applicable only to certain cases in which there is only slight infection. Dr. Potherat stated that he, too, had treated by retarded primary suture wounds of the soft parts which had been inflicted three, four, five, six and even nine days previously. Dr. Pierre Delbet, professor of clinical surgery in the Faculty of Medicine of Paris, stated that he had recently treated some patients between twenty-two and forty-eight hours after they had been wounded. Several were infected bacteriologically but, in spite of this, he made a free excision and sutured the wound tightly without drainage. The results had far surpassed his expectations.

Cross of Legion of Honor for Military Nurses

Contrary to the custom in vogue as applying to civilians, the cross of the Legion of Honor conferred on army people carries with it pecuniary advantages (varying according to the degree conferred). It was recently decreed that these benefits should be extended, under certain conditions, to the military nurses and the Red Cross nurses mobilized in the *formations sanitaires* of the army.

Treatment of Bone Tuberculosis

The administration of the Assistance publique has decided, in accordance with a report made by M. Rendu, member of the city council, to establish at Salies-de-Béarn a center for the treatment of bone tuberculosis in children. Such children will be treated here as were sent during times of peace to Berck-sur-Mer.

Brazilian Medical Mission

A party of Brazilian military surgeons who came to France under the leadership of Dr. Rodrigo Bulcao for the purpose of studying the work of the Service de santé, have gone to the front.

Marriages

Major W. Wayne Babcock, M. R. C., U. S. Army, Philadelphia, on duty at Fort McPherson, Atlanta, Ga., to Miss Marian C. Watters of Swarthmore, Pa., June 10.

Lieut. Fred Lawville Rhodes, M. R. C., U. S. Army, Toledo, Ohio, to Miss Mary Z. Howard of Columbus, June 4.

Frederick William Jones, Verden, Okla., to Miss Blanche E. Armstrong of Oklahoma City, Okla., March 31.

Arthur Galloway Beall, Hutchinson, Kan., to Miss Hattie May Stewart of Kansas City, Mo., June 1.

Malcolm Robert Markson, Calumet, Mich., to Miss Irene H. Wright of Hancock, Mich., May 18.

E. Bert Wiley to Mrs. J. K. Scott, both of Helena, Mont., at Bozeman, Mont., May 17.

E. Freeman Robbins to Miss Maude Farrar Taylor, both of Houston, Tex., May 29.

Deaths

John Edward Jones, Altha Hall, Alexandria County, Va.; George Washington University, Washington, D. C., 1897; aged 51; consul and consul general at Dalny, Manchuria, in 1905 and 1906, consul at Winnipeg, Man., in 1907 and 1908, and consul general from 1908 to 1913; consul general at Genoa, Italy, from 1913 to 1915, and since that time consul general at Lyons, France; for sixteen years a member of the staff of the Washington *Evening Star;* died at his home, May 20, from nephritis.

George W. Berntheisel, Columbia, Pa.; Jefferson Medical College, 1866; aged 74; formerly a Fellow of the American Medical Association; a member of the Medical Society of the State of Pennsylvania; and once president of the Lancaster County Medical Society and Columbia College of Physicians and Surgeons; a veteran of the Civil War; president of the Medical and Surgical Staff of the Columbia Hospital; died in that institution, May 28, from cerebral hemorrhage.

Neil Jamieson Hepburn, New York City; College of Physicians and Surgeons in the City of New York, 1868; aged 71; a Fellow of the American Medical Association; and a member of the American Ophthalmological Society, and American Otological Society; consulting ophthalmologist to the Manhattan Eye, Ear and Throat Hospital, and the Paterson (N. J.) Eye and Ear Infirmary; a veteran of the Civil War; died at his home, May 28.

Alfred Wiles Schooley, Braddock, Pa.; Jefferson Medical College, Philadelphia, 1871; aged 70; a member of the Medical Society of the State of Pennsylvania; for nearly forty-five years a member of the medical staff of the Pennsylvania Railroad; also surgeon for the Pittsburgh and Lake Erie Railroad; dean of the medical staff of the Braddock General Hospital; police surgeon of Braddock; died at his home, May 24.

Nathan Ryno Garter, Baltimore; University of Maryland, Baltimore, 1879; aged 57; a Fellow of the American Medical Association; and a member of the Legislative Committee of the American Medical Association; for several terms a member of the state board of health; commissioner of health of Baltimore from 1913 to 1915; died at his home, June 1, from septicemia, following an infection of the throat.

Richard H. Smith, Kokomo, Ind.; Medical College of Indiana, Indianapolis, 1880; aged 72; a member of the Indiana State Medical Association; also a druggist; for many years coroner of Howard County; for several terms treasurer of the Howard County Medical Society and a member of the board of health of Kokomo; died at his home, May 29, from uremia.

Walter Darwin Williamson, Portland, Maine; University of Vermont, Burlington, 1888; aged 54; a Fellow of the American Medical Association; and once president of the Maine Medical Association; a member of the surgical staff of the Maine General Hospital, and of the National Association of Railway Surgeons; died at his home, June 2, from nephritis.

Lieut. Wyvern Almon Coombs, M. C., Maine N. G., Westbrook, Maine; Bowdoin Medical School, Brunswick and Portland, Maine, 1913; aged 27; a Fellow of the American Medical Association; on duty at Camp Greenleaf, Fort Oglethorpe, Ga.; was thrown from his horse at Camp Greenleaf, April 20, and died from his injuries, April 23.

Lyman F. Babcock, Deadwood, S. D.; Rush Medical College, 1864; aged 79; formerly a Fellow of the American Medical Association; whose fifty-first anniversary in the practice of medicine was celebrated at the annual meeting of the Black Hills District Medical Association in 1915; died in the Yankton State Hospital, May 30.

Frederich Curt Harnisch, Chicago; University of Leipzig, Germany, 1890; aged 57; a Fellow of the American Medical Association; a specialist in ophthalmology; ophthalmic surgeon to Alexian Brothers', St. Elizabeth's, and St. Mary's of Nazareth Hospital; died in the Alexian Brothers' Hospital, Chicago, May 25, from heart disease.

David Miller Barr, Philadelphia; Jefferson Medical College, 1864; aged 81; assistant surgeon U. S. Army, and on duty at the Catherine Street Hospital, Philadelphia, in 1864 and 1865; later medical director of sanatoriums in Ocean Grove and Long Branch, N. J.; died at his home, June 2, from myocarditis.

Nicholas Berdan Van Houten, New City, N. Y.; College of Physicians and Surgeons, in the City of New York, 1867; aged 76; a member of the Medical Society of the State of New York; for forty years physician of Rockland County; died at his home, May 29.

Frank Wesley Searles, Mokena, Ill.; Northwestern University Medical School, Chicago, 1877; aged 65; formerly a Fellow of the American Medical Association; died March 26, six days after an operation for a malignant tumor of the pylorus.

Marcus Whiting, Bruce, Wis.; Rush Medical College, 1883; aged 57; formerly a Fellow of the American Medical Association; for many years a practitioner of Peoria, Ill., and alderman from the first ward; died at his home, near Bruce, May 22.

Joseph Alva McCullough, Steubenville, Ohio; Western Reserve University, Cleveland, 1878; aged 62; a Fellow of the American Medical Association; for eighteen years local railway surgeon; died at his home, May 23, from pneumonia.

Raoul S. Dossmann, Ville Platte, La.; Kentucky School of Medicine, Louisville, 1900; aged 40; formerly a member of the Louisiana State Medical Association; coroner of Evangeline Parish; died at his home, May 23.

William Thomas Goldsmith, Washington, D. C.; Medical College of Georgia, Augusta, 1853; aged 87; a surgeon in the Confederate Service during the Civil War; died at his home, May 25, from cerebral hemorrhage.

Lucius Norton Henry, Ripley, Ill.; Miami Medical College, Cincinnati, 1890; aged 48; a member of the Illinois State Medical Society; formerly a druggist; died in Kansas City, March 26, from gastric ulcer.

Samuel Hiatt Burnside, Wichita Falls, Tex.; University of Pennsylvania, Philadelphia, 1882; aged 62; a Fellow of the American Medical Association; died at his home, March 28, from cerebral hemorrhage.

Benjamin B. Fishburn, Lebanon, Pa.; Medico-Chirurgical College of Philadelphia, 1898; aged 47; while walking over a grade crossing in Lebanon, May 27, was struck by a train and instantly killed.

John Bennett, Fowlerton, Tex.; University of Louisville, Ky., 1910; aged 33; formerly a Fellow of the American Medical Association; died in San Antonio, Tex., May 19, from ptomain poisoning.

Isaac Todd Mullen, Chicago; University of Buffalo, N. Y., 1884; aged 76; for many years postoffice inspector in the railway mail service; died at his home in Chicago, May 12, from heart disease.

Seymour C. Williamson, Canisteo, N. Y.; College of Physicians and Surgeons, Baltimore, 1885; aged 77; for one term coroner of Steuben County; died at his home, May 21, from pneumonia.

William Pitt Dunbar, Campbell, Tex.; Vanderbilt University, Nashville, Tenn., 1880; aged 67; a member of the State Medical Association of Texas; died at his home, May 27.

Walter D. Chaffee, South Bend, Ind.; Hahnemann Medical College, Chicago, 1887; aged 52; died at his home, May 16, from nephritis.

Thomas Price Tisdale, Alameda, Calif.; Cleveland University of Medicine and Surgery, 1858; aged 88; died at his home, May 18.

Adin F. Large, Braddyville, Iowa; College of Physicians and Surgeons, Keokuk, Iowa, 1884; aged 64; died at his home, May 10.

George Alfred Hurst, Dorset, Ohio; Eclectic Medical Institute, Cincinnati, 1884; aged 70; died at his home, about May 12.

Adam Raymond Klein, Muscatine, Iowa; Jefferson Medical College, 1904; aged 42; died at his home, May 18, from pulmonary tuberculous.

John A. Read, Tecumseh, Kan.; Bennett Medical College, Chicago, 1871; aged 83; died at his home, May 16.

Harry J. Brandom, Hettick, Ill.; (license, Illinois, years of practice, 1877); aged 86; died at his home, May 5.

John F. McCarty, Briggs, Tex.; Louisville, Ky., Medical College, 1883; aged 82; died at his home, May 14.

Seymour E. Ball, Eagle Rock, Calif.; St. Louis University, 1903; died about May 9, from cardiac asthma.

Michael J. McTurnan, Rigdon, Ind.; (license, Indiana, 1897); aged 77; died at his home, May 20.

Correspondence

SERUM DIAGNOSIS OF SYPHILIS

To the Editor:—May I point out some fallacies in Dr. Noguchi's answer to my criticism of his proposed new method of performing the Wassermann test in Army and Navy laboratories?

It is true that the presence of native antisheep amboceptors in human serum may cause errors in the Wassermann test when performed with a sheep hemolytic system. His statement, however, that this factor is uncontrollable is not correct. As a matter of fact I am quite certain that most careful workers who use the sheep hemolytic system remove the native antisheep amboceptors from serum before testing it.

Dr. Noguchi frankly admits that with his method a moderately positive serum containing an excess of native complement may give a weaker reaction than would a serum with an average amount of complement. Then by what process of reasoning can he reach the conclusion that a weakly positive serum may not give a negative reaction under the same conditions?

Dr. Noguchi claims that there is no great variation in the complement content of human serums. This is certainly not in accord with the teachings of most authorities on this subject, and is not in accord with my own experiences. During the past two years I have made a large number of native complement determinations on serums which were to be tested in the raw state, and have found the variations quite considerable. A detailed report of this work is now in the course of preparation and will soon be published. It will be sufficient here to point out the fact that some of the procedures advised by Dr. Noguchi for his new test themselves betray a recognition of the existence of this wide complement variation. After the addition of corpuscles and amboceptor to his tests he incubates for one-half hour. At the end of this time some of his controls are completely, and some only partially, hemolyzed; as a matter of fact, a few may have been hemolyzed for from ten to fifteen minutes. Those serums which do not show complete hemolysis in the controls at the end of the half hour period receive another unit of amboceptor and are incubated for another half hour. Those serums which even then do not show a completed reaction are retested with negative human serum as complement. We here recognize variations in complement content ranging all the way from an amount sufficient to bring about complete hemolysis in fifteen minutes with one unit of amboceptor to an amount that will not complete hemolysis in one hour with two units of amboceptor. That these differences represent considerable variations in complement quantities will be readily appreciated by any one who has ever done a complement titration.

As an example of the importance that authorities place on the need of uniformity in complement strength, I may quote C. F. Craig (Observations on the Noguchi Modification of the Wassermann Complement Fixation Test in the Diagnosis of Lues in the Military Service, *Jour. Exper. Med.*, **12**, 726. This refers, of course, to the old Noguchi test). Craig adopted the Noguchi test but used inactivated serum, because he feared that with noninactivated serums a certain percentage of false positives would be obtained. He insists on the careful titration of complement and says, "A whole series of tests may be rendered valueless by a slight loss of strength in the complement."

Dr. Noguchi surely deserves the thanks of all laboratory workers for having devised the technic for preparing acetone-insoluble lipoids for antigenic purposes. I am ready to admit that a good antigen of this kind is usually more highly antigenic and less anticomplementary than one obtained by any other method. That it is anticomplementary, however, is evidenced by the fact that we make anticomplementary titrations on it. No matter what fraction of the anticomplementary unit we accept as our antigen dose, it always carries with it a corresponding fraction of anticomplementary qualities. As I have pointed out in my previous communication, the anticomplementary activity of antigens varies for different serums. Now then, given a serum with the minimum complement content, or one that in Dr. Noguchi's method requires twice the amboceptor dose and from two to four times the hemolyzing time that a maximum complement serum would, and which is unduly sensitive to the anticomplementary qualities of the antigen, it is readily conceivable that a false positive reaction would result.

Dr. Noguchi fails to see any objection to his procedure of adding a second dose of amboceptor to serums whose control tubes are not hemolyzed at the end of the half hour period. I would again refer him to the paper by Ottenberg mentioned in my previous communication, where he will find discussed the fallacy of the assumption that complement deficiency can be safely compensated for by amboceptor excess, and which, I am sure, will convince him that such a procedure is not a safe one.

After all has been said, the fact remains that Dr. Noguchi's proposed new test ignores a complement variation the maximum of which is represented by a hemolyzing time of fifteen minutes, or possibly less, with one unit of amboceptor and the minimum by a hemolyzing time of one hour with two units of amboceptor. If this is permissible, then all our conceptions of complement fixation tests must be revised. Then can a chemist also properly make determinations with sodium hydroxid solutions ranging all the way from a tenth normal to a fiftieth normal, and make all his calculations as though he had been working with a twentieth normal.

Dr. Noguchi's old test is a model of scientific accuracy compared with his present method. And yet Kolmer says, "A positive Wassermann reaction, however, is better evidence of the presence of syphilis than a positive Noguchi reaction, because of the possibility of false complement fixation occurring in the latter when active serums are used." With a good acetone-insoluble lipoid antigen he finds these false reactions to be about 2 per cent. McFarland says, "Unfortunately, it [the Noguchi test] seems to have the demerit of occasionally finding the reaction in negative cases, which is a serious defect." Kaplan says, "All things being equal, the method is fairly reliable, and in my hands gave a positive error of 2.5 per cent." These quotations represent the general opinion of authorities. If Noguchi's old method has a positive error of about 2 per cent., his new method surely has a much larger positive error and also, in addition, a negative error.

What a reflection it would be on science if considerably over 2 per cent. of all those of our Army and Navy who will be subjected to complement fixation tests were to be falsely stigmatized with syphilis. Surely these men now face enough hazards without adding this one. I am still firmly convinced that to use the test proposed by Dr. Noguchi in Army and Navy laboratories for diagnostic purposes would be a great injustice to our soldiers and sailors.

J. J. SEELMAN, M.D., Milwaukee.

BÁRÁNY CHAIR TESTS AND FLYING ABILITY

To the Editor:—In an article on "Bárány Chair Tests and Flying Ability" (THE JOURNAL, April 13, 1918, p. 1064), we presented certain data concerning the Bárány chair tests of 100 naval aviators, and found an absence of correlation between the tests and the flying ability of the men. While, of course, the Bárány tests have in no way been intended to predict the flying ability of applicants for aviation, nevertheless, men who have failed to respond normally to these tests have in most instances, it is understood, been rejected, and rejected solely because of that failure. In other words, the tests have been used to predict inability to fly. If abnormal reactions constitute sufficient grounds for rejecting applicants, then perhaps it may be well to see what actually successful fliers do in a Bárány chair, and what, if any influence flying has on their reactions.

Table 1 shows the results of the nystagmus times of fifty aviators, all of whom were examined twice by the same examiner. The first examination was given before the man's flight instruction began, and the second after he had qualified. The interval between these two examinations varied from forty-six to eighty-eight days. The tables were compiled and submitted by Asst. Surg. C. J. Brown, U. S. Navy, at the Naval Air Station, Pensacola, Fla.

Nystagmus	
Normal in both examinations	26
Normal first, abnormal second	13
Abnormal first, normal second	2
Abnormal both examinations.	9
Abnormal in one or both	24

From this table it will be seen that at the first examination thirty-nine of the fifty had normal reactions, eleven abnormal reactions, if we consider twenty-six seconds as the average duration of nystagmus in normal individuals and sixteen seconds and thirty-two seconds the lower and upper limits of normal nystagmus time. At the second examination twenty-eight were normal and twenty-two abnormal, thirteen aviators dropping into the abnormal class after flying, and nine giving abnormal reactions in both examinations. The abnormal reaction in all but one instance consisted of a nystagmus time of less than sixteen seconds. In 56 per cent. of the men, nystagmus time was very positively and definitely decreased following a period of flying. In The Journal, May 25, 1918, Lewis and Pike deny the actuality of the decrease in nystagmus time after numerous flights. They refer to mumps and syphilis as the probable causes in any cases coming to our knowledge in which nystagmus time has been diminished. We have been unable to substantiate either disease as the cause in any of the cases reported.

We are further informed by Assistant Surgeon Brown in his paper read before the Medical Society at Pensacola that in an examination of 250 qualified aviators, while their falling tests were normal in all instances, in 66 per cent. of the cases an abnormal past-pointing test was obtained. In an examination of 402 men who have qualified as fliers or are likely to qualify in the near future, Dr. Brown found but ninety-seven men with normal Bárány reactions.

Much the same sort of results are obtained in examining individuals whom we know have excellent senses of balance and equilibrium, such as whirling dancers and trapeze performers. This fact is also denied by Lewis and Pike in their article referred to above. We have examined only a very small number of these individuals, six in all, but in all of the six cases obtained abnormal reactions. They are given in Table 2.

TABLE 2.

	Nystagmus		Past-Pointing				Falling	
			To R.		To L.			
	R-LN	L-RN	RA	LA	RA	LA	R.	L.
E. H., whirling dancer	18	17	6	1	1	1	None	None
Mrs. E. H., whirling dancer	12	13	1	1	1	1	None	None
C. M., circus trapeze performer	19	19	3	2	1	2	None	None
E. S., circus trapeze performer	19	21	1	1	1	1	To right	To left
F. M., circus trapeze performer	12	17	2	1	1	2	None	None
O. J. S., circus trapeze performer	38	10	1	1	1	1	None	None

It is interesting to note that in five of these individuals there was no falling after whirling, in five the past-pointing was markedly abnormal, and in three, the nystagmus times were below normal, in two normal, although both below twenty-six seconds, and in one "mixed," that is, left nystagmus above normal and right nystagmus below.

We believe, therefore, that not only are we justified in our conclusion that abnormal Bárány reactions do not indicate inability to fly, but also that there is no correlation whatever between equilibrium tests as established in the Bárány chair and actual flying ability, and that flying and other practices requiring an acute sense of balance, if indulged in over a considerable period of time, have a very definite effect on the Bárány reactions. To what this effect is due, we are unable to say.

Prof. Raymond Dodge of Wesleyan University, who has for the past year been doing elaborate experimental work along these lines, says:

"The grounds of my scientific conviction that the nystagmus test does not indicate fitness to fly are both practical and theoretical. It seems incomprehensible to a psychologist that these fallacious sensory data, which are really worse than useless to a flier, should have been selected as a test of his ability to fly. It almost seems like a joke of the enemy physiologists to hinder our air service. I believe that it should be abolished as a test, since, while the results are scientifically interesting, they have no practical value in indicating fitness to fly."

Robert P. Parsons, M.D.,
Louis H. Segar, M.D.,
Cambridge, Mass.

"PROTECTION AGAINST LICE"

To the Editor:—Objection from an influential source—medical, military and editorial—has been made to the use of fats for the inunction of troops in the trenches as a protection against body lice, as suggested by me in The Journal, May 11, 1918, p. 1395, and space therefore is asked for reply.

The proposal is held to be unworkable if applied to immense bodies of men as there are required, say, 50 tons of grease for an army of a million men; but this objection hardly meets the point made in my former note.

It is assumed that troops on leaving training camps, etc., are free from external parasites. The infectious peril from lice lurks at the front wherever fatalities or casualties with severe shock among infested men occur, be they friend or foe. If a body of relieving troops should be thoroughly anointed just before quitting camp, and this performance repeated at the front as opportunity offered, the extremities especially being treated, it could be said with reasonable confidence—taking no account whatever of the two forms of *dangerous infection* for which such lice are responsible—that relief of the American soldier from the moral repugnance, the physical nuisance and the nagging caused by these pests would add perhaps 10 per cent. to his effective fighting power. Such anointing would also tend to reduce the ill effects of exposure to cold and wet in the trenches, would conserve body heat, and otherwise would strengthen resistance.

The use of fats and oils by natives of both arctic and tropical regions seems natural and instinctive, the aim in part being defense against parasitic vermin, together with conservation of body heat in the cold regions, and the tempering of atmospheric heat in the tropics.

In a paper by me, read at the Third Pan-American Medical Congress in 1901, discussing insect parasites and their agency in the spread of disease, the following sentence occurs: "The prompt decamping of lice from the bodies of the dying or dead is a fact well known to those familiar with the personnel of numbers of those unfortunates who seek or are brought to large public hospitals, and that such mobile parasites may not carry with them . . . the active elements of recognized infections would seem impossible when the capacity of other parasites is considered in this connection." The assumed fact of general knowledge among physicians of the migratory range of body lice seems to have been overstated in the foregoing quotation; for, to many medical men, it appears to be a novel proposition.

I am indebted to Major Garrison, of the Army Medical Museum and Library, for a reference that bears somewhat on the point mentioned. It is found in the poem, "The Death of Philip II," by Paul Verlaine. The pertinent lines, as translated, read:

A gaunt old man, on the bed stretched supine,

. . . .

His throat sends forth a shrill and hollow wail,

. . . .

And his foul lips a fearful stench exhale.
In his beard, as with blighted amaranth tinged,
Through his white hair, streaked with ruddier glow,
Beneath his yellowing lawn, with rich lace fringed,
Quick, cruel, hungry, swarming to and fro
To suck their sallow victim's blood unclean
The lice, in serried squadrons come and go.
This is the King, writhing in pangs obscene.

. . . .

And from a thousand holes sprung in a trice
Like clammy serpents from their foul abode,
On the cold corpse worms mingled with the lice.
King Philip was . . .

Realistic as is this rendering, it is said that it lacks something of the morbid Frenchman's biting flair. The poet naturally missed the point that the vermin were in exodus—deserting the sinking human bark—but the sources of his information no doubt were also ignorant of this fact. The worms mentioned presumably were maggots escaping from fly-blown, gangrenous ulcers. Rats having plague pneumonia come out of their holes to die, bearing infected fleas which soon decamp to other hosts; and such an appearance of rats unfailingly foreruns pandemic plague—bubonic or pneumonic—among oriental peoples.

It would be a fair test of the value of the suggestion made as to lice if two companies or battalions of the same regiment, doing similar duty in camp and trench, were selected—one to use the inunction method, the other to take chances as they come. A month's experience of thorough application in trench conditions would probably demonstrate whatever value fat may have in preventive hygiene; and, if found effective, such personal use by the soldier of this means should become as obligatory as is the proper care of his weapons and equipment.

George Homan, M.D., St. Louis.

[Comment.—Any result produced by fats will no doubt be obtained equally well with the cheap and abundant liquid petrolatum.—Ed.]

SCHOOLS OF PHYSICAL EDUCATION FOR RECONSTRUCTION AIDES AND THE MEDICAL PROFESSION

To the Editor:—The tendency in medicine is toward more activities for prophylaxis and hygiene. When one talks to members of the exemption boards he finds that they believe many of the rejections for heart disease and frequently for tuberculosis would have been avoided if the men had received proper hygienic attention, particularly of the mouth, in childhood. Hygiene, however, concerns not only the mouth, but also the whole body and is an important feature in the physical education of children. The war has brought to our attention more strongly the importance of good physical development of the men of draft age. We cannot have strong young men, however, unless they are properly developed during childhood and youth. The serious consideration of this question is of such national importance, and concerns the work of the medical profession so closely, that the American Medical Association should assert itself in its solution.

There is no doubt that, in certain portions of the country, particularly in the East, some members of the profession take an active interest in this question; but the whole country, the whole profession, needs to be aroused.

The legislators of certain states (New York, New Jersey and California) have realized the importance of the matter by passing laws to the effect that all children during their school age must have a certain amount of physical exercise during the day as a counterbalance against the effect of the confinement in the schoolroom. Recognizing the importance of exercise for children, one naturally asks, Who will conduct this part of their education? How are we to get good gymnasium teachers? Have we proper normal schools for the training of teachers and playground directors? Perhaps few physicians are aware that there are today more than twenty schools of physical education with more than 3,000 pupils in this country. As several of their studies are medical in character, it would be proper that the American Medical Association give more attention to their work, assuring for instance, that their standards are high, and that their graduates will do scientific and hygienic work.

In this connection there is an important question that demands immediate solution with reference to the war. When the reconstruction hospitals begin their activities, massage and reeducative exercises will be an important feature in their work. Where will we get operators to fill these places? The Surgeon-General's Office, no doubt, feels that all the nurses we have will be needed for other work, and has thought that the normal schools of physical education could help provide what they call "orthopedic aides" and has advised some of them to give suitable courses.

[Comment.—The Surgeon-General has announced regulations for the examination of applicants for these positions, who must be graduates of training schools for nurses and furnish one letter of recommendation from an orthopedic surgeon and another from the principal of a school who knows the applicant personally. The Surgeon-General refers women who wish to take this training to the following certified schools: American School of Physical Education, 44 Botolph Street, Boston; Boston School of Physical Education, 105 South Huntington Avenue, Boston; Posse Normal School of Gymnastics, 779 Beacon Street, Boston; New Haven Normal School of Gymnastics, 1446 Chapel Street, New Haven, Conn.; Normal School of Physical Education, Battle Creek, Mich., and Reed College, Portland, Ore. The course of training comprises instruction in anatomy, physiology, personal hygiene, the theory of massage and remedial exercises, theory of bandaging, and practice in the last three subjects.—Ed.]

These aides to the surgeons in the reconstruction hospitals might be made really useful if their training was made as practical as possible. They ought to know the large features of kinesiology, the normal movements in the various joints, and the normal action of the various muscles so as to be able to apply their activities in massage and exercises in a fairly intelligent manner. While these things can be learned in a fashion on a skeleton and from books and lectures, it would be much better for them if they had had an opportunity to see and work on actual patients. If the profession took up this question through the medical schools and hospitals, working in conjunction with the existing normal schools of physical education in the large cities, we should at least be able to develop this class of help for the restoration of injured soldiers better than has been done in Canada.

The whole subject naturally requires serious consideration and a good deal of active cooperation between elements that are perhaps more or less strange to each other now; but such cooperation ought easily to come within the range of possibilities. When the "aides" are once at work, a certain amount of time should be arranged for their future instruction by means of lectures from members of the hospital staff, who will explain the important features of operations made on patients they are treating and what the aim and possibilities are for the work that they are to perform.

Hugo Ad. Oldenborg, Chicago.

CARELESS METHODS IN FITTING ARTIFICIAL EYES

To the Editor:—It may not have occurred to the readers of The Journal, as it had not to me until recently, how insanitary are the methods employed by the dealers in artificial eyes. Many surgeons in order to avoid the commercial element of selling something to a patient have been in the habit of referring those requiring ocular prostheses to opticians who keep artificial eyes in large quantities. This has seemed the more reasonable, moreover, because almost invariably after the first eye is fitted our patients go directly to these dealers to have them replaced.

In a case recently referred to one of the best of these, an acute purulent conjunctivitis was developed within twenty-four hours. An examination of the discharge revealed the presence of streptococci, staphylococci and pus cells. While the condition was rapidly controlled, it emphasized the careless methods employed. The shells, having been tried in many eyes, are frequently returned to the case without even being washed, to say nothing of being cleansed in a sterilizing solution. They are then indiscriminately placed in the orbit. When one recalls the numerous conditions for which eyes are removed, including syphilis and gonorrhea, it is apparent that our boards of health should institute protective measures requiring the thorough cleansing in a sterilizing solution of each artificial eye before it is inserted in the orbit. It is rather remarkable that more frequent infections have not been reported.

F. Park Lewis, Buffalo.

NEED OF CAMPAIGN TO AROUSE INTEREST IN TRAINED NURSING

To the Editor:—An editorial in The Journal (June 8, 1918, p. 1768) under the title, "Nurses Needed by the Red Cross," calls attention to the campaign now under way for the enrolment of 25,000 nurses for the Army and Navy, in addition to those already in service, between 10,000 and 12,000.

In this locality the earlier responses have been prompt and the enrolment so heavy that it is difficult to see where our proportion is to come from. Hospital service has been seriously impaired, and there are but few nurses available for work in private homes. The "practical" nurse to whom the editor refers has been so displaced in recent years by the trained nurse that she cannot be counted on for much help in the present emergency.

A most serious aspect of the situation is the shortage of pupil nurses in the training schools. Young women are going to work in greater numbers than ever before, and are entering lines that have heretofore been closed to them; but now, when the demand for their services is greatest, there is a most deplorable lack of pupil nurses in the training schools.

To arouse interest in trained nursing among the qualified young women throughout the country, would it not be practical for the Red Cross to put on a campaign, nation wide in its scope, to stir up interest in trained nursing as a profession?

Such a campaign would direct the minds of many young women to this great need, and the depleted ranks of the training schools would be filled, to the end that, when future demands are made for nurses, a supply would be available.

J. M. Mason, M.D., Birmingham, Ala.

Queries and Minor Notes

Anonymous Communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted, on request.

DICHLORAMIN-T

To the Editor:—I am interested in the use of Dakin's dichloramin-T solution in ocular infections as considered in the article by Drs. A. S. and L. D. Green (The Journal, April 27, 1918, p. 1212). Will you kindly inform me how to make the solution correctly? 1. What kind of oil must be used—plain or modified? 2. Does not the substance sold by druggists as dichloramin-T change in its composition? 3. Is it weighed or measured? 4. Does it last a long time if well preserved?

C. Viesca y Lobaton, M.D., San Antonio, Texas.

Answer.—1. See The Journal, June 8, 1918, p. 1788.

2. Dichloramin-T is stable when protected from moisture and light.

3. The term "per cent." is commonly used to signify per cent. by weight, though in the United States it is sometimes used with the intention that solids be weighed and liquids measured. In the present case it would make little difference whether both the dichloramin-T and the solvent were weighed or the first weighed and the second measured.

4. No; solutions should be as freshly made as possible.

"THE HONOR ROLL"

To the Editor:—I note the "Military Medical Honor Roll" in The Journal of June 1, and it is very commendable. It does seem, however, as though those of us who responded to the call for medical men for the Army and Navy, offered our services and were refused on account of physical disability, should have some suitable recognition, also. As it is now, we are classed among the goats.

V. A. C., M.D., Milwaukee.

To the Editor:—In looking over your "Honor Roll" in the current issue it appears to me that you do an injustice to the men who have volunteered and been discharged since you do not include their names. Turn to Wilkin County, Minn.: I was the first one to accept a commission. I was discharged in order to have a complete mastoid operation performed followed by a complete ophthalmoplegia with divergent strabismus. There are many more like myself, and I think we deserve some notice. Please omit my name.

X. Y. Z.

To the Editor:—In the issue of The Journal for June 1, 1918, you publish a list of physicians who have volunteered or have gone into service in the Army or Navy. What about the men over draft age who have volunteered and have been honorably discharged on account of physical disability, which is always stated to have existed prior to entering service? I am one of that class, and was discharged, Feb. 5, 1918. I was reexamined, May 24, 1918, at Camp Pike, Ark., and am now waiting for a report from the Surgeon-General. It was through no fault of mine—the spirit was all right, but the flesh was weak.

A. E. Harris, M.D., Little Rock, Ark.

Answer.—As was announced in The Journal, the "Honor Roll" was limited entirely to those who hold commissions. The primary object in publishing it was to show whether or not each county, district, state, etc., has furnished its quota.

For this reason it does not include the names of those who have volunteered but who, for one reason or another, did not hold a commission at the time our statistics were closed. For example: A county has 100 physicians. Twenty per cent.—that is, twenty physicians—volunteered. Five of the twenty were rejected or discharged for physical or other causes. This county, therefore, at the time of the publication of the Honor Roll still had to furnish five physicians for the M. R. C. in order to meet its quota. The fact that five had volunteered is immaterial; that particular county was still five short of its quota. As stated in the introduction to the Survey, a supplementary survey is in preparation for the use of the county and state societies. This, in addition to indicating those who have accepted commissions, will also give the names of those who have applied for commissions and whose applications are pending and those who have been rejected or discharged.

COTARNIN HYDROCHLORID

To the Editor:—The description of the actions and uses of cotarnin, as given in New and Nonofficial Remedies, was quoted in The Journal, May 11, 1918, p. 1396, in answer to a query. This description tentatively accepts certain current statements, in the absence of definite published data. I have now done some work with the object of supplying this evidence:

In a recent publication of mine (*Jour. Pharmacol. and Exper. Therap.*, 1918, **10**, 523) on this subject it was shown that perfusion of both uterine (guinea-pig) and frog's vessels (hind extremities) caused relaxation. When the drug was injected around the vessels of the rabbit's ears no change in the vascularity of the organ was noted. Direct application of cotarnin in solution and powder form to different kinds of superficial wounds invariably increased the bleeding. These effects have been confirmed recently by a quantitative method for estimating local bleeding.

Under the same conditions, epinephrin invariably produced vasoconstriction, and diminished or arrested local bleeding.

From this and other evidences in the literature it can be safely stated that cotarnin is entirely worthless as a local hemostatic. Its pharmacologic actions, and, hence, its hemostatic inactivity, are in harmony with its close chemical relation to the isoquinolin group of opium constituents, such as narcotin, from which it is derived.

Paul J. Hanzlik, M.D., Cleveland.

INSTRUCTION BOOKS FOR MEDICAL OFFICERS—TRAINING CAMPS

To the Editor:—I would appreciate information in regard to the following: 1. The names of books used for instruction of medical officers; where they can be obtained and the price. 2. Are there any other medical training camps besides Fort Riley and Fort Oglethorpe?

William E. Cody, M.D., Merrill, Iowa.

Answer.—1.

Manual for the Medical Department, 1916, Superintendent of Documents, *Government Printing Office*, Washington, D. C., 60 cents.
Field Service Regulations, 1914, ibid., 60 cents.
Army Regulations, 1913, ibid., 60 cents.
Drill Regulations and Service Manual for Sanitary Troops, 1914, ibid., 50 cents.
Straub: Medical Service in Campaign, P. Blakiston's Son & Co., 1012 Walnut St., Philadelphia, $1.50.
Havard: Military Hygiene, William Wood & Co., 51 Fifth Avenue, New York, $5.
Ashburn: Military Hygiene, Houghton, Mifflin Company, Cambridge, Mass., $1.50.
Ford: Medical Military Administration, P. Blakiston's Son & Co., Philadelphia, $5.

2. No.

ELIGIBILITY FOR SERVICE IN THE MEDICAL RESERVE CORPS

To the Editor:—Kindly inform me whether I am eligible for a commission in the Medical Reserve Corps of the United States Army. I was born in Hungary and came to this country eleven years ago. I am a citizen of the United States; received my naturalization papers in the year 1915; received my medical education in this country in a well recognized medical college. Please omit my name and address.

X. Y. Z.

Answer.—Physicians born in enemy countries are not eligible for commission in the Medical Reserve Corps.

WHEN TO WEAR UNIFORMS

To the Editor:—Is an officer who has been commissioned in the Officers' Reserve Corps of the United States Army permitted to wear his uniform before actually receiving word to report for active duty?

V. Everit Macy, M.D., East View, N. Y.

Answer.—Reserve Corps officers should not wear uniforms until ordered on active duty.

SERVICE AT BASE HOSPITALS

To the Editor:—I am classifying the diseases that have been noted in this hospital since its inception, and am interested to know what makes up the medical service in the war zone in the hope of making a comparison and study for our men who are in the base hospital here preparing for overseas duty. I shall be interested in any literature you may be able to furnish on the commoner diseases with which a base hospital overseas has to deal.

Willard C. Stoner, Major, M. R. C., Base Hospital No. 52,
Camp Gordon, Ga.

Answer.—The following articles on the work in a military hospital may aid you:

Summons, W.: Medical Work Seen in Australian Military Hospitals, *Med. Jour. Australia*, Sept. 22, 1917.
Mandel, Milton: Medical Impressions in a Base Hospital, The Journal A. M. A., Aug. 25, 1917, p. 637.
Hinds, R. W.: Medico-Military Notes, *Mil. Surgeon*, 1918, **42**, 25, 169.
Smith, L. L.: Diseases of War, Their Prevention, Control and Treatment, and Handling of Infectious Diseases in the Field, *California State Jour. Med.*, December, 1917.
Finley, F. G.: Medical Work at a Base Hospital in France, *Canad. Med. Assn. Jour.*, 1916, **6**, 692.
Thomas, J. J.: Neurological Cases Seen at a Base Hospital, *Jour. Nerv. and Ment. Dis.*, 1916, **44**, 495.

Book Notices

Ambulance de "L'Océan" la Panne. Travaux publiés sous la Direction du Dr. A. Depage. Secrétaires de la Rédaction: Dr. A.-P. Dustin et Dr. G. Debaisieux. Paper. Volume 1, numbers 1 and 2. Price, annual subscription, 30 francs. Paris: Masson et Cie, 1917.

This publication comprises a description of the foundation, the evolution and the organization of the hospital at la Panne. The hospital was hastily constructed on the seashore in the last remaining corner of Belgium after that country had been devastated by the Germans. The method of construction, the internal arrangement, and the subdivisions of the medical service are described in detail, including a description of the American Pavilion and of the Institute Marie Depage. All will remember the visit to this country of Mme. Depage, her efforts to raise funds for this hospital, and her tragic death at sea on her return trip. It is interesting to learn the purpose to which the funds raised here were put, and to know the great good which this hospital is accomplishing in the present crisis.

Following the description of the hospital in general are several chapters devoted to surgical subjects connected with the war, such as general considerations of the treatment of war wounds; secondary suture of war wounds treated by the Carrel method; intravenous injections of peptone in septicemias of traumatic origin and in grave infections; researches on blood pressure in gas intoxications; the prophylactic treatment of tetanus, and a number of other interesting subjects. These are all by members of the hospital staff, and indicate the high class of work that is being done in the institution.

Progressive Methods of Handling the Insane.—At the conference of civic organizers held at the Cincinnati Academy of Medicine, March 18, resolutions were adopted calling on the governor and the state board of administration to establish an institute of psychiatric research. It is asked that this institute be empowered to appoint directors who shall be of recognized authority in psychiatry and neurology, who shall supervise all institutions for the care of insane, criminal and epileptic, and who shall be empowered to devise a program from the improvement of the medical and scientific achievement of the wards of the state; to establish uniform methods and improve systems of care-taking and study; to establish clinical conferences both at the central laboratory and at the various state institutions; to conduct a central laboratory for the examination of pathologic material submitted by the physicians in the several state institutions; to take steps to bring the family physician in close touch with the progress and treatment of his patients in the state hospitals; to inquire into the state's facilities for establishing a visiting staff of specialists to supplement the work of the resident hospital staffs; to encourage work in psychiatry, and allied works in the state institutions; and to institute methods of encouraging therapeutic enthusiasm, and breadth of the social point of view in the members of the staffs of the various institutions.

Right to Recover Money Extorted to Protect Reputation

(Bertschinger v. Campbell (Wash.), 168 Pac. R. 977)

The Supreme Court of Washington reverses a judgment of dismissal and remands for a new trial this case, wherein the plaintiff sought to recover $1,025 alleged to have been unlawfully extorted from him by the defendant, and $125 as special damages incidental thereto. The court says that both parties were physicians, the plaintiff having lived thirty-three years in the city, where he practiced his profession and had built up a good practice. In December, 1912, a young man and a young woman called at his office and requested him to examine her with a view of determining certainly whether or not she was pregnant, they believing that she was then probably in that condition. The plaintiff was given to understand that, should he find the young woman pregnant, they desired that he perform an abortion on her. He consented to examine the young woman, but positively refused to perform any abortion on her. His examination convinced him that she was pregnant, and he so advised them. He then charged her $5 for making the examination. No abortion was performed on her by the plaintiff, and nothing further was ever done by him for her. But eleven days after the visit the plaintiff received from the defendant this letter:

> "Dear Dr.: A young lady lays dying from septic condition and incomplete abortion. She has made a full confession, you are charged with the crime. The confession is in my possession. In event of her death it will be turned over to the police. Confession is witnessed. I do not think she can last more than a day or so, judging by her present condition. I am very truly," etc.

The plaintiff immediately talked the matter over with his wife, then called up the defendant on the telephone, and went twice to see him, the latter time accompanied by his wife, who carried the money, which had been specially procured, to pay the defendant. After the defendant had the money, he patted the plaintiff and his wife on the back and said the danger was all over; the girl wasn't in a very serious condition at all; he thought everything would come out right, and in the event of her death he would protect them.

The trial court, on the defendant's motion, at the close of the plaintiff's evidence, dismissed the case on the ground that the evidence introduced in the plaintiff's behalf was not sufficient to support any recovery against the defendant, in that it conclusively showed that he voluntarily paid the money to the defendant, or on the theory that it must be determined, as a matter of law, from the facts shown in the case, that the plaintiff could not recover because the money was not paid under such legal duress as the law requires to be proved to avoid a contract, in that the plaintiff was not charged with the commission of a crime in any proceeding instituted in court, nor was he threatened with immediate arrest or imprisonment. But the supreme court does not agree with that view. Nor does it think it likely that, on a new trial, the defendant would care to invoke the defense, suggested in oral argument, that the payment of this money, under the circumstances shown by the plaintiff's evidence, was, in effect, the compounding of a felony, and that the agreement was so tainted with wrong and illegality that the courts would not lend their aid to the enforcement of the right claimed by the plaintiff, since that would imply that the defendant was himself equally guilty of compounding the crime with which he charged the plaintiff, and would seem to be an admission on his part that the money was received, as well as paid, for that purpose. But even that theory would still leave open the question of the plaintiff's having paid the money under duress; and clearly it would have been erroneous for the trial court to have dismissed the action on the ground that the payment of the money was for the compounding of a felony, in view of the evidence produced in the plaintiff's behalf. If the contract or settlement was void because of duress, it was not a binding one under which the defendant could retain the fruits thereof, even though it was also a contract which, but for the duress, would have been against public policy and as such could not be the foundation of any right to be asserted in the courts.

Itemizing of Account and Application of Payments

(Duffy v. Kilroe (Miss.), 76 So. R. 681)

The Supreme Court of Mississippi, Division A, in rendering a decree in favor of plaintiff Kilroe for the amount for which he sued defendant Duffy, administrator, for professional medical services rendered to a Mrs. Botto, holds that the plaintiff's account was sufficiently itemized, and that, properly applying in the payments which had been made on it, no part of it was barred by the three-year statute of limitation of Mississippi. The court says that Mrs. Botto was a woman of wealth whose home was in Mississippi, but who spent several of the latter years of her life in the city of New York, during which time she was suffering from a disease because of which she demanded and received the daily professional services of the plaintiff. The services rendered by him continued over a period of several years, and Mrs. Botto would make him payments thereon at intervals, which payments were credited by him on his books to Mrs. Botto generally, neither she nor he applying them to any particular items of the account due him by her. Mrs. Botto died, May 15, 1914. On the 19th of that month the defendant was appointed administrator of her estate. Jan. 16, 1915, the plaintiff's account for the professional services rendered by him to Mrs. Botto was duly probated, registered and allowed; but the administrator declined to pay it, and this suit was instituted, June 16, 1915. The lower court erroneously held that the plaintiff was entitled to recover only about half of the sum sued for, on the ground that the remainder was barred by the three-year statute of limitation. The account probated was of this form:

	Mrs. Frances M. Botto to Dr. Edward P. Kilroe, Dr.		
	To professional medical services rendered to said Frances M. Botto by Dr. Edward P. Kilroe at her special instance and request		$31,684.00
	Credits		20,085.00
	Balance due		$11,599.00
	Itemized Statement of Account.		
1908.	Day Visits, $5.00. Night Visits,		$10.00
April	63 visits at $ 5.00	$315.00	
	4 visits at $10.00	40.00	
			$355.00

The account was not filed with the chancery clerk at the time the bill of complaint was, but during the progress of the trial it was filed with and so indorsed by him. On objection being made that the account had not been made an exhibit to the bill, the court below permitted an amendment to be made thereto. Conceding, for the sake of the argument, that a copy of the account sued on should have been filed with and as an exhibit to the bill, there was no error in allowing the bill to be so amended as to refer to the account which was then on file, as exhibit thereto.

The objection was made that the account was not sufficiently itemized to comply with Section 2106, Code of 1906, Hemmingway's Code, Section 1774, as the dates of the plaintiff's visits to Mrs. Botto were not set forth. It was not necessary for the account to be so minutely itemized in order for the plaintiff to recover, but because of his failure to so itemize it, construing, as the court must, the account most strongly against him, the due date of each item thereof must be held to be the first day of the month in which it was charged, and the statute of limitation applied accordingly.

The payments made to the plaintiff by Mrs. Botto should have been applied to the oldest items of the account, and had this been done the plaintiff would have been entitled to a decree for the full amount claimed by him; for, under the facts presented, the statute of limitation ceased to run against the account at, and did not again commence so to do after, Mrs. Botto's death, and the payments made by her covered all of the plaintiff's charges for services rendered three or more years prior thereto. Under Section 3113, Code of 1906 (Hemmingway's Code, Section 2477), a debt not barred by limitation at the death of the debtor remains alive, in any event, for at least one year after the death of the debtor. If probated and registered within such year, the general statutes of limitation do not afterward run against it.

THE AMERICAN GYNECOLOGICAL SOCIETY

Forty-Third Annual Meeting, held at Philadelphia, May 16-18, 1918

The President, Dr. John G. Clark, Philadelphia, in the Chair

Medical Teaching and Research After the War

Dr. John G. Clark, Philadelphia: An adequate endowment or an annual budget of not less than $25,000 a year for salaries would render it feasible to combine the departments of obstetrics and gynecology. Some of the advantages of this plan are: (*a*) There will be less duplication of teaching in embryology and in the anatomy and physiology of the female reproductive organs. (*b*) The pathologic aspects of the two subjects could be correlated, making only one laboratory necessary. (*c*) As many of the diseases are referable to the child-bearing process, they may well be grouped under one head. (*d*) The opportunity is afforded of studying, in the obstetric department, the results of various operations and the remedial measures employed for the relief of gynecologic diseases.

When an endowment is not sufficiently large to equip fully and maintain a combined department in the most comprehensive way, or when special endowments for the maintenance of an obstetric and gynecologic department can be secured but are not large enough to allow the chief assistants and director to retire from private practice, such departments may be conducted more successfully as separate units, for the following reasons: (*a*) In a university medical school, special departments are likely to turn out a more refined product and to offer better instruction if the field to be covered is not too extensive. (*b*) When properly endowed, the department of gynecology may expand and enter the domain of general surgery. The chief function of the head of such a department is that of instructor in diseases of women and, in a minor rôle, of clinical teacher of abdominal surgery. (*c*) With separate chairs, more time can be given in the obstetric department to the teaching of the very important subject of diseases of nursing infants, a subject that is now receiving inadequate attention for the reason that the obstetrician has not time to devote to this branch.

Escape of Foreign Material from the Uterine Cavity into the Uterine Veins

Dr. John A. Sampson, Albany, N. Y.: A study of uteri in which the venous system has been injected with bismuth through the uterine and ovarian veins shows a rich venous plexus in the endometrium and also one in the myometrium, consisting of a peripheral and radial plexus. Arcuate veins between the two zones convey the venous blood to the uterine plexus between the layers of the broad ligament. Relatively large sinuses (receiving) radiate from the base of the endometrium into the myometrium, and convey the blood from the endometrial plexus into the deeper portion of the radial. If these receiving sinuses are exposed by removing the overlying endometrium, and the uterus is relaxed, thus holding the lumina of the receiving sinuses open, fluid and small solid material could easily escape from the uterine cavity into them and thence into the venous circulation outside the uterus. I believe that uterine contraction following relaxation, when there is obstruction in the cervical canal, and intra-uterine irrigation, may bring about increased pressure and force fluid, sterile or containing bacteria in suspension or placental cells, into the venous circulation, and that this is one way, and probably a frequent one, by which puerperal infection arises and placental cells reach the lungs.

DISCUSSION

Dr. George W. Kosmak, New York: The work of Dr. Sampson is a striking demonstration that we ought to stay out of the uterus as much as possible, because the invasion of this organ, particularly in the puerperal state and at other times, is attended with a great deal of danger. Observations that I made some years ago with reference to the extrusion of irrigating fluid through the fallopian tubes demonstrated this to me in a dramatic manner.

Dr. John O. Polak, Brooklyn: The demonstration of the protection of the endometrium against invasion from curetting the uterus is particularly impressive. Years ago we were taught not to operate during the menstrual period; yet, in the hurry of hospital work, we have violated that rule. Dr. Sampson has given us a clear idea of why in some cases we get infection.

Dr. Thomas J. Watkins, Chicago: This paper is of great value in bringing before us positive evidence against curettage of the puerperal uterus, and this society should put itself on record against any such procedure. It is surprising and shocking that many men continue to curet and wash out the puerperal uterus. Dr. Sampson has presented an excellent argument against it. He emphasizes the danger of increasing infection by curettage, and especially increasing the dangers of doing hysterectomy a few days after the preliminary curettage.

Dr. J. Wesley Bovée, Washington, D. C.: The work of Dr. Sampson confirms what I have been doing in the last few years, namely, discarding frequent curettage, but, still clinging to the necessity of having to invade the uterine cavity, injecting iodin into it. In two specimens in which I injected iodin previous to removing the body of the uterus within ten days for gonorrheal infection, I found iodin in the blood channels in the uterine body, so that caused me to discard injections of iodin.

Effect of Hysterectomy on Ovarian Function

Dr. Edward H. Richardson, Baltimore: The uterus is not essential to a continuation of ovarian fuction, except as regards menstruation and reproduction. The disturbances of ovarian function attributed to hysterectomy are partly those associated with normal menstruation and partly those arising from damage to the ovary through operative trauma or disease. The weight of evidence furnished by anatomic, experimental and clinical investigations is overwhelmingly in favor of retention of sound ovaries both before and after the menopause age.

DISCUSSION

Dr. Howard A. Kelly, Baltimore: It is best to conserve the ovaries or as much of healthy structures as may be retained in women who are under 40. In women of 40 or 42 it is best not to be so conservative. In the past we have decidedly overdone conservatism. If we can conserve either ovary and a portion of the uterus and keep up menstruation, if only for a year or two, it is a great advantage.

Dr. Walter W. Chipman, Montreal: Every effort should be made to care for the circulation of the ovary that is left behind. I plead guilty of not in the past having been sufficiently careful in this respect. I certainly am conservative in the matter of the ovary. If we can tell a woman after an operation that her sexual organs are preserved, it is a great psychologic comfort to her. It goes without saying that when the ovaries are diseased they should be removed. I have given up the resection of diseased ovaries.

Dr. Henry T. Byford, Chicago: It is important not to pay so much attention to the symptoms of the menopause. It is well not to enumerate these symptoms to patients, but to give them ovarian substance or extract; when they know they are getting it, the psychologic condition will be kept up, which is so necessary in these cases, and there will be less operating. With a little treatment and good advice, I do not think we shall have to do quite so much surgery.

(*To be continued*)

ASSOCIATION OF AMERICAN PHYSICIANS

Thirty-Third Annual Meeting, Held at Atlantic City, N. J., May 7-8, 1918

(Concluded from page 1791)

Bacteria of the Intestinal Tract

Dr. W. W. Ford, Baltimore: The gram-positive bacteria found in dejecta were found to be aerobic forms due to ingestion of milk, water, etc., and occurred in foods on which children are usually nourished. Gram-positive spore-bearing bacteria were normal to the intestinal tract. Anaerobic cultures were always negative. No encapsulated forms were present above the ileocecal valve. Below this valve there were present encapsulated gram-positive organisms of the morphology of the gas bacillus. In Baltimore milk there were present spore-forming gas bacilli. In the neutralized whey were found hemolytic substances due to bacteria. These were toxic for rabbits and guinea-pigs in subcutaneous inoculation. If the whey was filtered, the filtrate was also toxic. Milk cultures of the gas bacillus were always poisonous to animals. Work is now being done to determine whether this organism is vegetative in the intestinal tract and whether it bears any relation to the production of scurvy by the feeding of children with pasteurized milk.

DISCUSSION

Col. W. H. Welch, Baltimore: Has toxin been demonstrated in the milk, and, if so, was the carbohydrate content of the milk reduced? The reason the toxin is often overlooked is that if the carbohydrate is not changed the acid formed is destructive to the toxin. Search for the toxin must be made after the reduction of lactose.

Major Simon Flexner, New York: The factor influencing the degree of toxicity of the cultures that Dr. Ford has described is the control of the carbohydrate. There are differences at present unknown in the toxin-producing powers of the various strains of the Welch bacillus. Dr. Bull found one strain which was very superior to the others in antitoxin-producing power. In regard to milk cultures, the toxin-producing power must be determined not only in milk but also in other mediums.

Dr. W. W. Ford, Baltimore: I have tried two methods of increasing the toxicity of the milk cultures, to get milk whey in which lactose was taken away, but the gas bacillus did not multiply well in milk of that character; and to neutralize the acidity of the milk by the addition of powdered chalk. I found that the filtrate from such milk cultures was more marked in toxicity. In the study of pasteurized milk we were forced to limit observations to study of such organisms as might be obtained from this source. The gas bacillus obtained from soil and other sources would be more poisonous than that from milk. The variation of toxicity in strains was marked. It is premature as yet to attempt to answer the question as to whether pasteurized milk ever develops poisonous properties. In the majority of cases the gas bacillus exists in the intestinal tract in spore form, but observations so far do not indicate that there is any vegetation there. Probably the same thing holds good for the tetanus bacillus.

Practical Value of Diphtheria Toxin-Antitoxin Injections in Immunization after Three Years

Dr. William H. Park, New York: No death has occurred in 10,000 cases of immunization; four cases of collapse happened. Within the last six months no untoward results have been seen. Twenty per cent of children have shown a slight rise of temperature. From one to three units are given with perfect safety. In regard to the duration of immunity, it would seem as if artificial immunity in 80 per cent. of cases will be as perfect as natural immunity. Immunity has not dropped off more than 2 per cent. in two years. If it should be lost the child can be immunized again with equal effectiveness.

Studies of Chronic Myocarditis

Dr. H. A. Christian, Boston: In the recent studies of the heart by means of the electrocardiograph, there has been a tendency to emphasize the importance of the valve lesion rather than myocardial function. Most cases of myocardial insufficiency are called "mitral" insufficiency. The thickened valve is not differentiated from that with the orifice enlarged. The pathologist terms such cases myocarditis as have lesions demonstrable at necropsy, whereas the physician uses the word to mean myocardial insufficiency. Cabot some years ago found that only 22 per cent. of the diagnoses of chronic myocarditis, made during life, were correct at necropsy. My experience is that fewer mistakes are made in this diagnosis than in others. In analyzing the cases we found that there was a great frequency in incidence above 41 years. In 407 cases, 112 gave a history of rheumatism; 35 had a positive Wassermann; 110 were chronic users of alcohol; 178 had high blood pressure; one half the cases had chronic nephritis. Overeating as a factor was difficult to estimate, but 188 persons were overweight. The condition is evidently a very common one; the change is primarily in the heart muscle. The cause has not been determined. At necropsy a large percentage showed no changes in the coronary valves and no enlargement.

DISCUSSION

Dr. H. S. Plummer, Rochester, Minn.: We must consider if there is damage to the heart by overloading, either by high blood pressure or hyperthyroidism. The latter is a very common cause of myocardial insufficiency. I have recognized that one third of the cases are due to adenomas of the thyroid. These probably originated in fetal rests. These patients run a metabolism from 30 to 50 per cent. above normal, and this drops to normal with the removal of the adenoma. Blood pressure in these cases is due to increased minute volume flow through the right heart.

Dr. E. Libman, New York: One should try to find a cause for the myocardial insufficiency. If a history of rheumatism is present there may be a true myocardial lesion, but with syphilis the disease would be arterial. With diffuse atherosclerosis of the coronary system there must be muscular lesions to get myocardial insufficiency. One must see if the patient was anemic. Transfusion has often removed the cause of myocardial insufficiency. Bleeding fibromas, thyroid disease, etc., may be the underlying cause of myocardial insufficiency.

Dr. A. Stengel, Philadelphia: Myocardial insufficiency and myocarditis are two different things. In hyperthyroidism the patient is suffering from myocardial poisoning, but not necessarily from myocardial disease. The diagnosis of acute myocardial disease is exceedingly difficult to make. In the absence of evidence of valvular disease one is justified in saying myocardial disease, but many of these cases clear up when some focus of infection is removed, proving that the myocardial symptoms were but a manifestation of the toxemia.

A Study of the Empyemas at Camp Upton

Major H. Brooks, M. R. C., and Major R. L. Cecil, M. R. C.: We had a very virulent type of empyema. The cases were all associated with pneumonia. The disease was also associated with measles, but not with mumps. The causative germ was the streptococcus in 50 per cent. of cases, and in the other 50 per cent. the pneumococcus. Patients with pneumococcus empyema recovered after operative treatment. There were 49 cases of streptococcus empyema, with a mortality of 61 per cent. Of the four *Streptococcus viridans* cases, three patients died; four were mixed infections with streptococcus and pneumococcus, with no deaths. Of 35 hemolytic streptococcus cases, 22 patients died. The empyema seemed in each case to be a concomitant infection of the pleural sac. With the entrance into camp of a large contingent of colored troops the percentage of hemolytic streptococcus infections increased. With very careful isolation of cases there was found to be no diminution of occurrence. In the bronchial type of infection there was very little cough, very little sputum was raised, and very little pleuritic pain. The chief symptom throughout was prostration. The diagnosis was made by aspiration, confirmed by the roentgen-ray findings, and the changes in percussion were an important sign. The exudate in these cases had the appearance of alkaline urine and generally contained streptococci. Pericarditis usually developed early in these cases and was progressive, but there was lack of metastases elsewhere. Of 27 cases that came to necropsy, 23 were streptococcus cases. The pulmonary lesion showed interstitial bronchopneumonia, of the type described by Cole. Pneumothorax was also present. As regards treatment we found that early operations were fatal. It seems essential to wait till the pus becomes cellular in character, when operation can be performed safely.

DISCUSSION

Dr. H. A. Christian, Boston: In civil practice we had practically the same experience as has been reported in Army cases. Very frequently the streptococcus was the etiologic factor. The cases were the interstitial type of bronchopneumonia. Experience shows that fatalities occurred from too early operative interference. Some patients got well with repeated tappings of the fluid. The pneumonias had a tendency to shift in type and at first we were much disturbed with atypical forms, until we found that frequently we had to deal with the streptococcus.

Col. W. H. Welch, M. R. C., Baltimore: In civil practice streptococcus infections are most important. There existed at first a period of great confusion in regard to these cases. Investigations were then made by Drs. Zinsser and Dochez which brought out clearly that the streptococcus was the most important cause. At one camp the cases seemed to be due to the *Streptococcus viridans* and it was a question as to what had imparted to this streptococcus these unusual properties. What reasons have played a part in enhancing the virulence of the streptococcus? This is the most important problem today in dealing with infections of soldiers. In life the pulmonary lesion is frequently so mild as not to be recognized. In the infection through the respiratory tract the streptococci make way rapidly to the pleural passages, but no doubt they leave one or more small foci of the disease which can be detected on careful examination.

Major R. L. Cecil: In regard to the pneumococcus, cases were found with Type II in the sputum and Type IV in the pleural fluid. Of the streptococcus group four cases had shown nonhemolyzing streptococci. These were recognized as *S. viridans*. In the types of cases with mixed infection there was a mortality of 60 per cent. Often there were streptococci in the pleural field and pneumococci in the sputum. Empyema patients have plus cells in the fluid. Many cases showed localization between the left lung and pericardium and this probably explained the frequency of pericarditis.

Major E. P. Jocelin: Of fifty-five patients operated on, seven died. Operations were by simple drainage and no ostectomies were done. Twenty patients died without operation. In many cases several cavities were involved.

Hemosiderin Granules in Cells of the Urine: An Aid to the Diagnosis of Pernicious Anemia and Hemochromatosis

Dr. Peyton Rous, New York: In a soldier 46 years of age, with lesions of hemochromatosis, the diagnosis between this disease and syphilis was doubtful. There was enlargement of the liver and spleen and a peculiar gray pigmentation of the skin. The urine was found to contain considerable hemosiderin granules. The patient died within six months with characteristic signs of hemochromatosis. Fresh urine should be used for this test.

Thrombosis of the Coronary Artery

Dr. J. B. Herrick, Chicago: Death need not immediately follow obstruction of the coronary artery. Cases may be divided arbitrarily into four groups: (1) those with instantaneous death; (2) those in which death soon follows; (3) those in which death occurs weeks or months later; (4) a hypothetic group in which symptoms are very slight, being merely an obstruction of the twigs of the artery. The third group is important. In such cases patients frequently have had angina pectoris and they describe the occurrence of the coronary obstruction as the most acute and prolonged attack they ever had. The pain usually is referred to the epigastrium. Occasionally it simulates an acute abdominal syndrome, and careful differentiation is necessary as unnecessary operations are sometimes performed. In regard to experimental work on this subject, the ligation of the coronary artery in dogs has been done and the electrocardiogram studied. Dogs can live weeks and months after the ligation and may finally recover. In the experimental ligations the lesions were produced in the myocardium. They were most marked in the endocardial or subendocardial locality, or conductive region of the heart. Such phenomena as auricular or ventricular fibrillation were produced with changes in the electrocardiogram in the T-wave.

DISCUSSION

Dr. George Dock, St. Louis: I had a patient, a man, aged 61, who had never had occasion to consult a doctor for any illness and had been doing active work for forty years. He was a big eater but took little exercise. He was apparently vigorous, but medical men would look on him as arteriosclerotic. He denied syphilis and had no scar, but the Wassermann was + + + +, and it was found that he had a marked arteriosclerosis. After a Christmas dinner he was returning to his house and while climbing a small hill he felt a very severe pain radiating down the left arm; he was obliged to stop. The physician who attended him said it was angina pectoris with high blood pressure, and gave him nitroglycerin. The man went to work until January 6, when he had another attack and was brought to the hospital. He had air hunger to a marked degree and the larynx worked with extreme violence. Morphin and atropin relieved his symptoms. He never got over the orthopnea. Later he developed hydrothorax. Dr. Robinson took the electrocardiogram and without knowing that a diagnosis of coronary thrombosis had been made, he stated that the absence of the T-wave would suggest coronary obstruction. The patient died of double hydrothorax twenty-three days after the first angina pectoris attack. Postmortem examination showed very marked syphilitic arteriosclerosis. There was thrombosis of the descending coronary with an infarct three weeks old.

Dr. S. J. Meltzer, New York: It should be kept in mind that human cases are not identical with experimental ligation cases. One cannot be sure that the ligation was thorough enough or permanent enough. Ligation is not the same as thrombosis. It would be well to repeat the old experiments from a new light—to occlude the coronary artery with ligation.

Dr. H. A. Christian, Boston: In cases with symptoms below the diaphragm, which simulate abdominal conditions, a diagnostic point is the remarkable fall in systolic blood pressure. The diastolic pressure is little altered. The pulse pressure is strikingly small. In cases in which thrombosis takes place with very few symptoms, the patient, while sick, does not present a characteristic picture and his sudden death causes surprise.

Myrtol and Eucalyptol Poisoning

Dr. Lewellys F. Parker, Baltimore: In view of the fact that myrtol (a preparation closely allied to eucalyptol) is being used in the treatment of putrid bronchitis, it is worth while to mention that symptoms of poisoning have been recorded from these preparations. Myrtol and eucalyptol are both derivatives of myrtaceous plants. Eucalyptol poisoning has followed both overdoses and small doses of the drug, and it appears that some persons may have an idiosyncrasy to it. Two different syndromes have been noted in the aftereffects—first, nervous system involvement with collapse; second, dermatitis. In the nervous type the patient becomes seriously ill shortly after the dose. Vomiting, diarrhea and coma may follow. Vomiting must be induced to prevent further absorption of the poison. Skin lesions are often associated with the nervous lesions. Several fatalities have been reported from time to time. A greatly increased use of eucalyptol has resulted from its employment as a solvent for the neutral hypochlorite solution, dichloramin-T.

Comparative Food Value of Protein, Fat and Alcohol in Diabetes Mellitus as Measured by the Nitrogen Equilibrium

Dr. H. O. Mosenthal, Baltimore: In our experiments we desired to maintain the protein tissue in spite of using a carbohydrate free diet. The patient was put on 1,000 calories with a constant proportion of protein and fat. Then 500 calories of protein, fat or alcohol were added. Three periods were used—fat period, alcohol period, protein period. Finally there was a control period. On 1,000 calory diet there was a constant loss of nitrogen. With an additional 500 calories of fat there was no great improvement in the nitrogen balance. The fat was assimilated, but did not spare the protein. The same held true with alcohol. The alcohol possibly saved the body fat but not the nitrogen. The results with protein addition were strikingly different. The positive nitrogen balance was very marked indeed with 1,500 calories. Two patients who did not take the alcohol did not get the results. The fat and alcohol had been used to conserve the fat of the body, while the protein preserved the protein even on the protein and fat diet.

Relation of War Wounds to Acute Endocarditis

Dr. H. T. Karsner, Cleveland: I performed eighty-eight necropsies in a military hospital. Fourteen cases showed lesions of acute endocarditis following septicemia and pyemia. The organisms responsible were mostly streptococci. Three showed the *Staphylococcus aureus*. In one case the *B. perfringans* was found in the blood stream at death. These infections followed multiple extensive wounds, not of any particular type, but in cases in which an attempt was made to save the injured parts and the wound was allowed to drain pus for weeks and weeks. In the effort to save the joint, extensive damage was done to the heart and kidneys. In the later months of the war, an effort was made to determine whether the age of the soldier and the length of his term of service had any influence on these conditions. It was found that if the man was less than 27 years of age and had less than twenty-two months' service, the kidney weight and the heart weight were normal. The principal factor seemed to be the length of service, prolonged service leading to a great increase in the weight of the heart.

Trench Fever

Dr. Eugene L. Opie, St. Louis: This paper is the result of studies by Drs. Strong, Swift, MacNeal and Pappenheimer and myself. Two problems were studied: (1) infectivity of the blood: Of sixteen men inoculated with infected whole blood, fifteen developed trench fever. Of five inoculated with clear plasma, all contracted the disease. The corpuscles of the blood, then, does not carry the infection. Inoculations of plasma passed through a Berkefeld filter does not cause infection. Filtered virus, then, does not produce the disease. The inoculation period was from five to twenty days. The second problem was to determine whether lice transmitted the disease. Of twenty-two volunteers, bitten by infected lice, fourteen developed the disease. Eight volunteers, not bitten, did not develop the fever. Lice from trench fever patients were put on the volunteers and kept there thirty days till the fever developed. After forty-eight hours lice were removed from half of the volunteers and put on other volunteers, to exclude the possibility of mechanical transmission, directly from patient to individual. It was proved that the virus carried the infection. The lice were put on the arm in a piece of old undershirt, so that eggs and larvae were reproduced normally, and these were strapped on; the men were allowed to scratch so that normal skin irritation was produced. The inoculation period after biting was from nineteen to twenty-five days as compared with from five to six days with the plasma infection. The conclusions from these experiments were that (1) direct transmission is not essential; (2) if lice carry the disease, measures should be taken to combat it by eradication of lice; (3) the eradication of lice and by this means, eradication of the disease, is not impracticable.

DISCUSSION

Dr. Futcher, Philadelphia: I had an opportunity to see cases of trench fever in an English base hospital. Distressing nocturnal pain was a symptom of the disease. Sir David Bruce conducted some experiments in the Hampstead hospital. He found that if 500 lice that had bitten trench fever patients were allowed to bite volunteers, the results were negative as far as transmission of the disease was concerned. It was not stated how long the lice had fed on trench fever patients. In discussing these experiments it was asked if the patients had been allowed to scratch and it was found that they were prevented from scratching. Another series of experiments were then started. The arms of the volunteers were scarified. The lice were allowd to bite and the bodies of the lice were rubbed into the abraded surface. In seven days the volunteers developed trench fever. The experiments, however, as far as the biting was concerned, were not so conclusive as are those of Dr. Opie. It seems possible that there may be two modes of transmission—by the bite and by the excrement of the lice getting rubbed into the abraded surface. It is found in the trenches that lice leave the body of a trench fever patient and go to a healthy person. It is also necessary to determine whether the disease is transmitted from one to another by lice or whether it is a disease of the louse itself.

Dr. E. L. Opie, St. Louis: I have tried scarification experiments. It seems to add little to the knowledge obtained by injecting whole blood; but there is obviously a possibility of introducing the virus directly through the skin. The incubation period of seven days corresponds to that when whole blood is injected into the circulation.

MISSOURI STATE MEDICAL ASSOCIATION

Annual Meeting, held at Jefferson City, May 6-8, 1918

Dr. Robert E. Schlueter, St. Louis, in the Chair

Sterility Due to Retrodisplacement of the Uterus: Treatment

Dr. E. Lee Dorsett, St. Louis: The following have an important bearing: 1. Careful history taking and repeated examinations of both husband and wife to eliminate all other causes of the existing sterility. 2. The use of nonoperative measures before resorting to operative procedures. The use of both methods is oftentimes more successful than one alone. 3. The fallacy of the benefit of a curettement in cases of sterility; the injury to the endometrium caused by a curettement; care in the use of sounds and pessaries. 4. Selection of the operation to correct the condition of the cervix and the uterine displacement. 5. Importance of the after-treatment of all cases and reexamination after the patients leave the hospital.

Vaginal Drainage in Pelvic Cases

Dr. Frank Hinchey, St. Louis: Vaginal drainage, by the use of a tube through the culdesac, is not resorted to as frequently as it should be. The measure is absolutely safe and efficient and, perhaps, saves lives when the operator is in doubt as to whether or not he should drain. The indications for its use are: (1) When a suprapubic drain seems to be indicated; (2) when the intestine, a ureter or the bladder has been injured; (3) when a piece of suspicious tissue must be left in the pelvis, or infectious product has escaped; (4) when there has been much loss of blood—much traumatism, as in severe pus cases of ruptured ectopic pregnancies.

Though Yates has shown the futility of drains placed in the general peritoneal cavity, because of the formation of adhesions around the drain, the vaginal route possesses the advantage of being favored by gravity, and as the drain projects only a small distance into the peritoneal cavity the adhesions which nullify the usefulness of a suprapubic drain do not form. While, perhaps, it is not good surgery to use the vaginal route to attack abscess formations in the culdesac, because of the doubt of removing all of the trouble, cases occasionally arise in which this seems the only safe measure. But I disapprove of the opening of the vagina to evacuate abscesses, and immediately follow this with an abdominal section. Pelvic infections following pregnancy should, as a rule, be opened through an incision above Poupart's ligament because of danger of invasion of the general cavity. A split rubber tube, with gauze insert, is sewed with catgut at the opening in the culdesac and permitted to remain a week, or until the suture is absorbed. No douches are given.

Can We Disregard the Calendar in Setting the Date for Labor?

Dr. F. T. Van Eman, Kansas City: I have believed for years that one great source of trouble is the unfavorable proportion existing between the mother's pelvis and the child's head. Finally, taking advantage of the McDonald and Ahlfeld plans of estimating the maturity of the fetus, I began to induce labor at or near term, when the rights of the fetus seemed surely conserved, with results that seem very promising.

Passing of the Curet, or the Conservative Treatment of Abortion

Dr. George C. Mosher, Kansas City: In 1914 I became convinced that gynecologists had led the profession astray in regard to curettage. In my service all these patients are put in a modified Fowler position, given a large dose of magnesium sulphate, and an ice bag is applied to the abdomen. In the beginning the cases were differentiated as to streptococcus, staphylococcus or colon bacillus, but after a short experience no attempt has been made to discriminate.

The results of this conservative plan are remarkable. Taking 100 cases from the records of 1910 to 1914 when the curet was employed almost as a routine practice, the number of days in the hospital was 22.3. Now, in our new series the average is 8.5 days, a saving to the taxpayers of two weeks' expense on each patient, not to mention the benefit to the patient herself. The percentage of complications under the old régime was 70, including cellulitis, inflammation of the adnexa, abscess, and other forms of localized or general infection; under the new operative method complications are reduced to 5 per cent. The only indication for interference is hemorrhage, and the degree is to be weighed by the obstetrician. Packing under aseptic conditions is the treatment. Pituitary solution has not seemed to exert much influence in these cases, but it is not contraindicated. When used it should be given in dose of from ⅙ to ⅓ c.c. hypodermically. Morphin may be allowed, but only as necessary to relieve pain.

The Hodgen Splint in the Treatment of Fractures of the Femur

Dr. C. F. Sherwin, St. Louis: The Hodgen splint has proved highly efficient in the treatment of all fractures of the femur, at least above the lower third, and when properly applied and adjusted gives results vastly superior to most other appliances for such fractures. It is simple in construction and practically painless in application; requires no anesthetic or other procedure for "setting" the fracture, as the bone fragments are automatically pulled into place by the gentle traction, and the limb is kept at a constant length, easily verified and controlled by occasional measurements. It affords maximum comfort to the patient, permitting him to move about the bed, or even to another bed, lift his hips or even his body, and recline on the back rest or even sit up, if desired. It permits of observation and massage of the limb at all times, and of having any wounds dressed, all without the least pain to the patient or danger of injury to the limb.

The Hodgen Extension Suspension Splint

Dr. F. G. Nifong, Columbia: The Hodgen splint was never popularized as it should have been. All types of simple fracture of the femur, and likewise fractures with lacerated and septic wounds are successfully treated with the Hodgen splint. Modifications are easily made to meet various requirements. Simplicity characterizes the Hodgen splint. It immobilizes the site of fracture; it produces the necessary extension, which is the most important of all factors in treating long bones; it secures suspension, which is a factor of great value in wound treatment and of much comfort to the patient; it prevents muscle injury and paralysis by putting the limb at perfect rest in physiologic flexion; it mobilizes the limb as well as the patient, a very important consideration, especially in the aged; it is applicable to every form of fracture from the neck of the femur to the foot, simple and compound. As an emergency and transport splint the modification of the Hodgen splint cannot be excelled.

Painful Feet

Dr. Robert McE. Schauffler, Kansas City: Shoe manufacturers have in recent years put on the market a number of styles of shoes, or appliances to put in shoes, supposed to be designed on orthopedic principles, and many retail shoe shops have a clerk who is styled an orthopedic specialist to prescribe for foot ills. These devices are not entirely devoid of merit, but in view of the effort made to create the impression that an orthopedic clerk is sufficient for almost all foot problems, I have thought it would be of interest to study a series of consecutive cases of painful feet. Omitting all cases in which the foot trouble was only a part of the general disability of infantile paralysis or spastic paralysis, or of a multiple arthritis, and omitting congenital clubfoot, there remain eighty cases. These fall under thirty-nine heads. The three largest divisions are: Weak feet, eight; simple flatfoot, eight; flattened metatarsal arch, ten. This seems to demonstrate the need of scientific diagnosis and special treatment.

The Small Hospital in Rural Places

Dr. N. I. Stebbins, Clinton: Small hospitals may be made as efficient as large ones. Physicians associated with such institutions may be able to specialize along certain lines. They may have the privilege of roentgen-ray and laboratory work to assist in making a diagnosis, thus enabling them to do better work and obtain better results. The people should be educated to make more use of hospitals throughout the rural districts. The size of a hospital should not be a feature in the consideration of classification, but equipment, efficiency of the staff, and the records should be a basis for criticism.

Treatment of Cavernous and Plexiform Angioma

Francis Reder, St. Louis: A cavernous angioma is a soft, nonpulsating swelling, of variable size, with a thin covering of skin, usually bluish. Its great differential factor is that the entire tumor can be caused to disappear on pressure, with a prompt return to its original size as soon as the pressure is removed. Not so with a plexiform angioma. Pressure on the mass will not cause it to be evacuated completely. Well marked pulsation and bruit give it its differential characteristics from a cavernous angioma. In my series of 104 cases which have been treated by injection of boiling water, there were no failures. In most instances the results have been very gratifying. In the majority of the cases the lesion was on the face and scalp. Four patients presented angiomas on the tongue, ranging from the size of a filbert to that of an English walnut. One patient presented a lesion as large as a coconut on the left gluteal region.

Prostatic Enucleation

Dr. Leon Rosenwald, Kansas City: By enucleating the growth from the prostate there is very little hemorrhage, and the ejaculatory ducts are not injured. The two-step operation should be a routine measure. Cystotomy should be done under local and enucleation under spinal anesthesia. The latter is safer, gives more relaxation than general anesthesia, and avoids the suppression that follows ether. Furthermore, the ability of the patient to take large quantities of water immediately following the operation encourages kidney action.

Myositis Ossificans Traumatica

Dr. T. G. Orr, Kansas City: The symptoms of the type due to a single severe trauma are marked pain, rapid swelling and disability, followed in three or four weeks by a firm mass in the swollen area. The diagnosis is not usually difficult but must be distinguished from periosteal sarcoma. The prognosis is ordinarily good. After a few months of disability the bone formation ceases to increase in size, and there is usually some resorption of bone. The treatment should be conservative if there is not serious interference with function. After early operation there is very frequently a recurrence of the growth. I have had three cases, one a typical "rider's bone," one an ossification in the Achilles tendon following an open wound in childhood, and the third a typical example of intramuscular ossification in the quadriceps following a single severe injury while playing football.

8. **Treatment of Fracture of Spine.**—A study of twenty-five cases made by Brackett, Mixter and Wilson is strongly in favor of early operative action in cases of fractures of the spine. A large percentage of the cases which could be followed showed partial and even complete disability for years after the injury, many of which had prolonged mechanical treatment by fixation and support. It would seem, also, that the continuance of the mechanical support after a few months does not materially influence the result, but was of value in giving added comfort while wearing such support. This fact alone, namely, the failure of mechanical treatment, would seem to warrant active radical measures, provided the operative methods give reasonable assurance of benefit, and provided the indications for operation could be formulated. On the other hand, the results of early operative treatment, in the cases which have been watched would seem to indicate definitely that early operation is a measure to be advocated in a very large number of cases. The writers suggest operation in the cases which show the following conditions: 1. Fresh fracture: (*a*) Crushed fracture of the bodies of one or more vertebrae associated with disalinement of fragments, particularly with involvement of any part of the lamina; (*b*) fracture of the fifth lumbar, of any part, but particularly with involvement of the lamina; (*c*) fracture of body showing increasing knuckle, abnormal mobility at point of fracture, or complicated with rupture of the supraspinous or interspinous ligaments. 2. Old fracture cases which show the persistent disability, as evidenced by inability to work, accompanied by continuance of pain, local or referred, and with general back weakness, operation is advocated. Operation in the decade between fifty and sixty does not seem to be contraindicated. The social position may at times have influence in directing for or against operation, for when the most rigid early care can be given, much more might be expected from early fixation treatment. Freedom from pain, however, in the early weeks of recumbent and fixation treatment, may be misleading, for it is possible, that even with the relief of all symptoms during the period of recumbency, the pain may return and cause disability when the patient becomes ambulatory and begins to use the spinal column. A very severe injury and perhaps extensive crush may result in a quicker and more complete recovery than in some of the apparently lesser ones.

9. **Surgery of Spastic Paralysis.**—Gill has performed thirty-five Stoeffel operations on the popliteal, the sciatic, the obturator, and the median nerves. The results have been so satisfactory that the operations have been done routinely. In several instances a second operation was performed, when it was found that too little of the nerve supply had been resected at the first operation. It is better to resect too little than too much. In operations on the lower extremity the results have appeared to be almost uniformly successful and satisfactory. In resections of the median nerve of the arm the results are not functionally so good, although the cosmetic results are satisfactory. Following operation the after-treatment should be thorough and persistent in educating the weakened muscles and in securing coordination.

13. **Effects of Splenectomy.**—Hitzrot summarizes what is known about the anatomy, the physiology, and the clinical features of splenic disease, with special reference to the effect of splenectomy both in the normal and in the pathologic animals as gained by observations in seventeen cases of splenectomy (sixteen personal cases; one case reported by Conner and Downes). The series contains seven cases of splenomegaly of varying types (splenic anemia [Banti's], three; splenomegaly of unknown type with anemia, one; hematogenous jaundice, two; von Jaksch's anemia, one), two cases of pernicious anemia and one case of splenomyelogenous leukemia. Of the three cases of Banti's disease, one patient was markedly improved for nine months and then, due to the increasing cirrhosis of the liver, developed ascites, and in the fourteenth month a mesenteric thrombosis from which he died. The second splenectomy for Banti's disease is now six months past the operation, and is in splendid health and without symptoms. The third patient is serving in the army. As for the case of splenomegaly with anemia the patient has shown no change in weight since the operation. Her general health has improved, and three years after operation she reports that she is well but has a small baby and could not appear for examination. Both cases of hemalogenous jaundice have recovered from the symptoms which existed before the operation performed three and one half and eight years ago.

Following the splenectomy done for von Jaksch's anemia there was a rapid rise in the hemoglobin and in the red cells, which has remained permanent. The white cells showed no definite change following the splenectomy, and such changes as did occur took place in the polymorphonuclears, which rose in two weeks to approximately the normal polynuclear percentage (before operation they were only 25 per cent. of the white cells). One month after operation, hemolysis began at 0.50 and was complete at 0.38. Nine months after operation hemolysis began at 0.44 and was complete at 0.28, showing a marked increase in the resistance of the cell. The most striking feature of this particular case was the shower of nucleated red cells which was noted twelve hours after the operation. At one time (five days after operation) the nucleated red cells represented 85 per cent. of the nucleated cells in the smear. The child rapidly improved both in weight and height on exactly the same diet she had had before the operation, and in this case the effect of the splenectomy was even more striking than that procedure in the acholuric jaundice cases. The anemias in which there is a disturbance of blood formation cannot be benefited by splenectomy, inasmuch as the trouble does not lie in the spleen, but in the blood forming organs.

14. **Value of Pyloric Exclusion in Ulcers.**—Experiments performed by Lewisohn demonstrated *ad oculos* the efficient way in which pyloric exclusion sidetracks food. The changes produced in the chemistry of the stomach after gastro-enterostomy were not considered in these experiments. It is a well known fact that, following a gastro-enterostomy, bile and pancreatic juice are regurgitated through the stoma into the stomach, thus diminishing the hyperacidity considerably. This change of the chemism of the stomach is of the utmost importance. Lewisohn believes that improvements in the clinical condition after gastro-enterostomy without pyloric exclusion are based solely on the changes of the chemistry of the stomach. Gastro-enterostomy plus pyloric exclusion is however far superior to simple gastro-enterostomy. It gives the patient the benefit of the chemical changes just mentioned and, in addition to that, it safeguards the ulcers against mechanical insults, thus hastening the healing of the ulcer-bearing area

15. **Immediate Jejunal Feeding After Gastro-Enterostomy.**—Andresen has found that it is practicable, at the time of operation, to insert a previously swallowed Rehfuss gastroduodenal tube well into the jejunum and to commence at once, on the operating table, the feeding of peptonized milk, dextrose and alcohol mixtures, thus making sure that the nourishment administered actually is made use of by the body. Andresen considers that immediate jejunal feeding after gastro-enterostomy is not only a safe, but an extremely valuable, procedure and is to be recommended not only in the operations performed for stenosis but should be tried in all types of cases, as being a more certain, and, in most cases, a less uncomfortable method of postoperative administration of fluid and nourishment than the methods ordinarily employed.

16. **Developmental Reconstruction of Colon.**—In twenty-nine human cases of developmental reconstruction of the colon five have died, a mortality rate of 17 per cent. Four deaths occurred in the first eight cases. One death in the last twenty. Draper and his co-workers resected the terminal 10 cm. of the ileum and the cecocolon in block to the neighborhood of the right colic artery. This corresponds to a point on the transverse colon near to the right margin of the omentum. Indications for developmental reconstruction: 1. Segmental infection of the cecocolon. 2. In Lynch's elbow deformity of the mid-ascending colon when the peritoneum cannot be repaired after reduction. 3. In exaggerated nonfusion of mesentery, allowing such freedom of motion as occasionally to result in volvulus. Developmental reconstruction has superseded in their clinic all the earlier forms of operative procedure such as ileocolostomy, cecosigmoidostomy, etc., because it is no more dangerous operatively and gives better results because it removes the biologically decadent and diseased organ and restores the individual to the carnivorous type of colon undoubtedly best suited to man.

19. **Study of Hypogastric Artery.**—This paper, the third of the blood vascular tree studies, presents a composite study of the hypogastric (internal iliac) artery, and is based on records and observations made from dissections of ninety-three cadavers. There were ninety-one dissections of the hypogastric artery on the right side of the body and ninety dissections on the left side, making 181 dissections in all. Section A of this paper presents observations on the point of bifurcation of the aorta, and the length and point of bifurcation of the common iliac and hypogastric (internal iliac) arteries. Section B contains a description of the types of hypogastric artery. Section C embraces a description of the individual branches of the hypogastric artery. Section D summarizes and discusses the results of the study.

28 *Occurrence of Mitochondria in Red Blood Corpuscles During Experimental Anemias. C. O. Sappington, San Francisco.—p. 695.

21. **Blood Serum as Vasoconstrictor.**—The power of blood after clotting or defibrination to constrict blood vessels, as evidenced by its action on perfused organs or on the excised arterial strip, has been frequently observed and to some extent studied as to its nature and origin. The study made by Janeway, Richardson and Park consisted of the vasoconstrictor substance in relation, first, to unclotted blood; second, to the cellular and noncellular elements of the blood; third, to certain biologic, physical and chemical reactions; and lastly, to the process of coagulation. The results of this investigation may be summarized as follows: Uncoagulated blood of the ox or calf has no constrictor action on the excised strip of the ox carotid. Blood platelets of ox, dog or pig yield an extract which has a powerful vasoconstrictor action. Erythrocytes yield no vasoconstrictor substance. Leukocytes, as represented by the cells of the pleural exudate of the dog, yield none. Plasma can be obtained free of vasoconstrictor substance. Its constrictor action, when present, is probably due to changes occurring after it leaves the blood vessels. The circulating plasma of normal animals has probably no such vasoconstrictor action. The vasoconstrictor substance (or substances) is neither protein nor epinephrin. It is a crystalloid more readily extracted by water or alcohol than by ether or chloroform, and is probably not related to cholesterol. The vasoconstrictor substance, though present in coagulated blood, is not dependent on the actual formation of the blood clot, nor is it related to any of the factors concerned in coagulation, with the possible exception of thromboplastin.

22. **Platelet Count and Vasoconstriction.**—Fourteen experiments were performed by Hirose in which blood from twenty-eight patients was examined. These experiments were performed by bringing the defibrinated blood into contact with the surviving carotid of the ox suspended according to Meyer's method and registering its degree of constriction on a revolving drum by means of a magnifying lever. In these experiments bloods of about equal platelet counts produced approximately the same degree of vasoconstriction. With one exception, bloods of higher platelet count produced more marked constriction than bloods of much lower platelet count. This one exception was the blood from a case of polycythemia with a count of 314,000, compared with blood from a case of chronic nephritis with a count of 189,000. The difference in platelet content here is relatively slight. Of nine specimens of blood with a platelet count less than 100,000 only three produced any constriction of the artery when diluted with two volumes of Locke's solution, and only four when diluted with equal parts of Locke's solution. Two of these were from cases of pernicious anemia, one from a case of cirrhosis of the liver, and the fourth from a case of myeloid leukemia.

23. **Effect of Small Breakfast on Heat Production.**—Ten experiments were made by Soderstrom and his associates on five subjects to determine the extent of the rise in metabolism following a small meal. The standard breakfast used in all observations consisted of 30 gm. bread, 8 gm. butter, 10 gm. sugar, and 60 c.c. milk, amounting to 4.7 gm. protein, 9.0 gm. fat, and 28.9 gm. carbohydrate, or 222 calories. In the first hour following the ingestion of this the heat production increased on an average 7 per cent.; in the second hour, 2 per cent.; in the third hour, 2 per cent. In the sixth, seventh and eighth hours the metabolism was slightly lower than before the breakfast. It is evident that when this small

amount of food is taken for breakfast it is only during the first hour that the absorption of food could have been in sufficient quantity to produce the condition of a "metabolism of plethora."

25. **Metabolism in Malarial Fever.**—Seven observations were made by Barr and Du Bois on five patients when they were without fever. Four of these were in the intervals between the paroxysms; three after treatment. In all cases the methods of direct and indirect calorimetry were use. For the total series of experiments the calories, as measured by these two independent methods, agree within 0.08 per cent. of each other. The rectal temperature, which was measured every four minutes, showed typical malarial curves. Rectal temperature falls much more gradually than it rises. The surface temperature at first may continue to rise, then to fall gradually for a period, and later to fall at about the same rate as the rectal temperature. The heat production increases 100 to 200 per cent. during the chill; immediately after the chill it falls to within 20 to 38 per cent. of the average basal level; with the falling temperature the heat production drops to normal. During the period before the chill with constant temperature the heat elimination equals the heat production. During the chill, in spite of the enormous increase in heat production, the heat elimination is the same as in the preliminary period. Almost all of the extra heat produced is stored in the body tissues. In the fourth period of rising temperature after the chill there is a slight increase in heat elimination. In the fifth period of continuous temperature heat elimination begins to equal heat production. In the sixth period of falling temperature the heat elimination is greatly increased, chiefly by means of a large increase in the vaporization of water from the skin. Of the total calories produced in this period the patient loses a much larger percentage than normal through vaporization. On the other hand, the percentage of calories lost through vaporization is not greatly increased in its relationship to the total heat elimination. The respiratory quotients during the chill are higher than before or after the chill, suggesting the rapid combustion of glycogen stores during the violent muscular exercise of shivering.

26. **Ethylhydrocuprein in Treatment of Pneumonia.**—Moore and Chesney present the data accumulated in an extension of their former work and give the final results of two years' experience in the treatment of lobar pneumonia with ethylhydrocuprein. The experimental results obtained during the first year have been, for the most part, confirmed by the study of cases treated during the second year, and, in addition, some new facts have been ascertained. Of the forty-three patients treated with ethylhydrocuprein during the season 1916-1917, two received the base (optochin base) by mouth. Forty received the hydrochlorid by mouth and one patient received the hydrochlorid intramuscularly at first, and later by mouth. The serum of the two patients who received the base by mouth failed to show either bactericidal activity or power temporarily to inhibit the growth of pneumococci, although the amount of the drug given should have been sufficient to produce such a result if the base were as readily absorbable as the hydrochlorid. The authors suggest that the difficulty of absorption from the gastro-intestinal tract is undoubtedly dependent on the fact that the drug in this form is very slighly soluble. During treatment with ethylhydrocuprein pneumococci in the human body can gradually become "fast" or resistant to its action. The pericardial fluid obtained postmortem from patients treated with ethylhydrocuprein hydrochlorid showed pneumococcidal power. The serum of one patient who received a very large dose of ethylhydrocuprein hydrochlorid intramuscularly showed pneumococcidal power.

Among seventy-five patients treated with ethylhydrocuprein there were nine who showed some degree of amblyopia (12 per cent.); this was mild in three cases and more severe in six. In all those who recovered from the pneumonia, the eye symptoms disappeared completely after the administration of the drug had been discontinued. The systematic use of ethylhydrocuprein (optochin) in the treatment of seventy-five cases of acute lobar pneumonia due to pneumococci did not lead to any noteworthy therapeutic benefit. The authors suggest that the failure of the ethylhydrocuprein treatment to influence favorably the course of the disease is probably due to the following: (*a*) It is impossible to administer a sufficient amount of the drug to produce an effective concentration in the blood stream without at the same time exposing the patient to the danger of toxic action. (*b*) The rate of the pneumococcidal action of ethylhydrocuprein is too slow in the concentrations which may be attained in the blood stream of the patient with any degree of safety; pneumococci, therefore, may gain access to the circulating blood at a greater rate than they are destroyed therein, even though the serum show pneumococcidal action. (*c*) In the concentrations which are safely attained in the body fluids the drug probably penetrates but poorly into the alveolar exudate. The routine use of ethylhydrocuprein in the treatment of acute lobar pneumonia cannot be recommended.

27. **Circulation During Convalescence.**—The circulatory reactions of ten patients convalescing from acute infectious disease were studied objectively by Mann. The pulse reactions did not give any information of value. The blood pressure reactions, however, showed a progressive increase in the amount of work necessary to produce a "delayed summit."

28. **Mitochondria in Red Cells in Anemia.**—Increased formation in the number of mitochondria containing red cells was produced experimentally by Sappington by the removal of blood or by the injection of phenylhydrazin hydrochlorid. The degree of this increase was in the individual case roughly proportional, and on the average exactly proportional, to the need for red cells as measured by the degree of anemia produced. These experiments, therefore, support the suggestion that the number of red cells containing mitochondria may prove to be a useful indication of the rate of red blood cell formation in clinical and experimental conditions.

44 *Pharmacologic and Therapeutic Study of Benzyl Alcohol as Local Anesthetic. D. I. Macht, Baltimore.—p. 263.

38. **Circulation in Man in Head Down Position.**—The author's object was to determine whether in the normal man an increase of the venous pressure and the venous supply to the heart can be produced by means of the inverted positions and if so whether they will increase the diastolic filling and

the systolic discharge of the ventricles, and the volume of the blood in circulation. In the inverted or head down position (30 to 45 degrees) the heart rate in ten men was slower than in the flat position by an average of 9.5 beats a minute (maximum 23, minimum 4.5), and slower than in the erect position of 17 (maximum 34, minimum 10). The diastolic distending force of venous pressure was increased but arterial pulse pressure was not augmented. This fact the authors interpret in support of the view that normally in the erect position the distending force of venous pressure is above the critical value, and the heart works therefore at maximum efficiency for the rate of beat. No third heart sound was audible in the inverted position. The necessity of recognizing some sort of venopressor mechanism regulating the venous return to the heart is pointed out. A method estimating the efficiency of the venous return is described. By this method it is found that a very distinct decrease in the volume of the venous return is generally induced in man by anesthesia and operation, and occurs also in acute disease.

39. **Influence of Forced Breathing on Circulation.**—The results obtained on six healthy men who had had some practice in the performance of voluntarily forced breathing were very clear and decisive. 1. Venous pressure in the inverted position after forced breathing underwent in every case a very marked and strikingly long continued fall, amounting to 8 to 11 c.mm. blood. Recovery did not occur in any case until many minutes after apnea had terminated. 2. The arterial pressures, systolic, diastolic and pulse, were not greatly affected. 3. The tachycardia which forced breathing usually induces was suppressed by the inverted position. 4. Evidently the disturbance of the circulation induced in man by acapnia consists chiefly and fundamentally in a decrease of the venous return to the heart. The evidence seems to be well rounded out that this type of circulatory depression is a very common occurrence under anesthesia and operation and in some other conditions.

40. **Standardization of Pituitary Extract.**—This test consists of a study of the action of the drug on the melanophores of Fundulus which, Spaeth says, must be considered functionally modified smooth muscle cells, thus opening a new approach to various pharmacologic problems, including that of biologic drug standardization.

41. **Effect of Lactic Acid on Respiratory Center.**—In a series of forty-four determinations on ten dogs, Cohen noted that intravenous injections of 0.5 c.c. of normal lactic acid per body kilogram weight produce a marked increase in respiration, both in amplitude and in rate. The action was almost immediate, with a latent period of fifteen to thirty seconds and with a duration of two to four minutes. This response is not specific for lactic acid, but may be produced by practically any organic or inorganic acid. Cohn suggests that the mechanism of this hyperpnea probably involves three factors: (*a*) the acid may liberate carbon dioxid from the blood carbonates, and the excess carbon dioxid may play some part in the excessive movement; (*b*) the acid may act as a direct respiratory stimulant; (*c*) probably the most important factor, the acid sensitizes the respiratory center. The reaction is most probably due to a synergistic action of the acid and carbon dioxid on the respiratory center.

42. **Cutaneous Irritation by Mustard Oil as Influenced by Various Solvents.**—Sollmann says that olive oil and other good solvents for mustard oil hinder its penetration into the skin. The greatest irritation is obtained by watery suspensions, for instance, in mucilage. Olive oil and turpentine produce practically no hyperemia; ether and absolute alcohol produce very little hyperemia; 95 per cent. alcohol causes a distinct hyperemia, whereas 50 per cent. alcohol causes marked and lasting hyperemia; mucilage of acacia and simple syrup cause the most intense and persistent hyperemia.

43. **Composition of Oil of Chenopodium.**—The experiments made by Hall and Hamilton appear to warrant the conclusion that oil of chenopodium as ordinarily marketed is a very potent and valuable anthelmintic, but that it not infrequently acts as a gastro-intestinal irritant, a fact that seems to have been commonly overlooked, disregarded or allowed to go unstated. The gastro-intestinal irritation seems to be due to constituents making up a fourth, or less, of the volume of the oil. The use of the lighter fraction as an anthelmintic in preference to the entire oil, in order to protect the patient from gastro-intestinal irritation, is apparently indicated.

44. **Pharmacologic Study of Benzyl Alcohol.**—Experimental data and clinical cases show that benzyl alcohol is an effcient local anesthetic when administered in aqueous solution. This alcohol is soluble up to 4 per cent. in water in physiologic saline. These concentrations appear to be entirely efficient for practical purposes. The interesting features in connection with this drug which should be especially emphasized are in the first place its low toxicity as compared with that of the commonly employed local anesthetic alkaloids of which cocain is the standard representative. The next interesting and important feature in connection with benzyl alcohol as an anesthetic is the ability of the organism to metabolize it and excrete it in an innocuous form. Third, an important feature of this local anesthetic is its high boiling point and the consequent ease of sterilization. Last, the comparatively low price of the drug and its ease of production.

88. Abstracted in The Journal, June 9, 1917, p. 1779.

91. **Urine in Diabetes Mellitus.**—The total number of cases studied by Richards is fourteen. The total number of urine examinations is ninety-one. The diet in this series of cases was the von Noorden test diet or, in a few cases a mixed diet such as is known as "regular diet" in Bellevue Hospital. Twenty-eight observations showed urinary acetone bodies with high ammonia and normal rest nitrogen. Four observations showed urinary acetone bodies with normal ammonia and high rest nitrogen. Fourteen observations showed urinary acetone bodies with high ammonia and high rest nitrogen. Eight observations showed no urinary acetone bodies with high ammonia and normal rest nitrogen. Two observations showed no urinary acetone bodies with high ammonia and high rest nitrogen. Fifteen observations showed no urinary acetone bodies with normal ammonia and high rest nitrogen. Eight observations showed urinary acetone bodies with normal ammonia and normal rest nitrogen. Twelve observations showed no urinary acetone bodies with normal ammonia and normal rest nitrogen. Hence it is apparent that there may be an increased excretion of ammonia in the absence of urinary acetone bodies; and there may be a normal excretion of ammonia with urinary acetone bodies. The quantity of sugar excretion has no relation to the ratio of the nitrogen content of urine. In many cases of diabetes there is a disturbance of the ratio of the nitrogen content of the urine which may be corrected by regulating the nitrogen intake, but no correction of the urinary sugar nor of the urinary acetone bodies will correct this nitrogen disturbance.

103. **Usefulness of Blood Chemical Methods in Diagnosis of Cardiac and Renal Disease.**—After a rather extended experience with the blood chemical findings in both primary cardiac and renal conditions in their earlier manifestations, and after having been able to check the clinical diagnosis by the so-called retention tests, Gradwohl and Powell tried out these methods in actual practice in a class of severe cases. The blood was taken in the morning before breakfast whenever possible, received into oxalate of potassium, defibrinated, and examinations were made at once. The following methods were used: Marshall for urea nitrogen; Folin modified by Benedict for uric acid; Folin for creatinin, and the Benedict and Lewis for sugar. The necropsy records, when obtainable, corroborated in each instance the blood chemical findings on which the differential diagnosis was made. In the cardiac cases there was practically no increase in the nonproteid nitrogenous constituents, though the urine in each case showed albumin and casts. The renal cases all showed a marked increase in these blood constituents, particularly in respect to one case which had 108 mg. urea nitrogen, 9.8 uric acid, 4.48 creatinin, and 0.148 per cent. sugar. All of the cases showed marked increase in uric acid. The urine showed albumin and casts, just as it did in the cardiac cases By these tabulated figures alone the authors are able to differentiate with exactitude the difference between the cardiac case and that primarily renal. In other words, laboratory data in this mixed group of cases were sufficient to point the way to the correct diagnosis, and the institution of the proper treatment.

20. **Destruction of Nits of Clothes Louse.**—Bacot and Lloyd found that the compound solution of cresol (crude phenol and soft soap emulsion) solutions are decidedly more effective than the cresol soap emulsion solution at the higher temperature but less so at 32 F. The difference in the latter case is not great, and may possibly be largely, if not entirely, a matter of chance, dependent on uncertainty of action at low temperatures. An interesting feature of the series is the regular rise in the percentage of lice which die while hatching as the action of the solutions become less fatal up to a midpoint, when it again declines to a minimum in proportion as the hatching ceases to be checked owing to the weakness of the solutions. It is a matter of question whether death during escape from the egg is due to the action of the fluids on the eggshell, or to a want of robustness in the larvae. The evidence as a whole seems to establish the fact that steeping for twenty minutes in a 2 per cent. solution, either compound solution of cresol or the cresol soap, is quite effective provided the temperature is not below 50 F.

24. **Prognosis in War Nephritis.**—With the aid of the Medical Research Committee the subsequent history has been investigated by Abercrombie in an unselected series of 171 cases of war nephritis. During their initial stage the cases had been under his care in a base hospital in France, to which they were admitted between April, 1915, and February, 1916, inclusive. Their after-histories have been traced until November, 1917—that is, for periods varying from twenty-one to thirty-two months. Their initial stage was an acute illness, exhibiting albuminuria with edema. Six deaths occurred. Thirty-two men were invalided as permanently unfit on account of nephritis, thirty-one were discharged to some form of duty. Of these 131 cases, twenty-two subsequently either relapsed or showed chronic renal symptoms, and were ultimately invalided for nephritis; the remaining 109 showed no further history of the disease.

30 *Case of Partial Hereditary Anonychia. F. Charteris.—p. 207.

30. **Partial Hereditary Anonychia.**—Charteris' patient was a man, aged 34 years, who was admitted to the infirmary suffering from trench fever. It was noted that the nails of the thumbs, forefingers and second fingers of both hands were entirely absent, and those of the ring fingers only developed as regards the ulnar half. The little fingers had complete normal nails. A similar condition was present in the toes, the three inner toes lacked nails, the fourth toe had a rudimentary nail, while the little toe was furnished with a normal nail. While the fingers show absolutely no indication of any attempt at nail formation, in the toes there are distinct grooves indicating the nail beds. In the fingers the area normally covered by the nails showed concentric markings, similar to the markings normally present on the palmar aspects of the terminal phalanx. The congenital absence of the nails was a hereditary defect in the patient's family. It could be traced back to his great grandmother; and of his own four children, two show the exactly similar abnormality, while the other two have normal nails. In the preceding generation only this patient showed the family defects, his brothers and sisters having normal nails. The absence of the nails seems to cause little or no inconvenience. Previous to joining the army the patient had been a miner.

35. **Agglutination Method of Diagnosis.**—A large experience of the agglutination test in enteric fevers has made it evident to Perry that the method must be accorded a very prominent position in the laboratory diagnosis of this group of diseases. This is more especially the case since the introduction of preventive inoculation with the triple vaccine. as the isolation of the infecting organism from the blood, feces and urine has become more difficult. An attempt at making a diagnosis on agglutination results by any method other than a repeated and accurate titration of the agglutinin content of the serum, Perry says, does not appear feasible, and the use of standardized agglutinable cultures in this connection is obvious. Regarding the value of the test in all cases, Perry's opinion may be summarized as follows: 1. Positive results: Presuming that the technic is carried out by a skilled and careful worker, a change in titer of 100 or 200 per cent., manifesting itself in a regular curve and reaching its maximum between the sixteenth to the twenty-fourth day (in exceptional cases as late as the thirtieth day) justifies a diagnosis of active enteric infection. 2. Negative results: Cases which are clinically classified as belonging to the enteric group at present occur in which not only do repeated bacteriologic examinations fail to isolate an organism, but in which agglutination readings are so absolutely level or exhibit such slight variation that they afford no help in confirming the clinical diagnosis. Presuming that such are true cases of enteric infection, the failure to confirm the clinical opinion by agglutination findings may be due to one of the following causes: (*a*) Possibly, but not necessarily as a result of inoculation, the character of the infection may be so mild that agglutinins are produced to such slight extent as to cause a variation in titer which is not diagnostic. (*b*) The organism responsible for the infection may be a feeble producer of agglutinins. This particularly applies to paratyphoid A infections. (*c*) The fact that many of these cases have, in addition to receiving a typhoid vaccine, also been inoculated with 4 doses of T. A. B. (typhoid paratyphoid A paratyphoid B) vaccine, may in some way influence agglutinin production.

36. **Septic Phlebitis Due to Gunshot Wounds.**—In connection with the frequency of septic phlebitis consequent on gunshot wounds, Burrows says, one cannot help being struck by the large percentage of cases in which evidence of bronchopneumonia or pleurisy is found postmortem. Among 100 consecutive cases were 25 in which death had followed gunshot wounds of the limbs. Among 24 cases of leg wounds, 10 (41.6 per cent.) had phlebitis, 9 (37.5 per cent.) had bronchopneumonia. Pulmonary infarcts were found in four of the cases in which phlebitis was not observed, although the presence of the infarcts indicates that it was present. This observation bears out the main theme of this paper, that septic infection of veins is, so far as the base hospitals in France are concerned, the chief cause of mortality after gunshot wounds of the extremities. The proper treatment consists in tying the vein at some point above the level of the clot, dividing it below the ligature, and either removing a length of the vein with its infected contents or, if this be not possible, opening the vein freely to afford drainage. Spontaneous recovery may take place, especially if small veins alone are involved.

37. **Cerebrospinal Fever.**—In all but six of the 92 cases analyzed by Attlee was the meningococcus seen in the cerebrospinal fluid and in most cases it was cultivated. In these six the cerebrospinal fluid was turbid and contained many polymorphonuclear leukocytes, and one of the patients died with the usual postmortem appearances in the meninges of cerebrospinal fever. Three of the six were in the Lister series and three in the Pasteur. Thirty-three patients were treated with Lister serum. Of this number 18 recovered and 15 died. Of the recoveries two were completely deaf when evacuated and one was completely deaf in one ear. In none of the others was there any sign of permanent disability. Fifty-two patients were treated with Pasteur serum. Of this number 33 recovered and 19 died. None who recovered had any sign of permanent disability. Seven patients were treated with Lister and Pasteur serums combined. Of this number 3 recovered and 4 died. Of these patients, 4 began with Lister and were given Pasteur afterward, rather as a forlorn hope, and all died, the other 3 began with Pasteur and afterward had Lister owing to a temporary shortage of supply, and all recovered. Of the 54 patients who recovered, 21 were unconscious or delirious on admission and 33 sensible. Of the 38 who died, 23 were unconscious or delirious and 15 sensible. In every case the neck was definitely stiff, and in every patient who was not comatose or moribund on admission Kernig's sign was present at some time or other in the course of the illness. Twelve had rashes, 6 of these recovering and 6 dying. Twenty-two had one or more cranial nerves affected, strabismus being definitely noted in 18. Nystagmus has been quite common. Serum arthritis has been common, most often of the wrists and knees, once of the temporomaxillary joints. It has never needed any active surgical treatment. Urticarial and erythematous rashes have been frequently noted. Two had orchitis during convalescence. One had cyclitis beginning some time before admission on the fifth day of the disease. Only one symptom has been at all constant—headache, generally acute and of sudden onset. Only one sign has been of real help in diagnosis—stiffness of the neck. The greatest number of punctures in any one of the recoveries was 26, of those who died 25. The greatest total amount of fluid drawn off among the recoveries was 1,909 c.c., among those who died 2,127 c.c. The average amount of fluid per puncture in a recovery was 61 c.c., and in those who died, 54 c.c. The average total quantity of serum given each man who recovered was 180 c.c.

45. **Acriflavine and Proflavine.**—An investigation was undertaken by Carslaw and Templeton with the object of ascertaining whether the action of proflavine differed in any way from that of acriflavine. Since October, 1917, a large proportion of the infected gunshot wounds admitted to one hospital have been treated with acriflavine, and the clinica results have been observed in over sixty cases. Proflavine followed by eusol, was used in thirty cases (thirty-two wounds being treated). In all cases 1:2,000 solution in normal saline was used. The rapid improvement in the general condition of patients as shown by subsidence o temperature, pulse rate, etc., and rapid disappearance o pain and of inflammatory edema in the vicinity of wound were very evident. Although the action of acriflavine and proflavine is very similar there can be no doubt that proflavine is slower. The improvement in the general condition of patients is not so rapid. The formation of the fibrinous membrane is not usually complete until the fifth, sixth, or seventh day in contrast with its presence on the third, fourth or fifth day when acriflavine is used. Further, separation of membrane and attainment of a "clean" wound are also slightly delayed. The application of flavine to infected wounds does not render them bacteriologically sterile. Flavine is clearly antiseptic, not disinfectant, in action. There is a complete absence of evidence of damage to tissues when these salts are used in solution not stronger than 1:1,000. There is no necrosis of any of the exposed tissues. These salts are of undoubted value in controlling and preventing the spread of sepsis, as is shown by the rapid improvement in local and general conditions. This object having been gained, there is no advantage in continuing their use, as a condition is reached in which reparative changes are slow, although not by any means absent. Following on the substitution, after a few days, of a more stimulating antiseptic, for instance, eusol, a "clean" wound is obtained sooner than by any other form of treatment known to the authors. There is no evidence of any general toxic effect.

46. **Brilliant Green and Gunshot Wounds.**—Of a large number of cases treated with brilliant green information regarding their subsequent progress was obtained in only forty-six cases. The wounds had, without exception, been received from two to eight hours previous to treatment, and were all severe, with considerable tissue damage. No specia type of case was selected, but it was not used in case involving the peritoneal or pleural cavities, though there seems to be no reason why it should not be so used. Th

solutions used were: (1) 1:1,000 brilliant green in normal saline; (2) 1:500 in normal saline; (3) 1:500 in 0.5 per cent. chloretone. Of the solutions No. 3 was preferred. It appeared to have a definitely analgesic effect, rendering dressing less painful. Wounds appeared to clean more quickly under the stronger solutions. No toxic symptoms were observed in any case. Results were recorded by independent observers and reported, for the most part, by means of Form M. R. C. 1, since it was necessary to evacuate early. When possible a complete excision of damaged tissue was carried out and foreign bodies were removed. In cases of compound fracture all fragments of bone having no periosteal attachment were removed. Damaged tissue is more deeply stained by brilliant green than is healthy tissue. It is useful in this respect when excising the tracks of missiles. All tissue, except skin, which holds the stain of 1:500 solution, should be excised. Brilliant green produces exuberant, but very vascular, bright red granulation. Noticeable features in cases treated with it are the absence of edema and inflammation round the wound and the rapidity with which sloughs and sequestra separate. It is painless in application and does not appear to interfere with the growth of epithelium. For these reasons it may be considered a useful antiseptic, and though it can by no means atone for an incomplete or faulty primary excision it may be used with advantage where anatomic conditions render complete primary excision impossible.

65 Acute Nephritis from Mercury. S. Livierato.—p. 229.

57. **Cancer of Lung.**—In Galliard's case the emaciation was explained by the roentgen rays as due to an extensive primary cancer in the lung. There was also partial pneumothorax. Netter has had a case in which the diagnosis was made from small cancerous masses in the sputum. An operation was done for purulent pleurisy and the man survived for a year, confirming the slow evolution of cancers of the lung.

59. **Malarial Hemiplegia.**—Léri reports five cases of hemiplegia developing early in malaria or several years after infection. The hemiplegia was slight and incomplete, and three of the five patients had aortitis. In the other two the hemiplegia had developed slowly and insidiously. The symptoms indicated that the gray matter had been touched. This hemiplegia and the aortitis should be sought for as the fitness for service is impaired by them.

60. **Rachitis in Soldiers.**—Léri and Beck state that in the last few months they have encountered no less than thirty *petits rachitiques* among the men in their service. They describe the various manifestations of this "minor rachitis" which is liable to be overlooked in examining men for the service. Most of such men have outgrown their disturbances from their rachitis, but some still feel the effects, and most of those they have seen had been sent for treatment on account of persisting pains. These pains were never violent, but the dull ache along segments of the limbs hindered or rendered impossible any long march or heavy work. Their whole attitude of body and mind is that of asthenia. Physically and mentally hypotrophic during childhood, they have never thrown this off completely. One man simply refused to get up, saying his bones ached, but no signs of sickness could be found. He did not seem to realize the gravity of his refusal; the idea of the guard-house did not occur to him. His only preoccupation was to be left in repose. These *petits rachitiques* must be regarded as fit for light duty only; they should be transferred to the auxiliary service.

73 Actinomycosis and Botryomycosis in Morocco. M. Tussau.—p. 241

67. **Primary Suture of War Wounds.**—Lemaitre reviews the experience of twenty-nine months of primary suture in 2,537 cases of war wounds in the various surgical units of the Ve Armée. He insists that there is no need to cut out more of the tissues in preparation for primary suture than with any other method. What is necessary is to get rid of all devitalized tissues and no more. Curved scissors are far superior to the bistoury, cutting not from the point but at a tangent from their convexity, thus avoiding the reflex contraction of fibrils before the advance of a bistoury. Muscle tissue does not regenerate and hence, he says, it should be economically excised, and never cut across unless absolutely necessary, as otherwise this severs, along with the muscle, the nerve and vessels. The hemostasis must be perfect, not only to prevent hematoma at any price, but to ensure the fixation of the germs under the action of the tincture of iodin. The wound is dried with gauze, tamponing it. As this is rapidly removed, the tissues are swabbed freely with tincture of iodin. Any excess is wiped up with another gauze sponge. When the drying has been properly done, the tissues look as if varnished. The iodin is not needed for small wounds with healthy tissues which do not require excision; and it is not required when the devitalized tissues are removed *en bloc*. He uses a 5 per cent. tincture of iodin in all his work, but would prefer some fluid for the fixation with which there was no fixation of the superficial cells of the wound. This entails a slight oozing, along the filiform drains, of a yellowish serous fluid, evident by the third or fourth day. It retards the healing of the wound by four or five days so that the threads cannot be safely removed until the twelfth or thirteenth day. On the other hand, it offers the advantages that the delayed primary suture can be postponed till the eighth or ninth day or even to the tenth or twelfth. With this iodin fixation we render harmless the germs that have been sown on the surface of the wounds during the operation. This put an end to suppuration in his service.

The only absolute contraindications to a primary suture are infection too far advanced for primary reunion, and so much disturbance in the circulation of blood and oxygen, general or local, as to favor the proliferation of anaerobes in case of suture. In his last series of 1,891 wounds, primary suture was applied in 79 per cent. and in his total cases the method proved successful in all but 0.84 per cent. Only four deaths occurred later, three from injury of the brain and one of the thorax. In the complete failures the streptococcus was always found and usually in those requiring the cutting of one or two stitches. He therefore accepts Tissier's dictum that the streptococcus is responsible for the failures, other things being equal, but the insignificant number of his failures proves that the primary infection with the streptococcus does not inevitably doom the suture to failure. He relies on the clinical findings alone in deciding whether to open up again the sutured wound.

68. **War Wounds of the Bladder.**—Cathelin reports a series of twenty-nine war wounds of the bladder. Such injuries are grave but surgery and the retention catheter generally bring the men through. All his patients recovered except three, two succumbing to their extensive wounds and one dying later from tetanus. Immediate suprapubic cystostomy is necessary when the wound has involved the peritoneum or rectum or both, and when the anterior wall has been perforated. With a wound in the lower part of the bladder, draining perfectly, there is no need for immediate cystostomy unless fever and retention call for it. Under other conditions he prefers cystotomy; he deprecates further any attempt to suture the bladder wall at once unless the wound is intraperitoneal. He emphasizes the importance of having the men empty their bladders before making an assault and during heavy firing. The empty bladder is comparatively well protected by bones.

69. **Surgical Repair of Posterior Urethra.**—Rochet has successfully applied in four more cases of war wounds of the deeper urethra his method of mobilizing the prostate and bladder end of the urethra, and bringing it out by detaching the median perineal aponeurosis from its attachment to the ischium and pubis.

70. **Transfusion of Venous Blood.**—Murard gives an illustrated description of the technic for transfusion of citrated blood with the details of sixty cases, including several from his personal experience.

71. **Saline Infusion with Gum Acacia in Treatment of Shock.**—Delaunay has been using for some time Locke's solution plus 3 per cent. gum acacia in treatment of low blood pressure from hemorrhage and shock. He relates here confirmatory experiences on two rabbits and in three clinical cases. If the vasomotor nervous system has entirely collapsed, nothing seems to do any good, even although the loss of blood may have been comparatively insignificant. The gum acacia seems to act like the lacking proteins in the blood, raising and maintaining the blood pressure by its viscosity and osmotic pressure. But if there has been great loss of blood, it is necessary to precede the Locke by an infusion of physiologic saline or sugar solution to give the heart fluid to pump on, as the mucilaginous Locke solution is not administered in an amount over 150 c.c.

Presse Médicale, Paris

74 *Elimination by the Kidneys. L. Ambard.—p. 217.
75 *Sensitized Autovaccines. L. Bazy and L. Cuvillier.—p. 219.
76 *Treatment of Scars on the Face. A. Poulard.—p. 221.

74. **Elimination by the Kidneys in Health and Disease.**—Ambard defines elimination by the kidneys as (1) elimination by effraction, as when a capillary vessel in the parenchyma ruptures; (2) elimination by diffusion, the kidney behaving like an inert membrane to certain substances, eliminating them by diffusion—the proportion in the urine being never higher than in the blood, and (3) elimination by secretion. The latter is of course the most important type of elimination, and it is a process governed by the laws of the secretory constants. (These laws were well explained by McLean in The Journal, Feb. 5, 1916, p. 415.) The most characteristic feature of secretion is concentration, that is, the presence of a substance in the secretion in larger amounts than in the blood from which the substance was taken. Certain substances in the blood have a threshold, while those not needed for the vital processes of the cells, such as urea, ammonia, iodin, salicylic acid and methylene blue have no threshold. Glucose and sodium chlorid, being substances needed by the cells, have a threshold, and the element acting on the kidney is the excess of the substance above its threshold. With a chlorid content in the blood of 6 per thousand, we need consider only as affecting the kidneys, the excess of 0.20 per thousand above the threshold, if it happens to be 5.80 per thousand. [illegible] obinuria, the hemoglobin content of the urine is often much higher than in the blood, testifying to the fact that the secretion, and hence the hemoglobinuria, has to be studied as a secretion. Chabanier's recent research has established that the secretory constant for substances without a threshold is the same for each substance in the same person. For example, if the secretory constant for urea is 0.09 it will also be 0.09 for iodin, methylene blue and the other substances without a threshold. The substances in this group seem to be all solvents of fats, and they all share the same secretory constant for a given person. Hence functional tests of the kidneys with any of these substances will always elicit the identical response, and they can be used interchangeably for the functional tests.

On the other hand, the secretory constant of substances with a threshold is identical with those of substances without a threshold. The thresholds are higher and lower at different times, and this movement of the threshold can be studied with phlorizin, which lowers the threshold of glucose, as is evident by the ensuing glycosuria, and with theobromin, which lowers the threshold of chlorids, and the diuresis of chlorids increases in consequence. The matter of the threshold is thus a very important one in investigation of kidney functioning. The constants may be satisfactory, but if the threshold for chlorids is high, the man will excrete very little chlorids while he will excrete practically all his iodin.

In determining the urea content of the blood, the xanthydrol technic is accurate but it requires such precision in scales, etc., that it is not practicable outside of a laboratory. The hypobromite technic is inexact, but the errors in the blood findings and in the urine balance each other, so that the outcome is dependable if as much as 25 or 30 c.c. of blood is taken for the test, and if the fluids in the ureometer are thoroughly blended. A rubber cot on the finger plugging the tube renders much more convenient this thorough stirring up which has to be done ten or twelve times in the course of fifteen minutes to complete the chemical reaction. The day of the test nothing but a small cup of coffee or tea and one small slice of bread should be taken for breakfast, and the urine for the test tube should be taken between 9 and noon. The bladder should be emptied completely and then again after an interval of an hour or hour and a half if the urine is drawn with a catheter; if not, after two hours.

Among the practical deductions from the ureosecretory constant is that the identity of the secretory constant may afford indications for administration of certain drugs. For example, if the constant with iodin proves to be 0.21, then we know that this person will retain in his blood three times as much iodin as normal. The varying constant may show wide variations in the quantity of sugar excreted in the urine in the glycosuria of diabetes.

Another practical point is the close correlation between the constant and the maximal concentrations. Good concentrating power goes with a good constant. Legueu regards the light thus thrown on the maximal concentration as the most instructive feature of the secretory constants. With a poor concentrating capacity, the slightest oliguria may entail such retention of nitrogen as to prove fatal in a few days. Another practical deduction from the ureosecretory constant is in respect to the evolution of uremia-inducing nephritis. With azotemia of less than 0.50 gm., the deficit in functioning kidney tissue may range from 0 to 80 per cent.; with azotemia of 0.50 to 1 gm., the functional deficit is between 40 and 90 per cent.; with azotemia of from 1 to 2 gm., the deficit is from 80 to 98 per cent. and it is useless in this case to waste time on determining the ureosecretory constant, as prolonged azotemia of 2 gm. dooms the subject to a more or less speedy death. The ureosecretory constant is thus most instructive with azotemia between 0.60 and 0.70, and these form the great majority of cases of nephritis; at this stage the disease is still more or less curable.

75. **Sensitized Autovaccines.**—Bazy and Cuvillier combine the advantages of serotherapy with those of vaccine therapy by sensitizing the vaccine with a polyvalent serum. The immunity conferred develops early, as with typical serotherapy, while it is durable, as with typical vaccine therapy. Their method is to add an emulsion of forty-eight hours'

cultures on gelose to the tube containing the polyvalent prepared serum. The tube is incubated at 37 C. The microbes float on top of the serum until they become agglutinated, when the clumps drop down through the serum and finally lie on the bottom of the tube in a compact mass. The physiologic solution used for the emulsion then clears up and becomes limpid. The fluid is then decanted and the clot of microbes is rinsed carefully to remove all excess of the polyvalent serum. The small viscid mass formed by the microbes thus sensitized by the serum is emulsified in a little physiologic solution so that the emulsion looks like a twenty-four hours' bouillon culture of typhoid bacilli. This opalescent appearance corresponds to about sixty or eighty millions microbes per cubic centimeter. The vaccine is heated three times for an hour to 56 C. The dose is 1 c.c., injected subcutaneously in the thigh, usually repeated at intervals of five days up to three, four or five inoculations. These sensitized vaccines seem to be borne admirably well. Their action has been certain, rapid, harmless and durable. Among the typical cases related to show the efficacy of these sensitized autovaccines is the case of a nurse who had had eighty-three furuncles in the course of four months rebellious to all other measures. After the first injection of the vaccine three large furuncles faded away in less than two days and others starting were aborted. Great improvement in the much depressed general health followed the second inoculation, and the furunculosis subsided completely. Six inoculations were given in this case in the course of three weeks The microbes in this case were a staphylococcus and a pseudodiphtheria bacillus which has been found so common in war wounds that it is used in producing the polyvalent serum Three months to a day after the last injection, two furuncles made their appearance, suggesting that this is the limit of the immunity. As there was some of her autovaccine still on hand, four injections were made, and the recurring furunculosis was aborted. Their success suggests a possible new era for serotherapy made without the heterogenous albumins of horse serum as the carriers of the antibodies.

76. **Treatment of Scars on the Face.**—Poulard makes a deep elliptical incision around the disfiguring scar and then strips off the epidermis over the scar but otherwise does not molest it. The skin is then mobilized around and drawn together across the scar tissue. It is then sutured in a straight line, leaving merely a linear scar. There is no depression or sagging as the cicatricial tissue below acts as a support, while there is no chance for rousing old infection as when the scar tissue is excised.

79 *Projectiles in Neck and Head. M. Patel and M. Arcelin.—p. 640.
80 *Laws of Healing of Wounds in the Skin. A. Lumière.—p. 656.
81 *War Wounds of the Spleen. J. Fiolle.—p. 679.

77. **Fate of Projectiles Left in the Mediastinum.**—This instalment of Le Fort's article fills 117 pages. It is based on thirty-seven cases of foreign bodies in the mediastinum, with healed point of entry, thirty cases of operations on regions contiguous to the mediastinum, and on a number of operations on the mediastinum for reasons other than the presence of a projectile. Most of the wounded with a projectile left in the tissues experience annoying symptoms from its presence, mostly dyspnea on effort, which debars them from work. By observing a number of minor points, which he describes, the foreign bodies can be sought and removed with ease and without harm. No operation on the mediastinum should be considered without roentgen study of the case with all the mechanical aids possible. The access to the mediastinum should be large and ample, and as direct as possible, with integral repair of the wound.

78. **Functional Value of Stumps.**—Amar is director of the physiology of work of the National Conservatory of Arts and Trades, and he emphasizes that the physiologist should be called on to work with the surgeon and the orthopedist, as the aim after an amputation is not so much to restore anatomic conditions as to restore a partially or totally abolished function. The prosthesis should realize the movement with the minimum of fatigue, and the modern methods of physiologic experimentation permit exact valuation of this. The functional capacity of the stump can be thus estimated and classified. We thus appreciate that there are twenty-two different types of mutilations, and the compensating forces aid in restoration of function. The uncompensated functional incapacity is the base on which the pension for disability should be calculated, and the physiologic tests will reveal and evaluate it. They will also reveal the defects of the artificial limb: lack of proper proportions and principles in the making of prosthesis, hence inertia and fatigue; lack of stability and solid anatomic, plastic fitting of the prothesis, hence awkward use and a feeling of insecurity. Most prostheses break at the end of the stump or near the joints. The whole question of artificial limbs needs to be gone over again, working out the chart for each wounded man by the physiologic tests, analyzing the movements by means of moving pictures to calculate the minimal weight of the segments of the artificial limb, the angles of flexion, and the physiologic center of the joint. He has devised dynamographic apparatus for testing the stump of arm and leg, and gives an illustrated description of their application and analysis of the findings.

79. **Prevertebral Projectiles.**—Patel and Arcelin describe the important lessons learned from their experience in extracting projectiles in front of the spine in neck and head in six cases They had only one mishap; the multiple adhesions in this case led to injury of the internal jugular vein in trying to detach the vessel. The hemorrhage was arrested at once by tamponing the lateral sinus. All the patients healed by primary intention.

80. **The Laws of the Healing of Wounds.**—Lumière's experimental and clinical research has apparently demonstrated that large noninfected skin wounds heal according to certain mathematical laws. The healing proceeds at the same rate at the end as at the beginning. The time required is proportional to the size of the area that is to be healed. These laws and the rate of repair seem to apply indiscriminately to different animals of the same species of about the same age and state of health. By heeding these laws we get a standard for comparison of the effects of different methods of treatment, different antiseptics, dressings, etc.

81. **War Wounds of the Spleen.**—Fiolle remarks that the proper treatment of war wounds of the spleen is still open to question. He has found records of forty-four cases, and comments on the usual lack of symptoms at first, or there may be symptoms suggesting peritonitis from perforation. There may be nothing to suggest internal hemorrhage at first, strange to say. It does not become apparent until a few hours or days later, and then usually proves fatal. The hemorrhage occurs early but no symptoms develop from it for a long time. He knows of only one case of spontaneous healing of a bullet wound in the spleen. When symptoms become manifest, then conditions are so grave they generally prove fatal, with a peculiarly rapid and malignant course. Splenectomy is the preferable treatment; five recovered of the seven men treated with splenectomy, and other causes were responsible for the two fatalities. An illustrated discussion of the best mode of access is supplemented by the details of the forty-four cases mentioned.

82 *Divulsion in Treatment of Fistula. B. Masci.—p. 389.
83 *Cystic Point as Sign of Typhoid. G. Genoese.—p. 391.
84 Rhabditis Pellio in Nephritis Urine. M. C. Francaviglia.—p. 394.
85 Freaks of Projectiles. E. Bussa-Lay.—p. 397.

82. **Divulsion in Treatment of Anal Fistula.**—Masci dilated the anus in treatment of fissures and found that this cured not only the fissures but also coexistent anal fistula in his three cases of this kind. The fistula is maintained by the septic environment, the movements to which it is subjected, and the inability of voiding its contents. Divulsion of the anus does away with all three of these factors. He gave first

a purge, then cleansed the region thoroughly, and the divulsion of the anal sphincter with the fingers was followed by introduction of a large tube wrapped in gauze. Opium was given for five days to leave the anus at rest. Then an oil purge was given, and then opium for three days. By the tenth day clinically normal conditions had been restored. Of course tuberculous fistulas would not be amenable to this treatment, nor when there are complications or extensive destructive lesions, but the cure was prompt and complete in his three cases, including one in which the fistula had developed in a suppurating hemorrhoid. They were all in the sphincter and involved the mucosa and the subcutaneous tissue.

83. **The Painful Cystic Point in Typhoid in Children.**—Genoese found the cystic point painful in all his 30 typhoid cases in children while no pain could be elicited at this point in 24 cases of lobar pneumonia, 40 of bronchopneumonia, 18 of measles, 6 of malaria, 16 each of tuberculous meningitis and peritonitis, 27 of gastroenteritis, 32 of rachitis and 18 of acute articular rheumatism. The pain at the cystic duct was found during the first week of the typhoid in 18, and in the others from the eighth to the eleventh day. The painfulness was not proportional to the gravity of the typhoid, and it gradually subsided as the disease approached convalescence, but kept high to the end in the fatal cases. The liver was enlarged in all and the spleen was palpable. The infection of the liver and bile passages does not seem to be due to ascending infection but to the elimination through the vessels in the liver of the microbes contained in the blood. The liver and the biliary passages hypertrophy under the strain of this task of destroying the toxins and bacteria brought to the liver in the blood. There is probably slight cholecystitis, and this explains the lively pain on pressure of the cystic duct. He gave hexamethylenamin to ten of the children; it did not seem to modify the general symptoms, but it had a pronounced effect on the cystic point, rendering it much less sensitive. In one child, under 2 gm. a day, no further pain at this point could be elicited although it had been marked before. This modification of the cystic point pain confirms the assumption that it is the result of inflammation in the gallbladder. As this inflammation subsides under the drug, the cystic duct ceases to be sensitive. The cystic point is sought with the patient seated. It is located on a line joining the nipple and the tenth costal cartilage.

87 Prophylaxis of Tuberculosis in Children. Cicconardi.—p. 288.

86. **Influence of Roentgen Rays on Callus Production.**—Sgobbo states that several Italian surgeons had noticed that callus did not form as usual in certain knee joint and other fractures that had been examined repeatedly with the roentgen rays. Sgobbo then undertook a series of experiments on dogs, as he describes in detail. The findings confirmed his suspicion that the roentgen rays have a depressing influence on the development of bone callus. With a dose of 15 H units, especially if repeated, the production of callus may be inhibited or it may assume merely a rudimentary form. Even with 5 H units, the injurious action on the callus was pronounced.

101 *Agglutination in the Blood. R. Fåhræus.—p. 369.

101. **Agglutination of the Blood Corpuscles as Sign of Pregnancy.**—Fåhræus remarks that the dictum in recent textbooks to the effect that the blood in pregnancy shows no specific modifications from normal will have to be amended, as his research has shown a marked change in the agglutinating properties of the red corpuscles. Citrated blood from pregnant women showed a much more pronounced and more rapid sedimentation of the red corpuscles than the citrated blood from nonpregnant women. Sedimentation proceeds abnormally fast in the blood of the pregnant and in the blood of women in general compared to men. He records the height of the sediment thrown down in one hour in 103 persons. In the thirty-seven nonpregnant women it never reached above the 11 mm. mark; in the fifteen men tested, it never reached even 5 mm. but in all but two of the pregnant women it reached a height of from 15 to over 80 mm. the sedimentation growing more and more rapid with the progress of the pregnancy. He found further that this accelerated sedimentation occurs as a constant symptom of certain pathologic conditions; and hence, with the possibility of these, its significance as a sign of pregnancy must be carefully weighed. As he expresses the phenomenon, the stability of the suspension of blood corpuscles in the blood is more pronounced in men than in women, and the stability is materially reduced in pregnancy. This seems to be a kind of defensive reaction, and the strength of the reaction can be measured by the amount of sediment thrown down in a given period of time.

He gives an illustration of a fine glass graduated tube, inside a large glass tube filled with water at body temperature, in which the sedimentation can be watched. He also describes a means to apply the sedimentation test to the living subject. A vein in the forearm is selected that does not show branches and a rubber tube is fastened around the arm above and below a stretch of about 10 cm. of the vein, thus shutting off the circulation, and the arm is held vertical for fifteen minutes. At the end of this time, the vein is punctured just below the upper constricting tube. In a pregnant woman, nothing but plasma will be found in the vein at this point, the corpuscles having settled to the bottom of the vein segment. In other women and in men, the puncture shows whole blood, as usual. The settling down of the corpuscles, leaving only plasma at the top, is evident even without the puncture by the change in the tint of the vein at the upper end of the segment. His findings seem to parallel the Abderhalden defensive reactions, and sustain Abderhalden's theory concerning them.

INVESTIGATIONS ON SWIMMING POOLS AT THE UNIVERSITY OF MINNESOTA

H. A. WHITTAKER

Director, Division of Sanitation, Minnesota State Board of Health

ST. PAUL

This investigation was undertaken for the purpose of improving the sanitary condition of the swimming pools at this institution. The first experiments were conducted on the pool located at the men's armory and gymnasium, and later comparative studies were made on a pool that had been recently installed at the women's gymnasium.

SWIMMING POOL AT MEN'S ARMORY AND GYMNASIUM

This pool is located on the ground floor of the building (Figs. 1 and 2). It is 59 feet, 6 inches in length, 25 feet in width, and has a water depth of 7½ feet at one end and 3½ feet at the other. The capacity of the pool, when filled to the normal water line, is about 60,000 gallons. The walls of the pool are constructed of reinforced concrete which is covered with white tile. Life rails are provided at the sides and the ends of the pool, and troughs at the sides. As originally designed, the water was admitted to and drained from the pool through a pipe near the floor at the deep end. After the installation of the pressure filters, a separate inlet pipe was constructed to conduct filtered water to the opposite end of the pool, leaving the outlet pipe to serve as an intake to the filters. This outlet pipe is provided with a connection to the sewer. An overflow pipe near the water surface is connected with this outlet pipe, leading to the sewer. The water in the pool is heated by means of a steam pipe which has one connection at the bottom and another near the surface at the deep end.

The water used in the pool is obtained from the public water supply of the city of Minneapolis. This supply is taken from the Mississippi River and is subjected to sedimentation, coagulation, filtration, and liquid chlorin treatment before distribution. Bathers are required to take a shower before entering the pool, and no bathing suits are worn. The bathers are not subjected to a medical examination before entering the pool, but the attendants are instructed to report any suspected or known cases of disease.

FILL AND DRAW METHOD AND HYPOCHLORITE TREATMENT

The first experiments were conducted on the pool while the fill and draw method and hypochlorite treatment were still in use. The water in the pool was changed twice a week. During the process of filling and until the temperature had reached from 78 to 80 F., steam was applied in the manner previously described. Two pounds of calcium hypochlorite were added each evening when the pool was closed for the day. The hypochlorite was administered by means of a hollow brass cylinder with a hose connection at one end and a nozzle at the other. A one pound can of hypochlorite was placed in the brass cylinder after several holes had been perforated in each end of the can. This apparatus was attached to a hose and the water pressure turned on, which scattered the hypochlorite over the surface of the pool. This method did not break up the lumps of chemical, and many could be seen floating on the surface of the water until broken up by the bathers.

TABLE 1.—RESULTS WITH FILL AND DRAW METHOD AND HYPOCHLORITE TREATMENT

	Number of Tests Averaged	Average Number of Bathers	Pool in Use Since Filling (Hrs.)	Time Between Tests (Hrs.)	Available Chlorin Added to Water (Parts per Mil.)	Bacteria per C.c. (Average)	*B. Coli* Found in C.c. Amounts
City water	3	0	0	0	0	14	0*
City water first day after one day's bathing without treatment	3	65	24	10	0	1,400	1
City water second day after one day's bathing and treated with hypochlorite	4	0	24	24	0.64	3,900	100
City water third day after two days' bathing and hypochlorite treatment twenty-four hours previous	4	65	72	24	0	1,900	1

* B. coli 0 = absent in 100 c.c.

Table 1 includes the results obtained by this method of treating the water in the pool. The laboratory methods used during the experiments recorded in this report are those recommended by the Laboratory Section of the American Public Health Association. The bacterial counts were made on agar at 37 C. (98.6 F.), and the examinations for the *B. coli* group were carried through the "completed test." The pool water was examined for *B. coli* in 0.001 c.c., 0.01 c.c, 0.1 c.c., 1 c.c., 10 c.c., and 100 c.c. amounts. The results show that the sixty-five bathers who used the pool during the first day after it was filled with fresh city water contributed a marked amount of pollution as indicated by the increase in bacteria, and the presence of the *B. coli* group in 1 c.c. amounts. The calcium hypochlorite that was added to the water at the end of the day's bathing reduced the *B. coli* content of the water, a purge, then cleansed the region thoroughly, and the divulsion of the anal sphincter with the fingers was followed by introduction of a large tube wrapped in gauze. Opium was given for five days to leave the anus at rest. Then an oil purge was given, and then opium for three days. By the tenth day clinically normal conditions had been restored. Of course tuberculous fistulas would not be amenable to this treatment, nor when there are complications or extensive destructive lesions, but the cure was prompt and complete in his three cases, including one in which the fistula had developed in a suppurating hemorrhoid. They were all in the sphincter and involved the mucosa and the subcutaneous tissue.

83. **The Painful Cystic Point in Typhoid in Children.**—Genoese found the cystic point painful in all his 30 typhoid cases in children while no pain could be elicited at this point in 24 cases of lobar pneumonia, 40 of bronchopneumonia, 18 of measles, 6 of malaria, 16 each of tuberculous meningitis and peritonitis, 27 of gastroenteritis, 32 of rachitis and 18 of acute articular rheumatism. The pain at the cystic duct was found during the first week of the typhoid in 18, and in the others from the eighth to the eleventh day. The painfulness was not proportional to the gravity of the typhoid, and it gradually subsided as the disease approached convalescence, but kept high to the end in the fatal cases. The liver was enlarged in all and the spleen was palpable. The infection of the liver and bile passages does not seem to be due to ascending infection but to the elimination through the vessels in the liver of the microbes contained in the blood. The liver and the biliary passages hypertrophy under the strain of this task of destroying the toxins and bacteria brought to the liver in the blood. There is probably slight cholecystitis, and this explains the lively pain on pressure of the cystic duct. He gave hexamethylenamin to ten of the children; it did not seem to modify the general symptoms, but it had a pronounced effect on the cystic point, rendering it much less sensitive. In one child, under 2 gm. a day, no further pain at this point could be elicited although it had been marked before. This modification of the cystic point pain confirms the assumption that it is the result of inflammation in the gallbladder. As this inflammation subsides under the drug, the cystic duct ceases to be sensitive. The cystic point is sought with the patient seated. It is located on a line joining the nipple and the tenth costal cartilage.

101 *Agglutination in the Blood. R. Fåhræus.—p. 369.

101. **Agglutination of the Blood Corpuscles as Sign of Pregnancy.**—Fåhræus remarks that the dictum in recent textbooks to the effect that the blood in pregnancy shows no specific modifications from normal will have to be amended, as his research has shown a marked change in the agglutinating properties of the red corpuscles. Citrated blood from pregnant women showed a much more pronounced and more rapid sedimentation of the red corpuscles than the citrated blood from nonpregnant women. Sedimentation proceeds abnormally fast in the blood of the pregnant and in the blood of women in general compared to men. He records the height of the sediment thrown down in one hour in 103 persons. In the thirty-seven nonpregnant women it never reached above the 11 mm. mark; in the fifteen men tested, it never reached even 5 mm. but in all but two of the pregnant women it reached a height of from 15 to over 80 mm. the sedimentation growing more and more rapid with the progress of the pregnancy. He found further that this accelerated sedimentation occurs as a constant symptom of certain pathologic conditions; and hence, with the possibility of these, its significance as a sign of pregnancy must be carefully weighed. As he expresses the phenomenon, the stability of the suspension of blood corpuscles in the blood is more pronounced in men than in women, and the stability is materially reduced in pregnancy. This seems to be a kind of defensive reaction, and the strength of the reaction can be measured by the amount of sediment thrown down in a given period of time.

He gives an illustration of a fine glass graduated tube, inside a large glass tube filled with water at body temperature, in which the sedimentation can be watched. He also describes a means to apply the sedimentation test to the living subject. A vein in the forearm is selected that does not show branches and a rubber tube is fastened around the arm above and below a stretch of about 10 cm. of the vein, thus shutting off the circulation, and the arm is held vertical for fifteen minutes. At the end of this time, the vein is punctured just below the upper constricting tube. In a pregnant woman, nothing but plasma will be found in the vein at this point, the corpuscles having settled to the bottom of the vein segment. In other women and in men, the puncture shows whole blood, as usual. The settling down of the corpuscles, leaving only plasma at the top, is evident even without the puncture by the change in the tint of the vein at the upper end of the segment. His findings seem to parallel the Abderhalden defensive reactions, and sustain Abderhalden's theory concerning them.

ST. PAUL

This investigation was undertaken for the purpose of improving the sanitary condition of the swimming pools at this institution. The first experiments were conducted on the pool located at the men's armory and gymnasium, and later comparative studies were made on a pool that had been recently installed at the women's gymnasium.

SWIMMING POOL AT MEN'S ARMORY AND GYMNASIUM

This pool is located on the ground floor of the building (Figs. 1 and 2). It is 59 feet, 6 inches in length, 25 feet in width, and has a water depth of 7½ feet at one end and 3½ feet at the other. The capacity of the pool, when filled to the normal water line, is about 60,000 gallons. The walls of the pool are constructed of reinforced concrete which is covered with white tile. Life rails are provided at the sides and the ends of the pool, and troughs at the sides. As originally designed, the water was admitted to and drained from the pool through a pipe near the floor at the deep end. After the installation of the pressure filters, a separate inlet pipe was constructed to conduct filtered water to the opposite end of the pool, leaving the outlet pipe to serve as an intake to the filters. This outlet pipe is provided with a connection to the sewer. An overflow pipe near the water surface is connected with this outlet pipe, leading to the sewer. The water in the pool is heated by means of a steam pipe which has one connection at the bottom and another near the surface at the deep end.

The water used in the pool is obtained from the public water supply of the city of Minneapolis. This supply is taken from the Mississippi River and is subjected to sedimentation, coagulation, filtration, and liquid chlorin treatment before distribution. Bathers are required to take a shower before entering the pool, and no bathing suits are worn. The bathers are not subjected to a medical examination before entering the pool, but the attendants are instructed to report any suspected or known cases of disease.

FILL AND DRAW METHOD AND HYPOCHLORITE TREATMENT

The first experiments were conducted on the pool while the fill and draw method and hypochlorite treatment were still in use. The water in the pool was changed twice a week. During the process of filling and until the temperature had reached from 78 to 80 F., steam was applied in the manner previously described. Two pounds of calcium hypochlorite were added each evening when the pool was closed for the day. The hypochlorite was administered by means of a hollow brass cylinder with a hose connection at one end and a nozzle at the other. A one pound can of hypochlorite was placed in the brass cylinder after several holes had been perforated in each end of the can. This apparatus was attached to a hose and the water pressure turned on, which scattered the hypochlorite over the surface of the pool. This method did not break up the lumps of chemical, and many could be seen floating on the surface of the water until broken up by the bathers.

TABLE 1.—RESULTS WITH FILL AND DRAW METHOD AND HYPOCHLORITE TREATMENT

	Number of Tests Averaged	Average Number of Bathers	Pool in Use Since Filling (Hrs.)	Time Between Tests (Hrs.)	Available Chlorin Added to Water (Parts per Mil.)	Bacteria per C.c. (Average)	B. Coli Found in C.c. Amounts
City water	3	0	0	0	0	14	0*
City water first day after one day's bathing without treatment	3	65	24	10	0	1,400	1
City water second day after one day's bathing and treated with hypochlorite	4	0	24	24	0.64	3,900	100
City water third day after two days' bathing and hypochlorite treatment twenty-four hours previous	4	65	72	24	0	1,900	1

* B. coli 0 = absent in 100 c.c.

Table 1 includes the results obtained by this method of treating the water in the pool. The laboratory methods used during the experiments recorded in this report are those recommended by the Laboratory Section of the American Public Health Association. T bacterial counts were made on agar at 37 C. (98.6 and the examinations for the *B. coli* group ried through the "completed test." The por was examined for *B. coli* in 0.001 c.c., 0.01 1 c.c., 10 c.c., and 100 c.c. amounts. The

chlorite he wa
day's *coli*

but did not permanently reduce the bacterial count. This increase in the bacterial count is not unusual under such conditions, for the samples were collected at the beginning of the second day, or twelve hours after the hypochlorite was applied. The hypochlorite probably removed many of the vegetative forms of bacteria and left the spore forming organisms. It has previously been demonstrated[1] in the treatment of Mississippi River water that spore formers develop very rapidly after the removal of the vegetative forms and the hypochlorite has ceased to be active. In view of these facts, the action of the hypochlorite treatment in removing indications of dangerous contamination under the conditions described in the experiment should be interpreted on the *B. coli* results rather than on the bacterial count. The results obtained at the end of the bathing period on the third day, or the day following the hypochlorite treatment, show a marked increase in the *B. coli* content of the water. The reduction in bacterial count may have been caused in part by a retarded action of the hypochlorite on the spore formers. The results of these experiments show that this method of operating the pool does not produce uniformly satisfactory results so far as the sanitary quality of the water is concerned. The method is costly as it necessitates refilling the pool twice a week, and the heating of 120,000 gallons of water to 79° F.

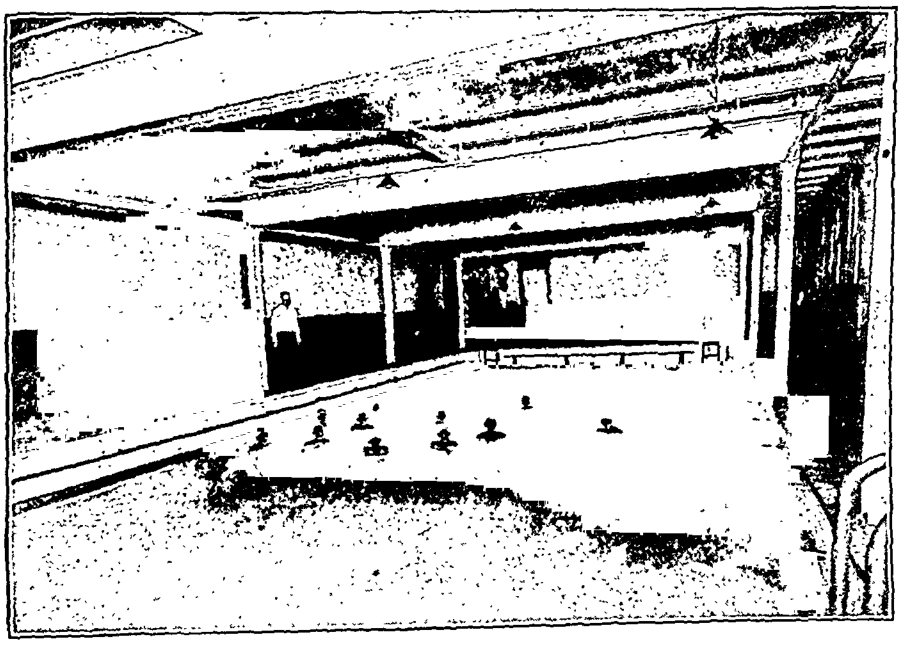

Fig. 1.—Swimming pool at men's armory and gymnasium.

PRESSURE FILTERS

On account of the unsatisfactory physical and sanitary condition of the pool, which resulted from the method previously discussed, pressure filters were nstalled so that the water could be recirculated rough the pool. The filter equipment consisted of entrifugal pump with a capacity of 100 gallons a ute, two coagulant tanks, and two cylindric prese filters (Scaife & Sons). Alum and soda ash were d as coagulants. The maximum capacity of the nt was 144,000 gallons a day, or 60,000 gallons for hours, which is the average length of time the pool use each day. The capacity of the pool is 60,000 ons; therefore, theoretically, the water would be changed during each ten hour day. The plant is located and connected to the pool as shown in Figure 2. Experiments were conducted with the filter plant in operation without any other treatment to determine its effect on the quality of the water in the pool. Table 2 shows the bacteriologic results obtained during four separate tests covering a period of twenty-three days, the plant being operated ten hours each day. It is apparent from the findings that filtration alone gives very irregular bacteriologic results, and that further treatment is required to keep the pool in a satisfactory sanitary condition.

TABLE 2.—RESULTS WITH PRESSURE FILTERS

Number of Test	Pool in Operation Since Filling (Days)	Number of Bathers on Date of Test	Bacteria per C.c.	B. Coli Found in C.c. Amounts
1	1	110	9,200	1
2	2	70	9,000	10
3	16	65	32,000	0
4	23	85	2,300	10

RECIRCULATION, FILTRATION AND LIQUID CHLORIN TREATMENT

A liquid chlorin plant (Wallace & Tiernan Company) was installed as an adjunct to the pressure filters to remove the contamination which persisted after filtration. Experiments were conducted with various amounts of chlorin, as indicated in Table 3. During these tests the pool was cleaned once a week by means of a mechanical cleaning device which consists of a small centrifugal pump driven by an electric motor. To this pump is attached a hose armed at the end with a metallic head. This head is constructed with a narrow slot through which the water and dirt are drawn to the pump and discharged into the sewer. The large particles that may accidentally fall into the pool are removed with hoe-shaped utensils attached to a pole. All bathers took shower baths before entering the pool, and no bathing suits were worn. These results demonstrate that this 60,000 gallon pool can be kept in excellent sanitary condition throughout a ten hour bathing period, during which time 100 bathers may use the pool, provided the water is recirculated through the pool and the filters at the rate of 100 gallons per minute, and 1 part per million of available chlorin is added to the water. Physical and chemical examinations, made on the pool water after three

days' use without filtration, and after six months' use with filtration and liquid chlorin treatment, are shown in Table 4. On comparing the physical results of the unfiltered and filtered water with fresh city water, it will be seen that filtered water, after three months' use, is in better condition than the unfiltered water after three days' use. The chemical results show an appreciable decrease in the alkalinity and an increase in the amount of incrustants and nitrites at the end of the six month period.

TABLE 4.—EFFECT OF BATHING AND TREATMENT ON WATER IN POOL

SWIMMING POOL AT WOMEN'S GYMNASIUM

This pool is located in a semibasement room of the gymnasium building (Figs. 3 and 4). It is 53 feet, 9 inches in length and 24 feet, 6 inches in width. The water depth varies from 3 feet, 6 inches to 7 feet, 6 inches. Its capacity, when filled to the normal water line, is approximately 55,000 gallons. The walls of the pool are constructed of reinforced concrete, and their inside surfaces are faced with mosaic stone. Skimming troughs are provided at the sides of the pool. The pool water is purified by recirculation, a pressure filter, and a liquid chlorin plant. The water purification equipment consists of a centrifugal pump with a capacity of 100 gallons a minute, two coagulation tanks, one cylindrical pressure filter (Scaife & Sons), and one liquid chlorin plant (Wallace & Tiernan Company). The location of this equipment and its connections with the pool are shown in Figure 4. It will be noted that the treated water enters at each end of the pool at the surface of the water, and is removed at a point 10 feet from one end at the bottom of the pool. The water is heated by means of a steam pipe attached to one of the water intake pipes and another pipe used exclusively as a steam inlet. The water used in the pool is obtained from the city supply of Minneapolis.

With the above described equipment in use, the pool is filled once a season, unless it is necessary to drain for repairs, and any water lost through leakage or evaporation is replaced. The bottom of the pool is cleaned once a week with the same apparatus used at the men's swimming pool. The bathers are required to take a shower bath before entering the pool, and bathing suits are worn. The bathing suits are of the trunk type with a short skirt and are made of cotton material.

When the pool was first put in operation, the treated water was admitted at one end of the pool. This was found to be very unsatisfactory, as the water at the opposite end of the pool was not replaced as rapidly as necessary. Bacteriologic results on samples of water collected at both ends of the pool and at the outlet near the center, while this condition existed, are shown in Table 5.

TABLE 5.—RESULTS SHOWING IMPERFECT CIRCULATION OF WATER IN POOL

Sample Collected	Number of Samples	Average Bacteria per C.c.	B. Coli Found in C.c. Amounts
South end near inlet	4	300	100
Center at outlet	4	900	10
North end, 43 feet from outlet	4	1,000	10

A number of tests were made to determine the proper quantity of chlorin to add to the filtered water as admitted to the pool under normal operating conditions. The results of these tests, which are recorded in Table 6, show that one part per million of available chlorin is sufficient to keep the pool water in good sanitary condition for 100 bathers during a ten hour bathing period. The largest number of persons in the pool at any given time during these tests was thirty-five.

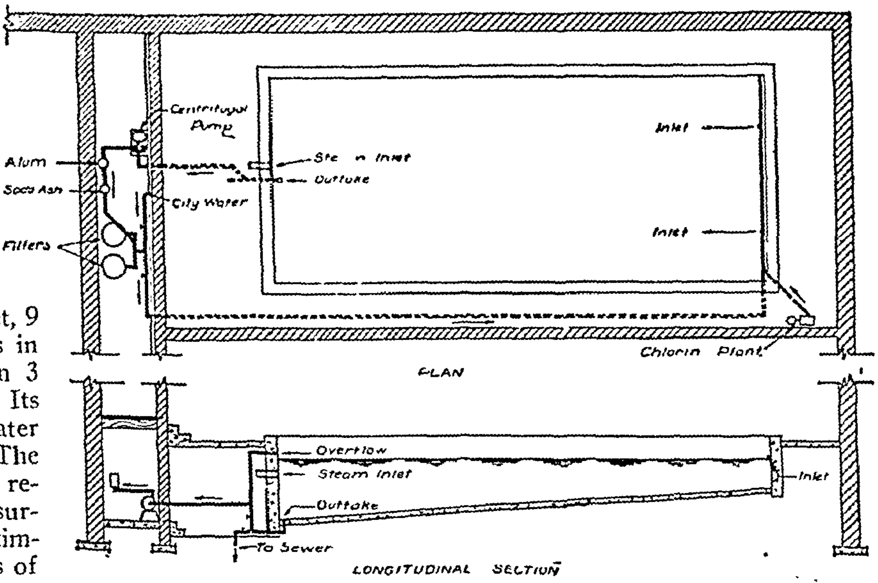

Fig. 2.—Water circulation system of men's swimming pool.

TABLE 6.—RESULTS WITH RECIRCULATION, FILTRATION, AND VARIOUS AMOUNTS OF CHLORIN ON SWIMMING POOL AT WOMEN'S GYMNASIUM

Number of Test	Number of Bathers on Date of Test	Available Chlorin (Parts per Million)	Bacteriologic Results		
			Number Samples	Bacteria per C.c.	B. Coli Found in C.c. Amounts
1	71	0.15	3	600	100
2	35	0.15	2	2,200	0
3	78	0.15	2	3.400	10
4	70	0.39	3	140	100
5	43	1.00	3	4	0
6	110	1.00	2	55	0
7	125	1.00	3	3	0

These results are comparable with those found for the men's pool, and again show that recirculation, filtration and chlorin treatment, when properly carried out, provide a satisfactory means of keeping the water in a swimming pool in a safe condition for bathing purposes.

GENERAL CONCLUSIONS

The results of these experiments show that the fill and draw method, with the daily addition of hypochlorite in the quantities used, did not keep the pool in a satisfactory condition from either a sanitary or an esthetic point of view. Recirculation and filtration improved the physical properties of the water, but did not materially improve its sanitary quality.

Recirculation, filtration and chlorin treatment provide a satisfactory method of keeping the water in these swimming pools in a sanitary condition, provided the detail rules for operation are carried out. The experimental results show that this method will keep the water in a 60,000 gallon swimming pool in a satisfactory sanitary condition for use by 100 persons dur-

ing a ten hour bathing period, the numbe ers
not to exceed thirty-five persons at any on o-
vided the water is recirculated through the e
rate of 100 gallons per minute, and one pa
lion of available chlorin is added to the wate.
parative results on the methods covered b
experiments are shown in Table 7.

RULES TO CONTROL THE OPERATION OF SWIMMING POOLS

1. The general supervision of the swimming pools and their equipment must be assigned to a person who thoroughly understands their operation, and who is provided with the necessary assistance and laboratory facilities for carrying on this work.

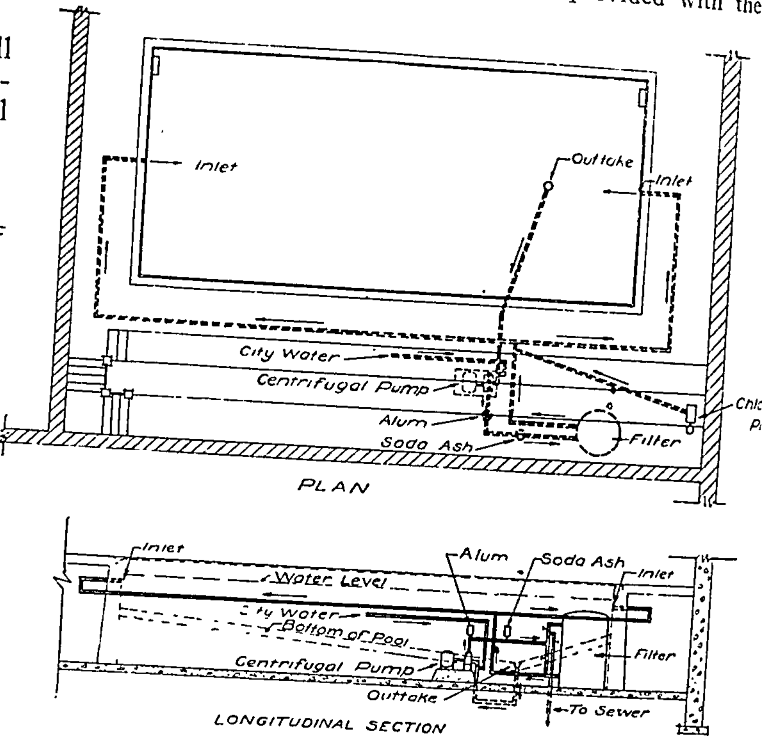

Fig. 4.—Water circulation system of women's swimming pool.

2. The routine operation of the pools must be in the hands of a person especially trained to carry out the detail rules laid down for this purpose and who can keep a daily record of the operating data. (See appended rules for operation and record sheet.)

3. The quality of the water in the pool must meet the following bacteriologic requirements: The bacterial count must not exceed 100 bacteria per cubic centimeter, and organisms of the *B. coli* group must be absent in 10 c.c. amounts.

4. The bathers must be under medical supervision, and all persons suspected of or suffering from communicable diseases must be excluded from the pool. (See appended rules governing persons using pools.)

RULES FOR OPERATION OF SWIMMING POOLS

Pool.—The pool must be cleansed whenever suspended material is present to the extent that is visible to the naked eye. The bottom of
p uld be examined frequently, and

RULES GOVERNING PERSONS USING SWIMMING POOLS

1. Any person who has been exposed to or is suffering from a communicable disease (typhoid fever, diphtheria, scarlet fever, measles, etc.) should report the facts concerning the exposure to the person in charge of the pool and should not use the pool until permission is obtained from the proper authorities.
2. Every person must take a thorough shower bath with the use of soap before entering the pool.
3. Persons found polluting the water with their body discharges will be excluded from the pool. The trough along the side of the pool is provided as a place to expectorate. Do not expectorate in the water.
4. The water in the pool is purified and is safe for bathing purposes, but is not a drinking water; therefore, bathers are warned against swallowing any pool water taken into the mouth.

REMOVAL OF BRAIN TUMOR

REPORT OF A CASE IN WHICH THE PATIENT SURVIVED FOR MORE THAN THIRTY YEARS

W. W. KEEN, M.D.
Emeritus Professor of Surgery, Jefferson Medical College
AND
ALLER G. ELLIS, M.D.
Associate Professor of Pathology, Jefferson Medical College
PHILADELPHIA

HISTORY OF THE CASE

By Dr. Keen

I shall give a summary of the case,[1] and at greater length than I would otherwise do, because it was my first modern brain case; because it shows our technic at that time; because it was one of the earliest operations on such tumors, following by only two years Godlee's in 1885, the very first ever done for a tumor of the brain; and because of the great length of time between the operation and the death of the patient.

History.—T. D., a man, aged 26, first consulted me in May, 1887, at the request of Dr. M. L. Davis of Lancaster, Pa., who furnished me with the following history: When 3 years old the patient fell out of a window, his head striking on some bricks several feet below. The skull on the left side was indented, and (as was disclosed by operation) there was a small fragment of bone detached from the inner table without fracture of the outer table. Evidently the child had struck on the pointed corner of a brick. A scar in the scalp, one-quarter inch long, marks the site of the injury.

He lay motionless for quite a long time as if dead. His recovery was slow, but apparently complete. At intervals, ever since he was 5 years of age, he had had a discharge from the right ear. In 1886 he became partially deaf in the left ear. He had long suffered from frontal headache. In February, 1885, when 24 years old and twenty-one years after the fall, violent epileptic attacks set in. They were followed by intense pain in the head. The attacks took place once or twice a week. By the end of April, 1885, the right arm, leg and face, in succession and in the order named, became paralyzed.

Dr. Davis first visted the patient at the hospital in Lancaster, June 8, 1885. As he approached the hospital he heard him screaming with pain, which was located on the left side of the head. The pain was increased by pressure. The right pupil was dilated and not responsive to light. The left was normal and responsive. Vision in the left eye was good, but in the right eye was imperfect. Aphasia was marked so that he could not converse. The pulse was 60 and irregular; the respirations were 16; there was obstinate constipation and coated tongue, but no fever. Syphilis was eventually excluded. The diagnosis was "pressure on the anterior lobe of the left hemisphere involving the third convolution and extending backward, due to exostosis, tumor or possibly only thickening of the dura." Later and before operation, the diagnosis was more definitely limited to a tumor. The treatment was potassium iodid with arsenic and laxatives.

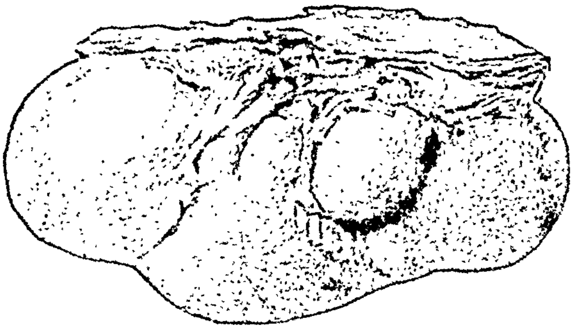

Fig. 1.—Lateral surface of brain tumor, natural size.

The patient's eyesight rapidly failed, and by August, 1885, he had become totally blind, first on the right side and then on the left. In two months his left eye improved sufficiently so that he was able to walk on the street alone. The right eye remained blind for several months, when sight suddenly returned, but vanished in a few hours. This intermittence of vision continued in both eyes. The urine was normal. His mentality was much impaired.

When I first saw the patient, May 30, 1887, in St. Mary's Hospital, Philadelphia, his paralysis had improved so that he could use his arm and walk, though halting very slightly. He was slow of thought and speech, peevish, fretful, and seemed at times dazed. His gait was not spastic. There was moderate deafness, the right pupil was slightly the larger, and the right eye deviated *slightly* outward and upward. The small scar was 3 ¾ inches above the midzygoma and 1 ⅝ inches in front of the interauricular line.

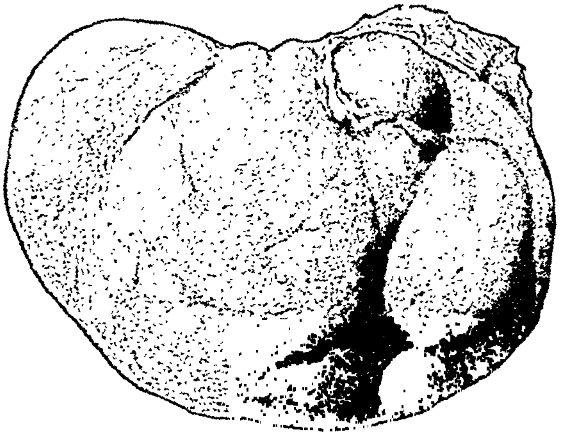

Fig. 2.—Inferior surface of brain tumor, natural size.

June 7, 1887. He had six epileptic attacks while in the hospital, the first since November, 1885. Other attacks the cavity; conclusions, therefore, must be guarded. It would seem, however, that the layer of small pyramidal cells was thinned and the large cells atrophied.

---

[1] The full report of the case is given in the Transactions of the American Surgical Association, 1888, and the American Journal of the Medical Sciences, October, 1888.

The pathologic diagnosis was extensive wound of skull and brain exposing almost the whole of the left lateral ventricle; atrophy of the optic commissure and nerves with extensive fibrosis of the latter, and atrophy of pyramidal cells of the cortex.

The point of special pathologic interest in this case is the extensive exposure of the interior of the left lateral ventricle for a period of over thirty years.

The ventricular area of the central nervous system was greatly increased. So far as the clinical history indicates, there was no symptomatology of changed intracranial pressure, either increase or decrease. The fact that the covering of the wound was depressed *when the patient was in the erect posture is anatomic* evidence that the pressure was increased to no appreciable extent, if at all. When the patient stooped and the scalp protruded, the spinal fluid must have accumulated principally in the left lateral ventricular area. This fluid probably even came from around the spinal cord, but apparently without causing any clinical symptoms.

At necropsy there appeared to be no increased amount of fluid, and the depression of the scalp during life was proof that the wound cavity was not filled by that fluid. The case is unique from the standpoint of duration, and to the best of my knowledge of extent of involvement of the lateral ventricle, and we therefore have none with which it may be compared.

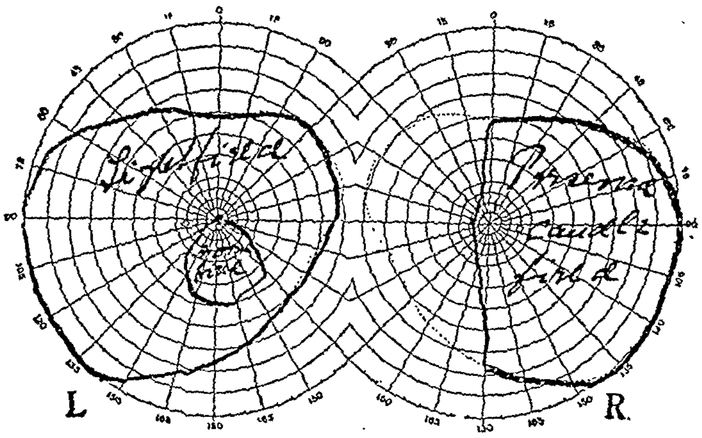

Fig. 7.—Visual fields.

The question arose as to whether the inner surface of the wound became covered by ependyma extending from the ventricle. This proved microscopically not to be the case. According to Weed, however, the ependyma plays a negligible rôle in the production of cerebrospinal fluid, and this would not be important from that standpoint. If, as is generally believed, the fluid is very largely the product of the choroid plexus, the condition obtaining here would be of more importance from the standpoint of pressure than from production of fluid. The case, therefore, was one of longstanding extensive increase of ventricular area of the brain without demonstrable clinical effect.

COMMENT

By Dr. Keen

In the length of life after the operation and the wide open ventricle, this case seems probably to be unique. The only roof to the ventricle was the thin fibrous membrane formed after operation. This was not adherent to the surface of the brain. Therefore, the cerebrospinal fluid had free access to the space between the dura and the pia-arachnoid, as well as to the subarachnoid space.

The cause of the formation of the fibroma, its very gradual displacement downward of the cerebral convolutions with disappearance of the pyramidal cells near the surface and their atrophy deeper down, and the great improvement in the epilepsy have been noted in the history. In spite of his early hemiplegia, the patient was able to walk about for years without a cane and with almost no evidence of any paralysis of leg, arm or face, unless possibly the slight deviation of the right eyeball was a result of the tumor. For one or two years before his death he was confined to his bed because of his increasing general weakness.

The hernia cerebri, and the cuplike depression at the site of the operation when the patient was erect, are shown in Figures 4 and 5. The changed condition from a cup over 2 inches deep to a rounded swelling nearly 1 inch in elevation brought about by muscular compression of the trunk and by the change from the erect to the horizontal position was evidently due partly to the almost instantaneous rush of the cerebrospinal fluid from the other ventricles and from around the spinal cord, and partly to the increase in the blood content of the cerebral veins. This ebb and flow of the cerebrospinal fluid was a most striking phenomenon, the like of which I have never seen in a large experience in cerebral surgery. Even the halting of the breath accompanying the use of the dynanometer, by coughing, etc., would either almost fill up the deep cup by the elevation of its floor, or if continued and with considerable force, would convert the cup into a hill. As in the erect posture the deep cavity was constantly present, it is evident that the total amount of cerebrospinal fluid was less than the normal, yet no cerebral symptoms ever resulted during more than thirty years of postoperative life.

Fortunately, fifteen years ago (Nov. 30, 1903), midway between the operation and the patient's death, Dr. de Schweinitz examined his eyes and gave me the subjoined brief report:

Ophthalmic Diagnosis: Postpapillitic atrophy of optic nerves.

Vision: Right eye, hand movements, eccentric; left eye, $1/30$.

Pupils: Right, 8 mm.; left, 7 mm.; imperfect light reaction.

Muscle Balance: Vertical nystagmus.

Eyegrounds: Right eye, nerve head atrophic; both sets of retinal vessels smaller than normal, and perivascular lymph sheaths distended; numerous yellowish white (colloid?) spots in macular regions. Left eye, similar; less marked shrinking of retinal vessels.

Remarks: The appearances are those of postneuritic atrophy of the optic nerves, in the corresponding loss of direct peripheral vision.

The surgery of the lateral ventricles from this time on interested me very deeply.

Nov. 7, 1888, I read a paper[2] in which I proposed a formal operation to tap and drain the lateral ventricles, an operation which is now almost commonplace, but which then had not been reduced to the exact surgical technic which I formulated.

Jan. 11, 1889, on a boy, aged 4, with a tumor of the cerebellum, I first carried this operation into effect on one side.[3] For certain reasons there stated,[4] February 8, I tapped the opposite ventricle. On the thirty-second and thirty-fourth days after the first operation,

[2] Keen, W. W.: Med. News, Philadelphia, Dec. 1, 1888.
[3] Keen, W. W.: Proc. Philadelphia County Med. Soc., 1889, p. 50.
[4] Keen, W. W.: Proc. Philadelphia County Med. Soc., 1889, p. 85.

I irrigated the two lateral ventricles from side to side, using 8 ounces of a warm 4 per cent. solution of boric acid. As soon as the warm solution began to flow freely through the brain, the child, who had been a little restless, quieted down, saying "it felt good." The choked disk had measured 2.3 mm. in each eye before the first operation; it subsided six days later to 1.09 mm. on both sides. He died on the fifty-second day.

In the same paper[3] I reported two other cases of tapping the ventricles.

At the International Medical Congress in Berlin, in 1890, I presented a complete paper on the surgery of the lateral ventricles, which was a study of ventricular surgery from the time of Paré to that date. Unfortunately, only an abstract has been published,[3] since the original paper was lost by the secretary of the Surgical Section.

I corrected seven instances of deliberate puncture of the ventricles, with two recoveries.

In fourteen cases of rupture of the ventricles from fracture and secondary opening of them (one of which was the present case), nine patients recovered.

I concluded, therefore, that such involvement of the ventricles was in no wise so dangerous as had been supposed, except when an abscess burst into a ventricle or a large hemorrhage into it took place. Instances of both of these conditions were cited. Every one was fatal.

Among all these and many other cases I did not find any one at all resembling the present one, nor have I ever seen any similar case reported since my paper in 1890.

1729 Chestnut Street.

CHRONIC MYOCARDITIS

A CLINICAL STUDY *

HENRY A. CHRISTIAN, M.D.
BOSTON

Notwithstanding the insistence of many internists and the great interest in functional disturbances of the cardiac mechanism aroused by the information obtained from the use of the polygraph and electrocardiograph, there is still a marked tendency among physicians to stress unduly the importance of valve lesions of the heart. If one glances through the systems and textbooks of medicine, one gains the idea that various forms of valve lesions originating from chronic endocarditis form the chief cause of cardiac disease. The diagnosis and treatment of valve lesions bulk large in the chapters devoted to heart disease.

Scattered through the pages there is ample evidence that in the last analysis, muscle function determines cardiac efficiency or inefficiency, and various forms of chronic degeneration and interstitial inflammation of heart muscle are described. There rarely appears, however, a clear description of a common type of chronic cardiac disorder in which the fault is primarily in the heart muscle, and the valves themselves are normal.

In just the same way, textbooks of pathology fail to give any definite satisfactory description of this common type of cardiac lesion, probably because very often, as we shall see later, the heart muscle and the coronary system present no lesion that the pathologist can describe in objective terms.

A possible reason for this condition lies in the fact that usually the type of case I have in mind is merged with cases of organic mitral lesion under the heading "mitral insufficiency." This results from the fact that with myocardial disturbance, there is in most cases a mitral regurgitation from stretching of the mitral orifice, and such cases usually, though not always, have a systolic murmur at the mitral area.

I do not mean to imply that this type of case is not recognized, for it is, but its frequency and importance are not emphasized adequately. It is not likely that I shall add any new data to the clinician's store of information. What I wish to do is to emphasize the relative importance of a group of cases in which primarily the heart muscle fails and in which the valves are intact in the sense of showing no organic lesion. In describing my own experience with them, I may be able to change the usual views on the relative importance of different types of cardiac disease, and to bring out a somewhat clearer conception of what in my experience is a very frequent type of cardiac disease.

Such cases will be spoken of as cases of chronic myocarditis. This is the term commonly used; but it is a poor term, for it implies inflammation, whereas degeneration in the heart muscle is often found. Still worse for the term, the pathologist can frequently find no signs of inflammation or degeneration. If, however, we understand what is meant by the term, it does not make much difference after all, if it is a poor term in an etymological sense. Had I a satisfactory term to suggest, it is not probable that it would be adopted for general use, for new terms are accepted very grudgingly.

As I understand the present day clinical usage of the term "chronic myocarditis," it means a group of cases in which the heart has failed to function properly and the patient has the symptoms and signs of cardiac insufficiency or decompensation. The disturbance is muscular, for the valves show no organic change. Sometimes at death, an increase in interstitial connective tissue is found. At other times, the heart muscle shows degeneration of varying types. Not infrequently the pathologist is unable to find any lesion in the heart muscle, either in gross or after microscopic study. In some cases, the coronaries are sclerosed; in others they are normal. Not infrequently the pathologist finds no cause for the cardiac failure.

It will be recalled that Cabot, in correlation of clinical and pathologic diagnoses, said that in 52 per cent. of the cases diagnosticated during life as chronic myocarditis no such lesion was found at necropsy, and in only 22 per cent. of the cases did the clinical and the pathologic diagnosis agree. To my mind this merely means that the clinician and the pathologist talk a different language and their terms cannot be compared. The patient dies because the heart muscle fails to do its work. The clinician calls such a condition myocarditis, not meaning necessarily inflammation of the myocardium. That the pathologist cannot find any lesion in the heart muscle does not prove the soundness of the muscle but merely the inadequacy of the methods of pathology as far as they fail to show cause for a functional defect.

According to Cabot, many mistakes are made in the clinical diagnosis of chronic myocarditis when the clinical work is checked by the pathologist. In my own experience from a clinical study of the patient, there are few conditions in which we make mistakes

---

* From the Medical Clinic of the Peter Bent Brigham Hospital.

so seldom as in this group of cases. Before necropsy I can say of any of them, "This is a case of chronic myocarditis," meaning thereby, cardiac failure due to myocardial insufficiency without organic valve lesion; and I can prophesy that the pathologist will find an enlarged heart with valves showing little or no chronic endocarditis, that is no thickening or distortion, and the various viscera will show changes subordinate to or secondary to the cardiac failure. Sometimes the heart muscle will show lesions; at other times, not even miscroscopic study will reveal any. Sometimes the coronary arteries will be markedly sclerosed; at other times, they will seem normal. The lesions found in the heart are not at all constant. I was once a pathologist myself, and so the pathologists may pardon my saying that they can offer no satisfactory explanation in an objective sense of what has been observed at the bedside, namely, cardiac failure. Thirteen years ago as a pathologist, I could not satisfy the curiosity of the clinician. Today the pathologist and the pathologic literature are unable to answer my query, "Why has the heart failed?"

CLINICAL OBSERVATIONS

As to the frequency of such cases, in 1917 in my wards at the Peter Bent Brigham Hospital I studied 230 cases of chronic cardiac disease. Of these, 120 were positively diagnosed as chronic myocarditis and five questionably so, while 105 were regarded as cases of chronic valvular disease. Of course among the 105 patients with chronic valvular disease, many had myocardial insufficiency; but this is included in the diagnosis, chronic cardiac valvular disease, and the term "chronic myocarditis" is used only for the patients with cardiac insufficiency, in whom we believe that there is no organic valve lesion. In 1916 the figures were proportionately the same, 156 cases being positively diagnosed as chronic myocarditis and 141 as chronic cardiac valvular disease. In 1915, the figures were 91 and 113, respectively, a total of 367 chronic cardiac cases without organic valve lesion and 359 with organic valve lesion in three years. The diagnosis of simple or uncomplicated mitral insufficiency of organic origin is made relatively infrequently: thus, in 1917, there were ten cases, including three doubtful ones out of a total of 105 with organic valve lesion; in 1916, there were twenty-four cases with seven doubtful ones out of a total of 141, and in 1915 there was a total of twenty-eight out of 113. These figures show an increasing conservatism with regard to diagnosing organic mitral insufficiency. So, looking on chronic cardiac disease from the point of view that I have expressed, in a general adult medical clinic among patients with the symptoms of chronic cardiac disease who are suffering from chronic myocardial disturbance, we see more patients without than with signs of organic valve lesion.

Perhaps our clinic may be unduly conservative in regard to making the diagnosis mitral insufficiency unaccompanied by stenosis. As I have already stated, postmortem examination usually has agreed with the bedside diagnosis in this respect. In forty-two necropsies clinically of this group, the pathologist described very slight thickening of the mitral valve in five and considerable thickening in five, while in thirty-two the valve flaps were not thickened, and the valves seemed in every way normal. Moreover, a study of all our postmortem material, without any reference to antemortem diagnosis, confirms the view that organic mitral disease in older people is relatively infrequent, and when it does occur, stenosis as well as insufficiency is usually present. Dr. Levine, a former assistant,[1] analyzed from our records 247 consecutive postmortem examinations with reference to organic mitral lesions. One hundred and seven, or 41 per cent. of these patients, were over 50 years of age, and of these only two had definite chronic mitral endocarditis, while of 154 under the age of 50, twenty-one had definite chronic mitral endocarditis. This is further justification for conservatism in diagnosing pure mitral insufficiency of organic origin, particularly in older people, in whom we shall see later chronic myocarditis occurs oftenest.

Since the opening of the Peter Bent Brigham Hospital in the spring of 1913, up to Jan. 1, 1918, we have had for study 407 patients, in whom we considered that a cardiac insufficiency was of myocardial origin without organic valve lesion—in the sense of our definition, cases of chronic myocarditis. Of these, 240 were males and 167 females. One hundred and fifteen of these were in the hospital more than once, and many remained in the wards for long periods of time. In all but relatively few there was ample opportunity for careful study of the cases. According to age incidence, the largest number, 143, came in the decade from 51 to 60. In the preceding and succeeding decades, the number was smaller, but about the same number occurred in each of these decades, as shown in the accompanying table. All but forty-one occurred in patients over 40 years of age.

AGE INCIDENCE OF MYOCARDIAL PATIENTS

Age at admission	Male	Female	Total
Below 30	5	4	9
From 31 to 40	17	15	32
From 41 to 50	53	40	93
From 51 to 60	84	59	143
From 61 to 70	52	34	86
Over 71	29	15	44
	240	167	407

ETIOLOGY

The relation of rheumatism and of syphilis to myocarditis is of interest. Of the total of 407 patients, 112 (seventy-four males and thirty-eight females) gave a history of an antecedent rheumatism. Among these, the time relation of the rheumatism to the onset of symptoms showed that fifty-nine had rheumatism within 10 years of their admission for cardiac disease, while thirty had it 25 or more years beforehand. The age of the patients when they had had rheumatism was as follows: from 1 to 10 years, three cases; 11 to 20, ten cases; 21 to 30, sixteen cases; 31 to 40, twenty-two cases; 41 to 50, twenty-one cases; 51 to 60, twenty-three cases; 61 to 70, ten cases; 71 or more, six cases. It is to be noted that sixty out of 112 patients who gave a history of rheumatism were over 40 years of age when they had rheumatism. This makes it improbable that many of these were patients with acute rheumatic fever. Rather it indicates that of those giving a history of rheumatism, more than half in all probability had the arthralgia or chronic arthritis so common in adult ages. This view is further borne out by the fact that of those admitted to the hospital on account of the cardiac decompensation of chronic myocarditis over the age of 50, twenty-nine out of thirty-nine had their rheumatic symptoms within five years of their admission, and many of these a short time before. Few, if any, of these could

---

1. Levine, S. A.: Am. Jour. Med. Sc., 1917, 154, 43.

have had acute rheumatic fever. When these deductions are made, it seems probable that only relatively few of our 407 patients with chronic myocarditis could have had acute rheumatic fever, and so rheumatism in this sense played but a small part in the etiology of this group of cases of chronic myocarditis.

As to syphilis, in order to have constant criteria, the Wassermann reaction has been taken rather than a history of syphilis. The possibility of failure to include those who have had syphilis as judged by history, and the possibility of error of observation in the technic of the Wassermann reaction, are fully recognized; but on the whole, the Wassermann reaction would seem to offer the best grounds for estimating the importance of syphilis as an etiologic factor in these cases. Among a total of 369 patients in whom the reaction was tested, the Wassermann reaction was positive in thirty-five and negative in 334. In only thirty-eight patients was it not tested. The small number of patients with positive reaction is very striking when it is recalled that these were in large part public ward patients, among whom the incidence of syphilis as measured by a positive Wassermann reaction is large. In fact as this percentage of our chronic myocarditis patients is a little less than the average incidence of syphilis for all admissions to our wards, this incidence of syphilis might be regarded as a coincidence. Certainly the figures indicate that syphilis has played a very small rôle in the etiology of this group of cardiac cases, a fact that seems surprising when it is recalled how extensive a part vascular lesions play in the syphilitic process.

Alcohol has been suggested as a cause of myocardial insufficiency. Of our patients, 239, or slightly more than half, admitted the use of alcohol; and in 111 of these, there appears to have been a tolerably chronic use of alcohol. In those admitting the use of alcohol over long periods, directly or indirectly, the alcohol may have been a causative factor. Of this there is no definite proof. If a causative factor, it explains slightly more than one third of the cases. As to its real significance in the group, I feel doubtful.

Disturbances in thyroid activity most certainly lead to myocardial disturbance. Goiter or history of hyperthyroidism, however, was extremely infrequent in our cases and could have been a cause in extremely few of them.

Another factor in producing this condition that should be considered is hypertension. Out of 398 patients in whom satisfactory blood pressure observations were recorded, we found the systolic pressure 150 or lower in 148 patients, from 150 to 170 in seventy-two, and over 170 in 178. As far as etiology of the cardiac failure is concerned, hypertension can play a part in considerably less than one half, for it is not likely that a pressure under 170 would be of any great significance in producing myocardial insufficiency and myocardial lesions from overwork. Even in some of these patients, hypertension is probably a coincident, not a causative factor in the cardiac breakdown. Anyhow, hypertension cannot be regarded at most as a very common cause of chronic myocarditis, though it may be expected in a considerable proportion of the cases.

Chronic nephritis has been looked on as a causative factor in chronic myocarditis. Undoubtedly in some cases of hypertension the primary cause of the high blood pressure lies in a chronic renal lesion, and in such the renal lesion may be considered as a causative factor in the myocarditis. As our functional studies of the kidney have shown, however, very often the hypertension is primarily of vascular origin and the renal lesion is secondary to the high blood pressure and underlying vascular lesion. Then in other cases, renal and myocardial disturbance may have a common cause. Again it is not easy to say whether or not nephritis exists in a given patient with myocardial insufficiency. Very often casts and albumin will be found, but their origin may be in large part in the chronic passive congestion of the kidney. In our experience, very often these patients with decreased urinary output, albuminuria and cylindruria show a marked degree of renal efficiency, as indicated by the phenolsulphonephthalein excretion and by a diuretic response to stimulation. That such a kidney shows enough nephritis to have been a factor in the etiology of the chronic myocarditis seems improbable. Examination of our records shows that, in 202 of the total of 407 patients with chronic myocarditis, there seemed enough renal disturbance to justify the diagnosis of chronic nephritis. My opinion is, however, that in many of these the renal lesion was secondary to or coincident with the cardiac rather than causative. Our postmortem examinations usually have revealed a type and extent of renal lesion that is in accord with this view. In seventeen out of forty-one necropsies, the kidneys were free from chronic nephritis, though showing chronic passive congestion. In nine out of the forty-one, the kidneys were of the arteriosclerotic type, while in only fifteen was there definite chronic nephritis. In only the last group would it seem likely that the renal lesion could have had any causal relation to the cardiac; and even in these, the two processes well might have been coincident.

The incidence of arteriosclerosis in the group is more difficult to judge. For its determination we have available routine observations of peripheral arteries, often only the radial. It is recognized, however, that arteriosclerosis is of irregular distribution and may be present in one group of vessels and not in another. Unless it is accompanied by hypertension it would not seem probable that sclerosis elsewhere than in the coronary arteries could have much influence on the heart muscle, and its presence in peripheral vessels is too unsatisfactory an indication of coronary sclerosis to help in forming a judgment as to the condition of the coronaries. So it hardly seems of value to tabulate clinical observations on peripheral arteries as evidence of the condition of the coronaries. Of these cases, however, forty-three came to necropsy, and twenty-one of the forty-three showed quite definite coronary sclerosis, which was moderate in nine and marked in twelve, while in twenty-two the coronary vessels were relatively normal, that is, they showed no sclerosis or only a few patches of moderate change.

Overeating with resultant overweight or a pathologic obesity is usually considered a possible causative factor in this type of heart disturbance. In our group of cases, 188 out of 393 patients appear to have been overweight, and of those a considerable number were obese. From these figures it appears that a little more than one half the patients were not fat in any sense of the word, and quite frequently these patients were of the thin type. My impression is that obesity was not marked enough to have been a possible causative factor in more than one third of the cases studied at the Brigham Hospital, and in these, of course, it may have been only coincident.

The rôle played by focal infection in causing myocardial disturbances is uncertain. Many, in fact very many, of these patients had had bad teeth with marked pyorrhea alveolaris; decayed root stumps and undoubtedly alveolar abscesses were common. We are only too familiar with the rotten mouth conditions of our ward patients, whatever their disease. Bad teeth are common enough in the myocarditis patients to be an important causative factor, but they are so common in all hospital patients that I feel skeptical as to their etiologic relation to the myocardial group.

In the heart muscle the pathologist found an increase of interstitial connective tissue in twenty-seven out of forty hearts carefully described. Here examination was not exhaustive enough to exclude smaller foci of connective tissue increase, and in the twenty-seven in which it was found the connective tissue very often was only moderately abundant, or the definite patches occupied only a small part of the myocardium. Very often, too, as much or more connective tissue is found in the hearts of older people who, during life, gave no sign of cardiac insufficiency. So, after all, these foci of connective tissue may have no causative relation to the insufficiency. In eight hearts the muscle seemed normal, while in four only moderate fatty degeneration was seen. In one case amyloid degeneration was present.

Electrocardiography is an important method of determining cardiac disturbances which indicate myocardial lesions either functional or organic. In the 407 cases of this group, electrocardiograms were made on 328 patients, with the following results: Thirty patients showed normal curves. Simple left-sided preponderance occurred in eighty-three patients, and right-sided in ten. Thirty-eight patients showed left-sided preponderance with premature or ectopic contractions oftenest having origin in the ventricles, while only one showed right-sided preponderance with ectopic beats. This is as might be expected, 121 with left-sided hypertrophy in contrast with eleven showing right-sided hypertrophy. Sixteen patients had ectopic beats without showing the complex of either left or right-sided muscle preponderance.

Auricular fibrillation occured in ninety-six, and auricular flutter in nine patients. In these, with very few exceptions, left-sided muscle preponderance occurred. In many, ectopic beats were also present. In forty-one cases the electrocardiogram showed the widened or distorted ventricular complex, indicating disturbance in the conduction mechanism, either block in the right or left main stem or more probably degeneration changes involving smaller subdivisions of the conduction system. Here only, more marked changes in the ventricular complex were counted. Slighter degrees of widening or distortion of ventricular complexes occurred in other patients. These are undoubtedly of considerable significance, and will be discussed in a paper by Dr. Howard F. West.

Paroxysmal auricular tachycardia occurred once, paroxysmal ventricular tachycardia once, and sino-auricular block once. In two cases, complete auriculoventricular block was the chief disturbance noted. The patients with auricular fibrillation, auricular flutter and distortion of the ventricular complex, 146 in all, represent from an electrocardiographic point of view the patients with the most serious muscle disturbance, and they form a considerable proportion of the total of 328 studied electrocardiographically. The finding of these changes in the electrocardiogram helps in the diagnosis of this type of case, but it is evident from our figures that often the electrocardiogram shows no change indicative of serious myocardial disturbance, even in patients with badly decompensated hearts; for almost every one of our patients was of the type requiring hospital bed treatment and so represented advanced steps of the disease. Unfortunately our records do not contain enough polygraphic tracings to justify any opinion as to the frequency of pulsus alternans in this group of cardiac disturbances.

Physical signs in these patients are quite characteristic, though there are no pathognomonic signs. The heart is usually enlarged, often markedly so. Hypertrophy occurs by far the most frequently in the left ventricle. Cardiac sounds are not characteristic. Gallop rhythm and tic tac quality are found, but frequently they do not occur. A systolic murmur is frequent, usually loudest at the apex. It varies all the way from a soft blowing murmur to a loud and harsh, or a musical one. In some cases no murmur is heard. In my opinion, the quality or intensity of the murmur is no criterion as to whether there is an organic valve lesion or merely a dilated valve orifice. In the same way transmission of the murmur is of no significance. Given an enlarged heart and any sort of a systolic murmur at the apex in a patient over 40 with decompensated heart, the probability of there being an organic mitral insufficiency is very small. In my opinion, the systolic murmur is the least significant physical sign in this group of cases. The apex impulse usually is diffuse, often not forcible. Very often there is a marked discrepancy between visible pulsation and the palpable heave of the apex region. It is surprising sometimes to feel so weak a thrust from a heart markedly enlarged and to the eye beating forcibly. With the heart condition goes the sign of decomposition—chronic passive congestion of the viscera and edema.

Roentgen-ray silhouette of the heart is not characteristic. Most often it shows well the left-sided enlargement. A number of times, I have seen the heart shadow of a globular form. These hearts are sometimes diagnosed by the roentgenologist as pericardial effusion.

With rest in bed and digitalis, the patients can make most surprising improvement. It is a group in which digitalis is very efficient, whether auricular fibrillation is present or not. Diuretics here have their most efficient action. A waterlogged patient of this group may lose 20, 30, 40 or even 60 pounds of fluid in a week's time and have most of his symptoms disappear. Of course there is a marked tendency for them to recur, especially after return to work; and with recurrence, cardiac response to digitalis becomes less, until the stage is reached when under digitalis the heart progressively deteriorates and no therapy will stay the progress of the disease.

As to what really produces this type of cardiac insufficiency we are ignorant. Various theories have been advanced to explain how minor lesions by position might lead to serious cardiac disturbance. After critical examination these theories, however, seem unsatisfactory. Our clinical studies fail to show any constant cause, and in some cases even after careful pathologic study, the condition of the heart remains inexplicable. Further study of these patients during life and after death is certainly needed before we can have any adequate understanding of the mechanism and the causes of the condition.

SUMMARY

There is a common chronic cardiac condition, in a general hospital for adults equal in frequency of occurrence to chronic valvular disease of the heart, which, for want of a better term, may be called chronic myocarditis. By this term is meant cardiac insufficiency from myocardial disturbance without organic lesion of the heart valves. A very large proportion (366 out of 407) of these patients on admission to the hospital, are over 40 years of age, and somewhat more are men than women. The heart is nearly always enlarged, and usually there is a systolic murmur at the apex; but whatever its intensity or transmission, it is very rare to find any thickening or distortion of the valve flaps or chorda tendineae. Acute rheumatic fever and syphilis are both relatively uncommon in these cases, and neither plays any considerable part in the etiology. Chronic use of alcohol occurs in about one third of the cases. High blood pressure is often found, but is absent in more than half of the cases. Chronic nephritis is often present, as is hypertension; but in seventeen out of forty-one cases at necropsy, the kidneys showed no chronic nephritis. Coronary sclerosis is an important factor in only about half of the cases. Increase of interstitial connective tissue is the lesion most found in the heart muscle, but in numerous cases the heart muscle seems practically normal except for hypertrophy of the fibers. Electrocardiography often gives evidence of disturbed muscle function. About half the cases show auricular fibrillation or flutter or the distortion of the ventricular complex, indicating some disturbance in the conduction system; but in even advanced cases the electrocardiogram often shows no significant disturbance. Digitalis in the earlier breaks in compensation is a very efficient drug, and diuretics produce marked diuresis.

HYPERTROPHIC PYLORIC STENOSIS IN A TWO YEAR OLD CHILD

REPORT OF A CASE *

ALFRED J. SCOTT, Jr., M.D.
LOS ANGELES

In a survey of the literature for cases of hypertrophic pyloric stenosis, we find very little mention of cases after the second or third month. The first reported case is the famous one of Beardsley,[1] in which a boy showed symptoms shortly after birth, and up to his death at the age of 5 years.

Shaw and Elting[2] in 1904 reported a case in which the patient showed symptoms from the seventh or eighth month but was not operated on until the age of 16 months. The child lived.

Arreger, quoted by Osler,[3] reported a case in a child of 5 years, and Rosenheim, quoted by Holt,[4] reported a case in which the patient had had no symptoms until he was 3 years old, and at the age of 5 years had had the first marked symptoms. He had not been operated on, however, until he was 6½ years old.

All the references mention cases occurring at the usual age, or in young adults. Therefore, I thought my case would be of interest, because of its rarity, but I offer no hypotheses or theories.

REPORT OF CASE

J. B., a boy, aged 22½ months, Jewish, was brought to the observation cottage of the county hospital, July 22, 1917, with a complaint of vomiting, loss in weight, and extreme restlessness.

He was the youngest of five children, the first of whom had died when 3 days old, the mother having convulsions. The second child, who was 8 years old, was well, but not strong. The third had died "of abscess in the head" at the age of 21 months. The fourth, who had been bottle fed, had died at the age of 5 months. The mother had died from tuberculosis three months previous to consultation, aged 26. The father was living and well.

The first three months at home, the child had been fed oatmeal water and cow's milk. There had been no history of vomiting. The child had had some colic, but had seemed healthy and strong, and had gained in weight. There had been a good deal of constipation, but milk of magnesia had corrected this. Then the child had been put out to board with two or three different women. When 10 months old, he was very skinny, and had a good deal of gas. He was teething at the time, and vomiting a little, but gained rapidly in weight under careful diet. No further trouble had occurred until he was about 15 months old, when he was given a banana, which he had vomited. During these months he had whooping cough. He had been in the Jewish Orphans' Home for a time, but there had been no history of vomiting there. About a month before I saw the child, he had become nauseated one evening after supper. A physician from the neighborhood was called, who gave him a hypodermic injection to produce vomiting. The next day the child was taken to the Children's Hospital, where he was kept for three days. He vomited occasionally, but developed no serious symptoms, and no diagnosis was made. After going home, he was well for two days, when he started to vomit again. Another physician saw him a few times, and advised that he be taken to the county hospital. No diagnosis was made on this occasion. At the hospital it was learned that three weeks previously, the child had been seen chewing firecrackers, but whether or not some of them had been swallowed was not known.

Physical examination was negative except in the abdomen, which was scaphoid with visible peristaltic waves, but with no palpable tumor. While in the observation cottage at the county hospital, a fluoroscopic examination was made, but nothing was seen to pass through the pylorus.

Tincture of belladonna, 4 drops every four hours, was ordered, and 4 ounces of undiluted milk once in from three to six hours. Sometimes this was retained and other times vomited. Nutritive enemas were given, some being retained and some not. The temperature varied from 101 F. on entrance, to normal.

When the child was transferred to the children's ward, July 25, three days after entrance, the same findings as in the observation cottage were noted.

Stomach washings of soda followed by gavage of barley water and egg albumin every six hours gave relief, and the food was retained. The first washing brought up a greenish brown fluid with a foul odor. After some of the washings, only half as much water was returned as was used in the washing, at the other times nearly twice as much. The gavages at first seemed to satisfy and quiet the child, but later they did not. The enemas brought forth small, brown, liquid stools. The child kept getting weaker, and on the twenty-eighth day, three days after entrance to the children's ward, and six days after entrance to the hospital, it was deemed advisable to operate. Dr. Henry Dietrich saw the patient in consultation, and concurred in pronouncing the case operable, but reserved his diagnosis.

The operation, performed at 7:30 o'clock p. m., July 28, by Dr. W. L. Huggins, revealed a typical hypertrophied pylorus such as is seen in congenital pyloric stenosis. Expos-

[2] Shaw, H. L. K., and Elting, A. W.: Arch. Pediat., 1904, **21**, 892.

[3] Arreger, quoted by Osler, William: Modern Medicine, 1908, 5, 304.

[4] Rosenheim, quoted by Holt, L. E.: Hypertrophic Stenosis in Infants, The Journal A. M. A., May 26, 1917, p. 1517.

ing the pylorus, the incision was made longitudinally down to the mucosa (Rammstedt), and revealed the same cartilaginous texture seen in typical hypertrophic pyloric stenosis. The mucosa was accidentally nicked at the stomach end, so a pair of forceps were inserted in the pylorus, but nothing was found to account for the obstruction other than the thickened tissue. The closure was a modified pyloroplasty and the usual abdominal tier closure.

The child was returned to bed in a fair condition, but with a very weak pulse. The rectal drip of glucose and sodium bicarbonate was started. The child vomited some greenish yellow fluid and was very restless. The drip was repeated during the night. The restlessness increased.

At 5 a. m. the following day, the temperature was 101.6; the pulse 106, and respiration, 78. At 8 a. m. the temperature was 106.2, the pulse 180, and respiration 84. At 11 a. m., the pulse was very weak. The temperature was 104.6, the pulse 180, and respiration 80.

Five hundred c.c. of physiologic sodium chlorid solution were given by hypodermoclysis. The child died at 1 p. m. No postmortem was held.

COMMENT

The operative findings were very much of a surprise, as clear symptoms of pyloric stenosis are very uncommon in children the age of this one. Children are difficult subjects on whom to do a fluoroscopy, as they are usually very restless and easily frightened.

I feel that if the operation had been done sooner, before such a marked state of exhaustion had taken place, we might have saved the child; but we delayed too long. On the other hand, he seemed somewhat improved with the washings and gavages, and we thought we were dealing with a pylorospasm.

Medical history records cases in which pyloric stenosis has been found by the operator on opening the abdomen for other conditions. The fact that there have been a number of cases reported in young adults shows that the condition may obtain for months or years with very mild symptoms, or none at all.

1501 South Figueroa Street.

REPORT OF A CASE OF PSEUDOLEUKEMIA INFANTUM (VON JAKSCH'S DISEASE)

DAVID A. ROTH, M.D.
Resident Physician, Hospital Santo Tomas
PANAMA, R. P.

Since von Jaksch first called attention to the association of splenomegaly with anemia in children, a number of similar cases have been studied under the name of von Jaksch's disease. But as most of the cases reported differ in their clinical features and pathologic findings, the existence of the condition as a distinct disease of the blood is still a matter of dispute. Pseudoleukemia infantum is now defined as a rare disease of childhood, characterized by a severe anemia, marked enlargement of the spleen, some enlargement of the liver, and a chronic course with one or more relapses. The anemia is the most constant feature of the disease. It presents the combined blood picture of pernicious anemia and leukocytosis or lymphocytosis. While splenic enlargement is said to be an important diagnostic finding, it cannot be so considered in this country where chronic malarial spleens are common among the children. The more common children's diseases, notably rickets, gastro-enteritis, and to a lesser extent hereditary syphilis, are found in association with von Jaksch's disease. This has caused some observers to attach etiologic importance to these diseases; but the matter has yet to be proved.

REPORT OF CASE

History.—W. B., boy, aged 2 years, born in Panama, of Martiniquan parents, admitted to Hospital Santo Tomas, Jan. 4, 1917, with a history of diarrhea, drowsiness, vomiting, loss of appetite, general weakness and a gradual change in color, which the mother described as "turning yellow," had been ill for an indefinite period, probably several months, but the condition became aggravated, a few days prior to admission, with cough and fever. The past medical and family histories were negative. The temperature on admission was 40.2 C. (104.3 F.); pulse, 130, and respiration, 36.

Physical Examination.—The patient was well developed. He appeared to be comfortable but was somewhat dull and unresponsive. Slight scleral jaundice was present. All superficial lymph nodes were enlarged. The head was square with the anterior fontanel open. The mucous membrane of the lips and mouth was of a peculiar yellowish pallor. There were but five upper teeth, no lower teeth being present. Nodular projections were found on both sides of the costrochondral junction. There were some scattered, moist râles over both lungs. The heart was negative. The upper limit of splenic dulness extended to the sixth interspace in the midaxillary line. The lower border of the spleen extended 1 inch below the left costal border in the anterior axillary line. The lower edge of the liver was palpable half an inch below the right costal border. The lower extremities showed a moderate degree of bow-leggedness. The knee jerks were increased.

Laboratory Reports.—The urine was negative. The stools showed a few pus cells; otherwise they were negative. Blood examination, Jan. 6, 1917, for which deep puncture and some pressure were necessary to obtain a fair sized drop, revealed: erythrocytes, 1,440,000; leukocytes, 22,000; hemoglobin, 25 per cent.; color index, —1; differential count: polymorphonuclears, 42 per cent.; small lymphocytes, 37 per cent.; large lymphocytes, 8 per cent.; large mononuclears, 8 per cent.; transitionals, 4 per cent.; mast cells, 1 per cent. Poikilocytes, nucleated reds, both large and small; stippling, etc., were present in large numbers. No malarial organisms were found. Repeated blood examinations showed the average number of erythrocytes to be about 1,600,000, with many nucleated cells and other pathologic elements. The leukocytes varied in number from 22,000 to 25,000, of which about 50 per cent. were lymphocytes. The fever was at no time affected by quinin.

Clinical Course.—There was no change in the patient's general condition for the following ten days. During that time, the temperature was of a septic type, at times, reaching as high as 40 C. (104 F.) in the evening with a daily variation of from 2 to 2.5 degrees C.

January 14, slight improvement was noted. During the following twelve days the temperature remained approximately normal. The general nutrition was improved and the jaundice practically disappeared.

January 18, the erythrocytes numbered 3,200,000, the leukocytes 8,000. Nucleated reds were rare, but stippling and poikilocytosis persisted to some extent.

January 25, a relapse to the original condition occurred.

February 16, the child was in a semiconscious state, scleral jaundice being deeper than at any time during the disease. Respiration was rapid, with numerous, moist râles on both sides of the chest. The abdomen was distended with easily detectable flank dulness. Blood examination at this time revealed nothing unusual, except that the leukocytic count reached the high mark of 42,000.

Throughout the course of the disease it was observed that any improvement in the child's condition was accompanied by an increase in the number of erythrocytes and a diminution in the pathologic elements of the blood and in the number of leukocytes, whereas a relapse was followed by an increase in the number of leukocytes and a decrease in the number of erythrocytes. This would indicate that both the anemia and the leukocytosis were due to the same pathogenic agent.

Feb. 18, 1917, the child died.

Necropsy Report (2584).—The body was that of a well nourished child about 3 years of age. A mucopurulent fluid was running from both nostrils; the tonsils were not enlarged; five upper teeth, and no lower teeth were present; the sclera of both eyes was jaundiced; the muscles were well developed.

Abdomen: A small quantity of a straw colored fluid was present in the abdominal cavity. The appendix was normal. The urinary bladder was distended. The stomach was small and contracted. The mucous membrane was covered with a whitish mucoid material. The rugae were prominent and obliterated with difficulty. The gallbladder was distended, but emptied easily. There was no evidence of any peritonitis.

Thorax: When the sternum was removed, the lungs collapsed. The right lung had four lobes and the left three. Both lungs crepitated throughout and contained no tubercles. The lower lobe of the left lung was congested. On section it was edematous, and the bronchioles contained a yellow purulent fluid. This lobe appeared to be jaundiced. The middle lobe was deeply congested and appeared to be pneumonic. The cut sections sank in water. The lower lobe had the appearance of bronchial pneumonia.

Heart: This was enlarged, and the right side was dilated and filled with a goose fat clot. The musculature was flabby. The pericardium was edematous.

Spleen: This was enlarged, firm and deep blue. The capsule could not be stripped easily. The pulp was very dark red and not very friable. The normal markings were absent.

Kidneys: These were slightly enlarged, and pink. The capsule stripped easily, leaving a smooth surface. On section the organ was yellowish pink. The cortex was about normal in size. Around the papillae there was a zone of yellowish discoloration.

Liver: This was normal in size, and brownish. On section the tissue was markedly bile stained. The hepatic vessels were engorged with blood.

Head: The anterior fontanel was open. When the calvarium was removed, fluid ran out. The cortex was markedly edematous, very soft, flabby and anemic. The ventricles were filled with a clear fluid.

Anatomic Diagnosis.—The diagnosis was: marked anemia of the brain; bronchitis; left sided bronchopneumonia; congestion of the liver; splenic tumor, and general anemia.

The pathologic report of the Board of Health Laboratory, Ancon Hospital, was as follows: There was an extreme fatty metamorphosis of liver, kidney and heart. The blood sinuses of the liver, spleen and kidney contained an abundance of micro-organisms that were, perhaps, postmortem invaders. There was passive congestion of the liver and spleen. No spirochetes were found in any of the tissue. Nothing was found to indicate the etiology of the disease present.

Treatment.—In addition to the general hygienic measures, quinin, solution of potassium arsenite (Fowler's solution) and syrup of ferrous iodid were given a fair trial but proved useless.

Balance Between Food Fuel and Work.—A British scientific commission has reported that if the workman be undernourished he may, by grit and pluck, continue his labor for a certain time, but in the end his work is sure to fail. It makes no difference what the nutritive condition of the person is, if a certain job involving muscular effort is to be done, it always requires a definite amount of extra food-fuel to do it.—Lusk, Food in War Time.

Military Medicine and Surgery

AGGLUTININ RESPONSE AFTER ARMY TRIPLE TYPHOID VACCINATION *

ERIC A. FENNEL, M.D. (Cincinnati)
First Lieutenant, M. C., U. S. Army
WASHINGTON, D. C.

The efficiency of typhoid vaccination in the United States Army, as developed by Colonel Russell, is now a matter of history. That typhoid inoculation results in the production of an effective immunity over a considerable period of time has long since been proved, both experimentally and clinically. On the one hand, agglutinin and bactericidal experiments, and on the other, the vital statistics of the Army since the typhoid inoculation became an order, are quite conclusive.

The history of paratyphoid and the mixed inoculations is now being made. There is little reason to doubt that they will be as successful as the typhoid inoculations. To determine to what extent specific agglutinins for the three types of organisms used by the Army were produced by the men inoculated, at the suggestion of Lieutenant-Colonel Whitmore, the series of cases here summarized were studied. The series included men who had had no typhoid or paratyphoid and no vaccination, and men who had had the commercial vaccine, either typhoid or mixed, at a variable time previous to the Army vaccination.

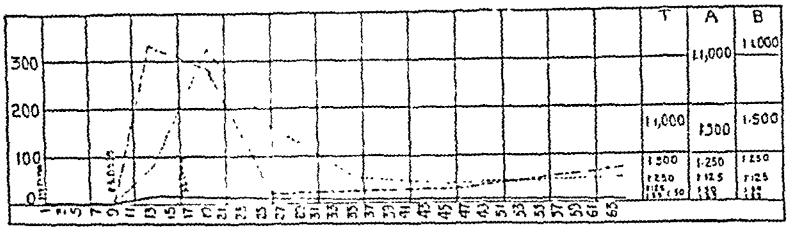

Chart 1.—Typhoid vaccine, June, 1915. Mixed commercial vaccine, July, 1916. Army vaccine, September, 1917. First injection, slight headache, slight local reaction; highest temperature 99 F. Second injection, severe headache, nausea and vomiting, slight diarrhea, slight pain in abdomen; local reaction slight; highest temperature, 103. Third injection, headache, dizziness, with slight local reaction; highest temperature, 102.6. In the charts the solid line represents typhoid, the line of dots and dashes paratyphoid A, and the line of short dashes paratyphoid B.

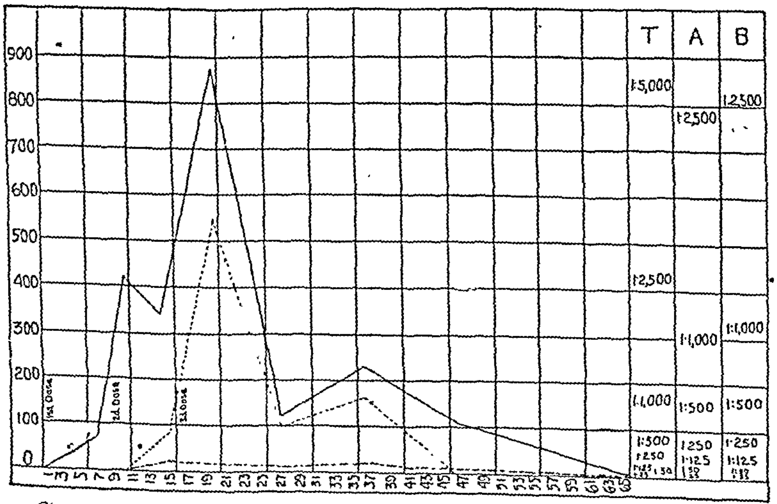

Chart 2.—Triple commercial vaccine, 1916. Army vaccine, September, 1917. First injection, no general reaction, slight local; highest temperature, 99 F. Second injection, no general, slight local reaction; highest temperature, 99.2. Third injection, no general, almost no local reaction; highest temperature, 99.

---

* From the Department of Pathology, Army Medical School.

This work, then, demonstrates that agglutinins are produced, not only for typhoid, but for paratyphoid A and paratyphoid B as well; it offers an opportunity to see the relationship between local and general reactions, and the antibodies produced; it offers an opportunity to study the bearing a previous inoculation has on the production of agglutinins.

The accompanying charts are almost self-explanatory. They are the more typical and instructive of a group of thirty, and represent graphically the variations of the typhoid and paratyphoid agglutinins under the influence of antityphoid vaccination, as formerly and at present administered by the Army. The continuous line represents the typhoid, the line of dots and dashes the paratyphoid A, and the line of short dashes the paratyphoid B.

The varying altitudes to which these curves rise on successive days is expressed, not directly by dilutions, but by the number of agglutinin units per cubic centimeter of serum, determined by the Dreyer method. These charts are therefore not only comparable within themselves from day to day, but comparable with each other and comparable with the results obtained by other workers using the same technic.

The method of administering bacterial vaccines in use by the Army at the time these studies were begun was as follows: The first dose consisted of 500 million typhoid. The second dose on the fourth day following consisted of 375 million paratyphoid A, plus an equal number of paratyphoid B. On the fourth day following, 1,000 million typhoid were given. On the fourth day following this, 750 million each of paratyphoid A and B, were given. Four days later the final typhoid dose of 1,000 million was given and again in four days the final paratyphoid A and B dose of 750 million was given.

During the course of these studies the method was changed so that the first dose contained, combined, 500 million typhoid and 375 million each of paratyphoid A and B. The second dose of double the amounts was given seven days later. The third dose, identical with the second, was given seven days later. Some of the accompanying charts represent some of the first routine cases under the new method at the Army Medical School.

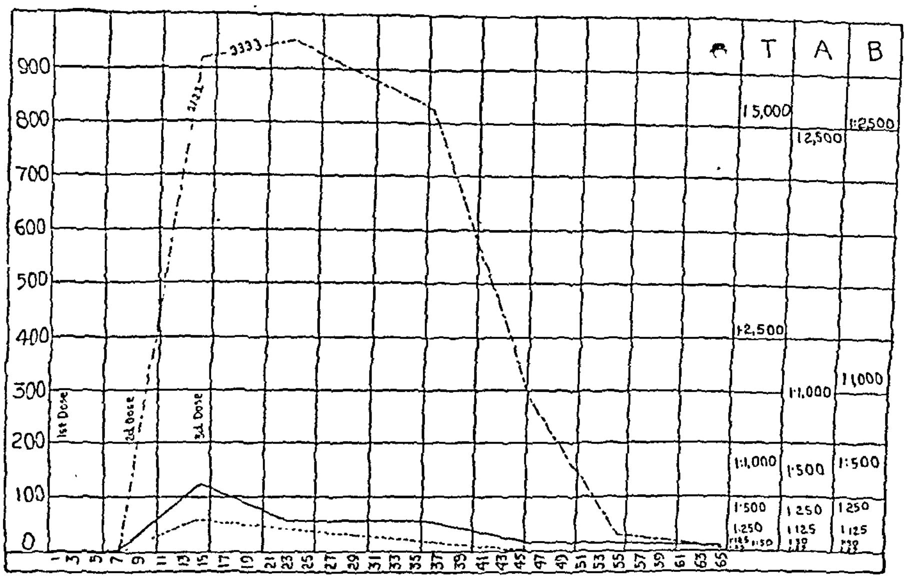

Chart 3.—*No previous vaccination. Army vaccine, September, 1917.* First injection, slight systemic and local reaction; highest temperature, 99.8. Second injection, slight systemic and local reaction; highest temperature 99.8. Third injection, moderate systemic and slight local reactions; highest temperature, 100.0.

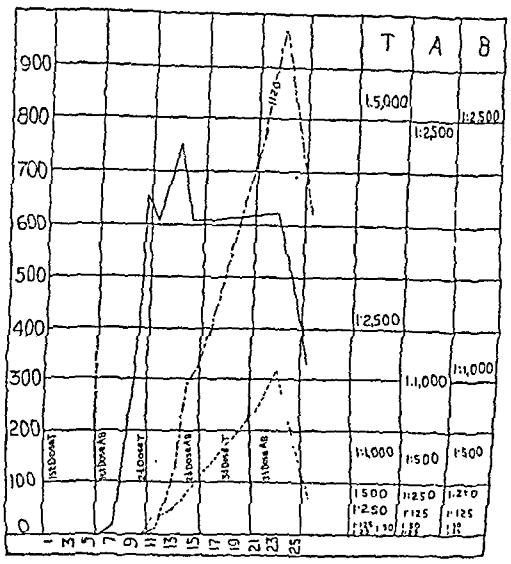

Chart 4.—*No previous vaccination. Army vaccine, July, 1917.* Severe local and general reaction after second paratyphoid *A* and *B*. *Moderately severe general reaction after the second typhoid.* Otherwise the reactions were negligible.

METHOD

Briefly stated, the method employed is as follows: Standard agglutinable cultures were obtained from the Department of Pathology, University of Oxford, for typhoid, paratyphoid A and paratyphoid B. Each one of these cultures represented one of standard opacity, with a given and noted factor of agglutinability. These cultures were formaldehyd killed and of recent manufacture. The serums to be tested were set up in macroscopic agglutination tubes, in dilutions with physiologic sodium chlorid solution ranging from 1:25 to 1:5,000. To each of the tubes was added a constant quantity of the standard culture. The tubes were then placed in a water-bath at 55 C. for two hours, allowed to cool for fifteen minutes, and read for the highest dilution in which agglutination, visible to the naked eye, occurred without sedimentation. The dilution of the serum in this tube was then divided by the known factor of the culture used, resulting in the units of agglutinins per cubic centimeter of serum. These units were then charted.

When I was ordered to my station at the Army Medical School, I continued the observations in a series of six cases, begun by Dr. W. C. Davison, who was unable to continue them through his change of station. At the same time I added several new cases to the group. These studies were at that time interesting, not only in that they gave some idea of the height to which the typhoid agglutinins were developed, but also in that they gave positive information that very definite quantities of agglutinins for paratyphoid A and particularly for paratyphoid B were being produced. The relative celerity with which individuals responded by the production of specific agglutinins was a somewhat variable but interesting demonstration. The persistence and gradual reduction of the quantity of agglutinin units in this first group of men could not, unfortunately, be observed over any extended time, since the men whose serums were being tested were all lieutenants in the Medical Reserve Corps, temporarily stationed at the Army Medical School and leaving for distant stations on the completion of their vaccination.

I therefore began a study of fifteen of my classmates, student candidates for the Medical Corps of the Army. This series of cases I could keep under observation a greater length of time, though the existing emergency has made it shorter than it might have been; however, the time has been long enough to yield some interesting data.

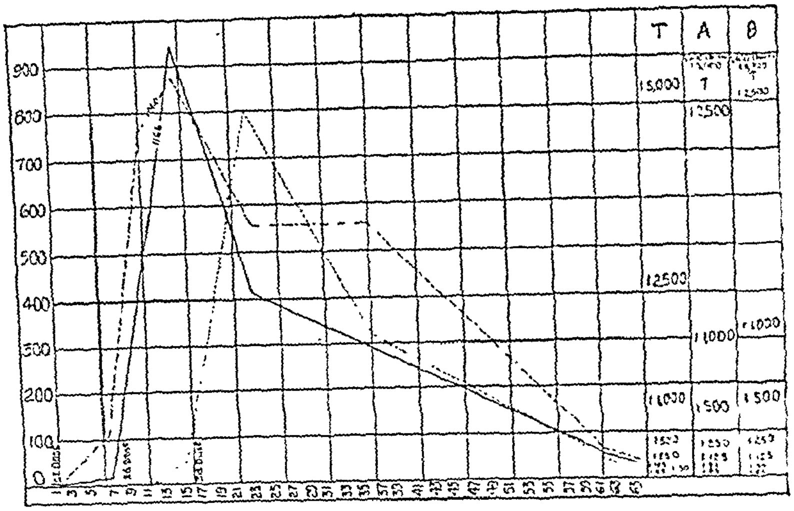

Chart 6.—No previous vaccination. Army vaccination, September, 1917. First injection, slight headache, slight local reaction; highest temperature, 99. Second injection, moderately severe local and general reactions; highest temperature, 100.4; duration of fever, two days. Third injection, no general, very slight local reaction; highest temperature, 99.

The method of titration and the method of preparing new quantities of the standardized agglutinable cultures, as practiced at the Army Medical School, have been described previously.[1]

FACTS BROUGHT OUT

Though, as mentioned before, the charts speak for themselves, it might be worth while to draw attention to certain points: Previous typhoid vaccination (and the same is true of paratyphoid A and B as well) has the effect of repressing the formation of a high unit content, though some change is noticed. It does not altogether inhibit the production of specific agglutinins, but serves rather to retard it, and restrain it after production begins. In some cases it seems to have very little effect on the production of agglutinins, and they rise in a curve similar to previously uninoculated cases. In no case did previous inoculation seem to augment agglutinin production. In one case (Chart 10) in which the patient gave a history of having had typhoid fever at the age 4, and of having been inoculated one and two years previously, there was a definite reduction of the agglutinin units, never returning to the original number, and approximating it only after twenty-five days.

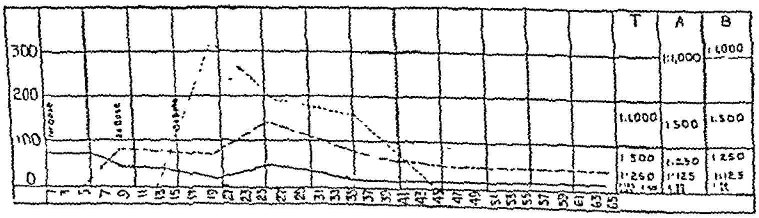

Chart 7.—Typhoid vaccination, 1915. Army vaccine, September, 1917. First injection, moderate general and local reactions; highest temperature, 99.5. Second injection, general reaction very severe; severe chill one hour after injection, lasting a half hour; patient went to bed; one hour after inoculation, temperature had gone to 105 and two hours later to 106, accompanied by delirium and profuse sweating; following day, temperature varied from 102 to 103, and approximated normal on succeeding day; axillary tenderness followed for several days. Third injection, mild local and general reactions, highest temperature, 99.

This feature is of importance and is to be kept in mind in the diagnosis of typhoid or paratyphoid A or B fever, by the Widal reaction.

Hamilton[2] is of the opinion that the Widal reaction is of no value in the diagnosis of typhoid fever, in previously inoculated individuals. Dreyer, Walker and Gibson[3] and Davison[4] present arguments in support of their opinion that macroscopic Widals, with a standardized agglutinable culture, done at intervals, to demonstrate fluctuations upward or downward, in agglutinin content, have a definite diagnostic value. However, the fluctuations that appear in some of these charts, after the titer has neared the base line, occur in the cases of quite normal men, with no physical findings to suggest their cause. In a later series of cases, which was not only continued over a greater length of time, but in which the titrations were done much more frequently, these fluctuations without apparent cause are much accentuated. In view of this fluctuation for some months after vaccination, it seems ill advised to draw any diagnostic conclusions from such fluctuations, in a case of fever. While such fluctuations may be pointingly suggestive, they are not at all to replace, diagnostically, an early blood culture or the isolation of the organism from the stool.

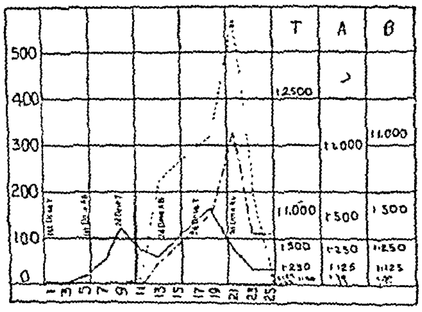

Chart 5.—Army vaccine, July, 1917. No history obtained.

In only one case was a total absence of agglutinin production observed (Chart 8). This case showed a normal production of paratyphoid A agglutinins, a production of typhoid agglutinins consistent with a previous typhoid inoculation (interesting because the previous vaccination took place four years ago), and no agglutinins for paratyphoid B.

In another case, typhoid and paratyphoid A agglutinins responded normally, while paratyphoid B agglutinins failed to make their appearance until the twenty-first day after inoculation, after which they persisted in a normal manner. This chart (Chart 9) is interesting in that it shows a secondary rise of all three types of agglutinins, following shortly after the assumption of the patient's duties in the vaccine room, where he was constantly exposed to infection. During this time he presented an illness with malaise, rise in temperature, etc., sufficiently simulating in a clinical way, an ambulatory case of typhoid fever, to make a blood culture advisable. Blood cultures revealed no growth, and complete recovery followed in a week or ten days. Reliance on the symptoms and the fluctuations in the agglutinin content, in this case, might have led to a diagnostic error.

[4] Davison, W. C.: The Diagnosis of Enteric Fever (Typhoid and Paratyphoid A and B) by Agglutination Tests, The Journal A. M. A., April 22, 1916, p. 1297.

To indicate that the repression not only of typhoid, but also of paratyphoid A and paratyphoid B agglutinins must be considered in previously inoculated patients when the triple vaccine has been used, Chart 1 presents the repression of typhoid agglutinins, Chart 2 that of paratyphoid A, and Chart 3 that of paratyphoid B. The probability of cross-agglutination in each of these cases must be considered, as well as the history of previous vaccinations.

While cross-agglutination may take place, the units within which this may take place have been quite definitely determined, and need not be considered in those charts in which all three agglutinins rise to a fair height. In a typhoid monovalent serum of 800 agglutinin unit content, the cross-agglutinin unit content for paratyphoid A is 65 and that for paratyphoid B is 80. In a paratyphoid A monovalent serum of 3,000 unit content, the cross-agglutinin content for paratyphoid B is 160 and that for typhoid is 65. In a paratyphoid B monovalent serum of 3,750 unit content, *the cross-agglutinin* content for paratyphoid A is 130, and that for typhoid is 65.

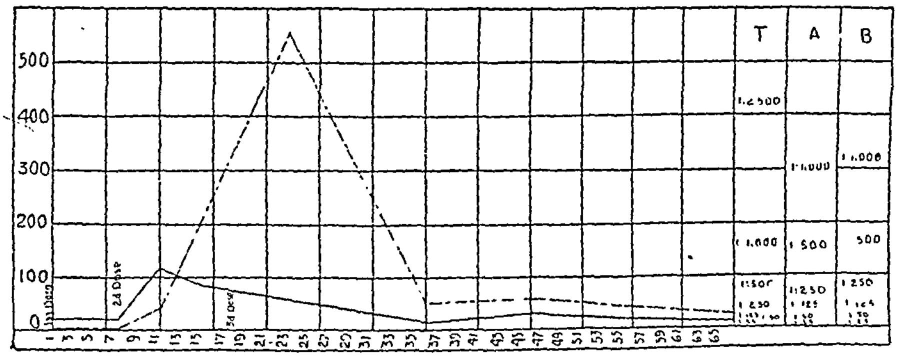

Chart 8.—Typhoid vaccine, November, 1913. Army vaccine, September, 1917. First *injection, no general, slight* local reaction. Second injection, malaise and chills, considerable local reaction; highest temperature, 100. Third injection, no general, very slight local reaction.

The very generous development of all three types of agglutinins in the case of Chart 6 might be explained by the patient's rather wonderful physique and his previous freedom from infection or vaccine.

There seems to be no logical relationship between the systemic or local reaction and the number of units of agglutinins produced. These reactions are almost always of a negligible character, and in spite of the fact that medical men are notoriously introspective, only one of the subjects of this series complained with reason (Chart 7). In this case the very severe reaction was probably due to the puncture of a small vein in the administration of the vaccine. It is a rather constant observation, however, that one of the three inoculations is followed by some reaction while the other two give rise only to a slight local reaction. In by far the greater proportion of cases it is the second dose that gives rise to this systemic reaction. This lack of correlation between the reactions and the agglutinins produced is in substantiation of the work of Craig[5], who showed not only that the general and local reactions after the triple vaccine did not exceed those after the unmixed or paratyphoid, but also that there was no direct relationship between these reactions and the amount of antibodies produced.

Craig's observations, not in agreement with the results of some English observers, that the agglutinin *titer for paratyphoid B was lower than those for the* two other organisms, are borne out in the majority *of the cases of this series, if they read in dilutions* direct. However, if the readings are made in agglutinin units, *the differences are so slight that a* much larger number of cases must be considered before any conclusions may be reached. Besides, the repression caused by previous vaccination must always be considered, and it is possible that prolonged previous exposure to minimal doses of organisms, with a production of a low-grade "natural" immunity might explain some of the wide variations in individuals, or the variations of the three agglutinins in the same, previously unvaccinated individual.

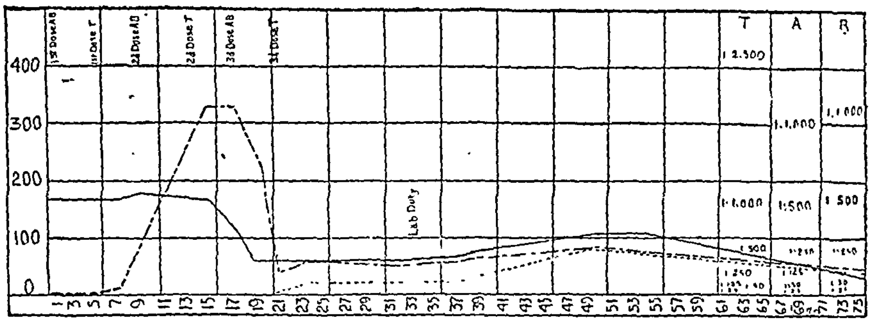

Chart 9.—Typhoid vaccination six weeks before Army vaccine. Army vaccine, July, 1917. Moderate reaction after second paratyphoid dose, and after second typhoid dose. Otherwise the reactions were negligible.

The pro-agglutinoid zone *ran a rather* consistent course. It *was, naturally,* not noticed, when agglutination took place in dilutions only so low as 1:25 or 1:50. *It* made its appearance, however, when agglutination took place in dilutions of 1:125 or 1:250. When this failure to agglutinate in lower dilutions, with very positive agglutination in the higher dilutions, once made its appearance, it ran a course consistently dependent on the dilutions, and not on any discoverable extraneous factor. A pro-agglutinoid zone ranging from dilutions of 1:25 to as high as 1:1,000 was frequently noticed during the time the agglutinins

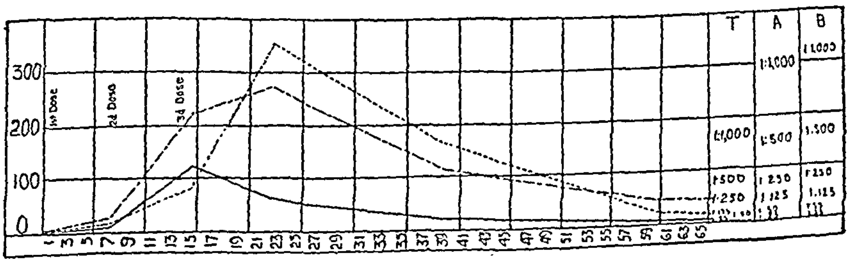

Chart 10.—Typhoid fever in 1896. Typhoid vaccine, 1915. Mixed commercial vaccine, 1916. First injection, headache, slight local reaction, highest temperature, 99.6. Second injection, headache and slight abdominal pain; *highest* temperature, 99. Third injection, slight headache, slight local reaction; highest temperature, 99.

---

5. Craig, C. F.: Triple Typhoid Vaccine (*Bacillus Typhosus*, B. Paratyphosus A. and B. Paratyphosus B), The Journal A. M. A., Sept. 22, 1917, p. 1000.

were at their height. It is important to keep the pro-agglutinoid zone in mind, lest through an insufficiently high dilution a tube in the pro-agglutinoid zone should be read as a wholly negative result.

While Zinsser, basing his opinion on the work of Bechtold[6] and that of Neisser and Friedman,[7] considers the assumption of pro-agglutinoids unnecessary, their existence would serve to make clearer some of the phenomena noticed. That the pro-agglutinoids not only completely inhibit the agglutination in the lower dilutions but partially inhibit it in the higher dilutions is possible. This supposition is borne out by the fact that when the titer of a serum comes down, the pro-agglutinoid zone precedes it, and with the total disappearance of this zone, a secondary rise on the agglutinin titer appears, which is difficult to account for in any other fashion.

CONCLUSIONS

1. Definite agglutinins for all three organisms are developed after the use of Army vaccine. They are equal after alternating doses and triple vaccine, the methods are equally effective, and the time-saving element in the latter is obvious.
2. Previous vaccination has the effect of repressing agglutinins for the specific organism.
3. Fluctuations in agglutinin content occur after vaccination, in normal cases, and are of little diagnostic value in cases of fever.
4. There is no relation between the systemic and the local reaction, after vaccination, and the units of agglutinins produced.

THE PSYCHONEUROTIC FACTOR IN THE IRRITABLE HEART OF SOLDIERS [*]

B. S. OPPENHEIMER, M.D.
Major, M. R. C., U. S. Army

AND

M. A. ROTHSCHILD, M.D.
Captain, M. R. C., U. S. Army

NEW YORK

In 1871, Da Costa published his observations "On the Irritable Heart" as seen among soldiers invalided for this malady during the Civil War. During the present war this condition has again become prominent and names such as "disordered action of the heart" (D. A. H.), "effort syndrome," "debility" and "neurocirculatory asthenia" are employed to describe the affection. The group includes all cases which present a well defined syndrome in which certain nervous and circulatory symptoms are associated with increased [illegible] fatigue and in which no definite pathologic condition can be found to which to ascribe the clinical symptoms. The underlying pathogenic process is still unknown; and when we speak of the psychoneurotic factor in the "irritable heart" of soldiers, we do not imply an immediate causal relationship between the two, or that the symptoms of the two originate in the same way, but rather that possibly both groups may result from some common but as yet unknown cause.

It is probable that at present under the term "irritable heart" are included types of cases which are fundamentally quite different. The prominence of the nervous system in many instances is so striking that one naturally considers the relationship to the psychoneuroses, just as the circulatory phenomena among certain cases of war psychoneurosis must have led neurologists to wonder where the dividing line is to be drawn; in truth, there is a borderline where the two dominions overlap. Some even believe the irritable heart represents merely the cardiac difficulties of soldiers suffering from war neuroses. Again, it was evident that a certain number of patients with irritable heart had suffered from symptoms of the condition long before enlisting, some dating the onset to the formative period or even to childhood. The question whether some cases were not congenital or even hereditary in character also occurred, particularly when dealing with soldiers who belonged to the group called constitutionally asthenic. Then there is the serious, and, in the American Army, immediate problem of dealing with recruits with such histories who break down in training.

With these matters in mind we decided to analyze the detailed histories of 100 unselected cases to see whether such an analysis would throw any light on these questions or give definite confirmation to certain impressions which had been gained in the course of daily routine observations. Our study was based on the clinical material in the large Military Heart Hospital at Colchester, which admits almost exclusively soldiers invalided from the British Expeditionary Force.

For purposes of comparison the same characteristics selected by Capt. Julian M. Wolfsohn[1] in his paper on "The Predisposing Factors of War Psychoneuroses" were utilized, and also the statistics on 100 wounded soldiers used by him as controls. We have taken the liberty of reprinting two of his tables, but have incorporated our observations in cases of irritable heart in a column between those he has published for the psychoneuroses and those for control soldiers. In both tables (1 and 2) it will be seen that the percentage of the various characteristics named are in general highest in the psychoneurotic group, intermediate in the irritable heart group, and lowest in the control group of cases.

FAMILY HISTORY

It must be made perfectly clear that we were investigating the family history of cases of irritable heart for factors considered causal for psychoneuroses. The patients were invalided for irritable heart only, and the statistics obtained from these are placed in the middle column in both Tables 1 and 2.

A positive family history of one or several of the characteristics selected was obtained in 56 per cent of cases of irritable heart and in 38 per cent. of the controls; but the contrast between the two classes becomes far more striking when certain of the individual items are compared. Thus with reference to nervousness in the family history, there are 45 per cent. among the irritable heart group and only 15 per cent. among the controls; in regard to insanity and epilepsy there are 23 and 15 per cent. respectively, in the families of cases of irritable heart and none among the controls.

[*] From the Military Heart Hospital, Colchester, England.

[*] This paper is abbreviated for publication in The Journal by the omission of Table 6, which is a long table of "Character of Service and Cause of Invaliding," arranged in groups, of each individual, with his age, civil occupation, period of total military service and of foreign service. Reprints of the complete paper may be obtained by writing to either of the authors.

[1] Wolfsohn, J. M.: The Predisposing Factors of War Psychoneuroses, The Journal A. M. A., Feb. 2, 1918, p. 303; Lancet, London, 1918, **1**, 177.

PERSONAL HISTORY

In Table 2, the contrast between cases of irritable heart and the controls is still greater. The total number or percentage of cases with a positive personal history is fifty-one among cases of irritable heart, twelve among the controls, and of those with positive family *and* personal history there are 46 per cent. among the former group and only 6 per cent. among the latter. As to the individual items, the predominance of certain characteristics among cases of irritable heart as contrasted with the controls should be especially noted, namely, presence of stigmata, prevalence of previous nervousness, a history of epilepsy or fits, of previous breakdowns, of moodiness, and of enuresis. It is well known that sufferers from irritable heart are apt to be teetotalers and are sexually not very active; the latter fact may account for the low percentage (18) of married men in this group as compared with 28 per cent among the controls and 42 per cent. among the psychoneurotics.

TABLE 1.—PERCENTAGE OF CHARACTERISTICS NAMED IN FAMILY HISTORY OF PATIENTS SUFFERING FROM (1) NEUROSIS, (2) "IRRITABLE HEART" OF SOLDIERS, AND (3) CONTROLS

	Neurosis Per Cent.	Irritable Heart Per Cent.	Controls (Wounded) Per Cent.
Nervousness	64	45	15
Alcoholism (parents and grandparents)	50	15	24
Teetotalers (parents and grandparents)	30	15*	16
Irritability of temper	36	27	12
Insanity	34	23	0
Epilepsy	30	15	0
Tuberculosis (immediate family)	12	13	4
Tuberculosis (relatives)	6	15	4
Stigmata	10	17	0
	—	—	—
Positive history for one or several of foregoing	74	56	38

* Figure incomplete.

TABLE 2.—PERCENTAGES OF CHARACTERISTICS NAMED IN THE PERSONAL HISTORY IN CASES OF (1) NEUROSIS, OF (2) "IRRITABLE HEART" OF SOLDIERS AND OF (3) CONTROLS (I. E., WOUNDED)

	Neurosis Per Cent.	Irritable Heart Per Cent.	Controls (Wounded) Per Cent.
Stigmata	34	12	4
Previous nervousness	66	46	12
Fears	50	31	8
Head injury	38	5	12
Epilepsy and "fits"	8*	5	0
Tobacco (excessive)	8	1	4
Alcohol (excessive)	6	0	16
Alcohol (teetotaler)	48	36	20
Married	42	18	28
Moody	55	27	8

Excessive religion	6	6	0
	—	—	—
Positive personal history	76	51	12
Positive family and personal history	70	46	6

* As stated in the text, the data in the neuroses and the controls are reprinted from Captain Wolfsohn's paper; in his figures, however, only epilepsy was considered, whereas we have also included "fits" which may, or may not, have been true epilepsy.

Of the 100 cases analyzed, sixty-one gave a positive family *or* personal history for psychoneurotic factors. Of these, forty-six gave a positive family *and* personal history, a group which we will call Group 1 to distinguish it from Group 2, which consists of thirty-nine cases with a negative family and personal history (Table 3). A comparison of other facts in these two large groups, 1 and 2, of cases of irritable heart is shown in Tables 4 and 5. As regards previous occupations in civil life, it is noteworthy that patients in Group 1 followed largely sedentary and light occupations, whereas of those in Group 2 some did light but more did heavy work. In Table 5 it is shown that the average duration of foreign service is six months less among Group 1 than in Group 2; but the real difference between the two types is seen in a comparison of the *character* of the military service rendered; only four out of forty-six in Group 1 did full duty, as contrasted with thirty-three out of thirty-nine in Group 2.

TABLE 3.—PERCENTAGES OF CASES OF IRRITABLE HEART OF SOLDIERS SHOWING POSITIVE FACTORS IN THE FAMILY OR PERSONAL HISTORY, PREDISPOSING TO PSYCHONEUROSIS

	Neurologic History		
	Family	Personal	Percentage
Group 1	+	+	46
Group 2	—	—	39
Group 1A	+	—	10
Group 1B	—	+	5

CHARACTER OF SERVICE

The character of service of each of the 100 men is also given in abstract in Table 6, and it is very evident that the patients in Group 1 from a military point of view gave such a poor account of themselves as a whole as to make one doubt whether it was worth the time and expense devoted to them. On the other hand, those in Group 2 certainly did at least the military duty of an average soldier, and many of *them* gave most valuable and prolonged service. *In such* patients, invalided for irritable heart, as *have neuropsychic* factors in their family and *personal anamnesis*, the value of the military service *rendered has been* found to be negligible (Table 6).

TABLE 4.—OCCUPATION

	Sedentary	Light	Heavy
Personal and family history positive (Group 1).	10	27	9
Personal and family history negative (Group 2)	2	17	20

THE CAUSES OF INVALIDING

The cause of invaliding is given for each of the 100 cases in Table 6, and it is worthy of note that among the cases in Group 1 there is frequently, in fact, in twenty out of forty-six cases, nothing definite; on the other hand, in Group 2 there is more frequently a definite precipitating cause, such as an infection like trench fever or dysentery, *prolonged service, gassing or shell explosion.*

TABLE 5.—AVERAGE AGE AND DURATION AND CHARACTER OF SERVICE

	Group 1 (46 cases)	Group 2 (39 cases)
Average age	27 years	25 years
Duration of foreign service	13 months	19 months
Number of patients that did full duty	4	33
Number of patients that had no foreign service	9	2

CONSTITUTIONAL PHYSICAL ASTHENIA

The sharp contrast between the two groups goes further than differences in their family and personal histories as regards neuropsychic factors, occupations in civil life, or duration and character of foreign service. A history of constitutional asthenia was obtained in almost 70 per cent. of Group 1 cases and in only 12.8 per cent. of Group 2.

By the rather vague term "constitutional asthenia,"[2] is meant a relative inferiority or an anomaly in the assemblage of inherent characteristics, both functional and morphologic, which go to make up the organism. Among the constitutionally asthenic we include those who have always been short of breath, have been unable to play the most strenuous games or keep up physically with the average of their fellows, have fainted or become dizzy easily, have blushed readily, perspired too profusely, and have suffered from cold extremities. There appear to be two types of such individuals, first, those who are weak and poorly built, or may have a "habitus," and second, those who to all appearances are muscular, strong and robust, and yet for some unknown cause have had symptoms such as dyspnea on exertion from youth up.

One may also include under this term patients who have a habitus, such as the narrow chested or splanchnoptoptic, those who have given evidence of a diathesis such as the hemorrhagic, the exudative, the lymphatic or the spasmophilic, and those having a dyscrasia, or belonging to certain types such as the vagotonic, angiospastic, erethic, feminine, eunuchoid, etc.; or those showing definite evidence of disturbance of the endocrine organs. Attention has been directed for many years to this whole question of constitution by F. Kraus, and it is impossible to enter into the subject here; but it must be emphasized that apart from neuropsychic factors, there is a constitutional tendency in certain individuals which predisposes them to the development of the irritable heart syndrome. Moreover, such a history of constitutional asthenia was present in 70 per cent. of Group 1 cases and in only 12.8 per cent. of Group 2. And it is this condition which is meant when the cause of invaliding in Table 6 is indicated as "nothing definite."

JUVENILE OR DEVELOPMENTAL VASONEUROTICS

From a study of the personal histories, it is believed that many patients with irritable heart of soldiers are the mature individuals who during their developmental period presented vasoneurotic symptoms. Of the forty-six patients in Group 1, thirty-two or 70 per cent. showed symptoms of constitutional physical asthenia before the age of 17. Of these, thirteen had symptoms as long as they could remember. Of the remaining nineteen, the age at which symptoms of constitutional weakness first manifested themselves ranged from 8 to 16, and averaged 11.8 years for those who could recall approximately their age when the symptom or symptoms appeared. (Two other patients date the appearance of their symptoms to their twenty-second and twenty-third year, respectively; but as the symptoms appeared so late, it is not certain they belong to the same group.)

Apparently hitherto no attention has been paid to a very important fact, that a syndrome identical with that of irritable heart occurs not infrequently in children,[3] especially associated with orthostatic albuminuria.[4] These symptoms usually arise in children at the school age, from 8 to 14, and are "chiefly those referable to the cardiovascular system, namely, dyspnea on exertion, palpitation, precordial pain, headache, fainting, hypersusceptibility to cold." To quote Bass and Wessler again:

> In spite of the absence of any demonstrable increase in the size of the heart, all of these children nevertheless had definite symptoms. . . . Twelve of the fifteen had definite signs of abnormal function, five had booming first sound, three had apical systolic murmurs; four had marked accentuation of the second pulmonic sound; four showed apical signs of marked overaction, and four showed increased heart dulness to the left.

In the illustrative case history that follows this description, they note "hands cold and cyanotic, marked dermographia, Chvostek's sign positive." Moreover, orthodiagraphic study of these cases showed that although the hearts do not dilate after exercise, a considerable number of them fail to become smaller under these conditions. In all these particulars, then, these cases formerly called "dilatative weakness,"[3] resemble the irritable heart.[5] In fact, the juvenile cases are identical in symptomatology with the syndrome as seen in soldiers. It seems highly probable to us, therefore, that the adult patients with irritable heart who give a previous history of similar symptoms at the prepuberty age, or as far back as they can recall, have been children who are recognized as suffering from "vasoneurosis," "dilatative weakness," etc. Indeed, we have been able to follow in civil practice one boy with a positive family history, whose symptoms began with cyclic vomiting in infancy and childhood, who had dyspnea, palpitation and occasionally pain on walking up-hill in his teens, and at 18 years of age presented the characteristic clinical picture of neurocirculatory asthenia with overacting heart, very diffuse apex beat, loud systolic murmur, etc.

DIFFERENCE IN SYMPTOMATOLOGY OF THE TWO GROUPS

In comparing the symptoms in the two groups of cases, that is, those with and those without psychoneurotic factors in their family and personal histories, it is noteworthy that in general, soldiers in Group 1 complain almost invariably of chest pain among other symptoms; (indeed, the men are apt to "stick it" until pain develops; then they become alarmed and report sick). Patients of Group 2 rarely complain of chest pain, but suffer more from exhaustion and weakness; they are "done up," to use their own expression. One case may be cited belonging to Group 2 which illustrates that an acute infection may be the cause of the irritable heart, that these symptoms may then disappear and leave simply exhaustion. The patient referred to broke down after prolonged service and trench fever with breathlessness which disappeared after a fortnight, leaving him with weakness, exhaustion and nervousness, but no dyspnea or pain. The post-infectious cases of "irritable heart" are more apt to prevent exhaustion symptoms and only exceptionally pectoral pain.

There is perhaps a certain parallelism between these two groups of "irritable heart," and cases of war neuroses. If we understood Captain Rivers correctly, certain cases of shell shock result in repression neurosis, the *anxiety* neurosis, while those resulting from exhaustion or infection manifest themselves as *exhaustion* neurosis (neurasthenia). Similarly in a general way, among patients with irritable heart there are those belonging to the constitutional group, who suffer from chest pain, etc., and those who belong to the exhaustion or the postinfectious group who have fatigue symptoms, but rarely much pain.

---

[2] In the British Army "constitutional" means merely "pre-enlistment"; a condition is termed constitutional if it existed before enlistment.

[5] We examined thirty unselected cases of "irritable heart" and found one with orthostatic albuminuria. Orthostatic albuminuria usually disappears at puberty, but may remain in adult life. We have observed Chvostek's sign repeatedly among soldiers suffering from irritable heart.

SUMMARY

As stated at the outset, we do not know the fundamental pathology of the syndrome known as the "irritable heart" of soldiers. It is almost certainly not a clinical entity. In general, there are two large groups of cases whether investigated from the standpoint of neuropsychic factors in the family and previous history, or from that of preenlistment and constitutional symptoms. In half the cases one observes, there is a positive family and previous history of factors considered predisposing to psychoneuroses, and in almost 70 per cent. of these there is a history of constitutional asthenia. It is this particular group (1) that inclines one to the view that an irritable weakness of the whole nervous system, including the innervation of the entire circulatory system, may account for the varying neuropsychosomatic symptoms.

There are all the remaining cases to be considered, however. It may well be that the resistance of individuals in Group 2 was perfectly normal, but that they were subjected to a strain or infection, sufficiently prolonged or intense to exhaust their reserve. The normal individuals, when they do break down, seem to present symptoms of exhaustion; the relatively inferior individuals show both excitation and exhaustion.

The burden to the Army of cases of irritable heart may be lightened by the early recognition of cases belonging to Group 1. As yet we do not know how many individuals having similar family and previous histories for neuropsychic factors (with or without preenlistment symptoms) give valuable military service and are not invalided. Until such statistics are available, it is practicable to recommend that only special boards be guided in the disposition of recruits by such anamnestic data.

In a type case of Group 1, the patient has a positive family and personal history for neuropsychic factors: in civil life followed a sedentary or light employment, tolerated about one year of foreign service, but that usually at light duty. He is apt to break down finally, not from a definite precipitating cause, but because he is fundamentally relatively inferior. He almost invariably complains of chest pain among his other symptoms.

In a type case of Group 2, the patient has a negative family and personal history, in civil life followed some occupation involving hard labor, stood about one and one-half years of foreign service, and that usually at full duty. He is more apt to give a history of a definite precipitating cause, such as prolonged service or acute infection, which invalided him. He complains more of exhaustion and weakness, and only rarely of chest pain.

Individuals of Group 1 who were invalided gave a history indicating that the value of their military service was almost negligible, while before breaking down many of those in Group 2 gave unquestionably valuable service.

PROPHYLACTIC TREATMENT IN THE PREVENTION OF VENEREAL DISEASE

MORRIS C. THRUSH, Ph.G., Ph.M., M.D.
(Philadelphia)
Captain, M. R. C., U. S. Army
CAMP DIX, WRIGHTSTOWN, N. J.

During the past couple of decades, the trend of medicine has been steadily and progressively toward preventive rather than curative medicine. In no domain of medical science has this principle been more strongly exemplified than in the sanitary measures that are being utilized to protect the health of the soldier in the United States Army. For a long time the great bane of all armies has been the venereal problem, and the same applies to navies. The United States government, realizing the great necessity of curbing this evil, has adopted certain regulations which have been of the greatest service. These regulations are four in number:

1. General orders concerning venereal diseases, requiring men who expose themselves to the danger of contracting venereal diseases to report at once for prophylactic treatment on return to the camp; with trial by court martial for neglect of duty, for any soldier who fails to comply with such instructions, and loss of pay while absent on account of sickness.
2. Thorough physical inspection of all the enlisted men of each organization, twice in each month, by a medical officer accompanied by the company or detachment commander.
3. Abolition of alcohol from the Army.
4. Establishment of "vice zones" around military camps, forts and cantonments.

APPLICATION OF THE REGULATIONS

The object of this article is to show what can be obtained by the judicious application of the foregoing regulations in the individual regiment or smaller organization, which is the working unit in the Army. I know of no better way to illustrate the efficiency of these procedures than to cite my experiences as regimental surgeon in the Three Hundred and Fiftieth Field Artillery, Ninety-Second Division, National Army, located at Camp Dix, N. J.

The Ninety-Second Division is composed entirely of colored troops, and our regiment is made up of drafted men from the state of New Jersey. From the formation of this regiment, Nov. 8, 1917, to April 19, 1918, only nineteen cases of venereal disease have developed which did not exist prior to draft. Of these, twelve men did not apply for or receive prophylactic treatment. These men were all tried by Summary Court under General Order 45, and appropriately punished under military regulations. During this time 1,561 prophylactic treatments were given, and only seven men thus treated contracted venereal disease. Of the seven who contracted venereal disease notwithstanding prophylactic treatment, all were cases of over twenty-four hours' duration. Five were gonorrhea, one chancroid, and one syphilis. This shows the efficiency of prophylactic treatment; it also demonstrates the value of early treatment whenever possible, as four out of the seven cases developed during the Christmas and New Year's vacations, when the men had four and one-half days' leave, and all four of these admitted relations on the first day of leave, making an interval of four days before receiving prophylactic treatment. This leaves only three cases that developed after prophylactic treatment when the interval was between twenty-four and forty-eight hours, and not a single case in which prophylactic treatment had been administered within twenty-four hours after exposure. Remembering that 1,561 prophylactic treatments had been given during this time, we can only wonder how many cases would have resulted without this treatment. The number of prophylactic treatments, it may be explained, would have been far greater had not the camp been under quarantine over five weeks of this period, and during this time no leave was granted. This represents an average of over 100 treatments each week-end, since receiving the great bulk of our troops. We have had as high as 150 treatments between Sunday night at 10 p. m. and reveille the following morning.

THE TYPE OF SOLDIER

These men were all raw recruits drafted into the National Army, and the majority had held such positions as butlers, chauffeurs, farm helpers, cooks, waiters, bell-boys, and a large number as laborers in mills, shops and factories.

About 20 per cent. had only a limited knowledge of reading and writing; a few, about 3 per cent., were completely illiterate. About 5 per cent. had completed a grammar school or higher education, leaving about 72 per cent. who had an equivalent of from two to six grades in a grammar school course. It was surprising to note how rapidly these men accepted and carried out disciplinary measures. They are in every way equal to their white brethren. The venereal report given above and the weekly health report will certainly confirm this fact.

Quoting from the weekly telegraphic report for the past four weeks, we note that:

Three weeks ago, the percentage of sick was 0.8.
Two weeks ago, the percentage of sick was 0.9.
One week ago, the percentage of sick was 0.6.
April 19, 1918, the percentage of sick was 0.53.

Quoting from the report of the division sanitary inspector to the division surgeon, under date of April 17, 1918, we note that:

Three Hundred and Fiftieth Field Artillery, the noneffective rate per thousand was 15.7.

Camp Dix, N. J., the noneffective rate per thousand was 43.0.

Thus it will be seen that our sick rate is one-third the average camp rate; and in addition this is the lowest rate of any regiment in the camp.

This also shows that the colored soldier obeys orders, as no such results could be obtained if sanitary regulations were not obeyed. The comparison with other groups is just, since the various organizations live and train under the same conditions.

Sixteen per cent. of the enlisted men had venereal disease on admission, divided thus: 83 per cent., gonorrhea; 7 per cent., chancroid; 10 per cent., syphilis.

METHOD OF OBTAINING RESULTS

The official reports have quite regularly employed the designation, *Very Satisfactory.* Now, how have these results been obtained?

1. By harmonious cooperation and concerted action between the line and the medical officers on all important subjects pertaining to sanitation and the general health of the men. This can be accomplished only when proper *esprit* exists between officers working together for a common cause.

2. By frequent lectures to the men, in which the medical or line officer explains in plain, understandable English the reason for every order or request bearing on this subject, at the time it is made; and at the same time convincing the men that that particular order or request is solely for their own benefit or protection, the disobeying of which would mean physical suffering as well as military punishment.

3. By encouraging the men in all forms of athletics, music and entertainments of various kinds, and in the reading of useful books on military or other interesting subjects.

4. By securing the implicit confidence of the men in their officers as their leaders to such a degree that when an order is given, it is instantly and willingly obeyed at all times and under all conditions.

New and Nonofficial Remedies

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION. W. A. PUCKNER, SECRETARY.

ANTIPNEUMOCOCCUS SERUM.—See THE JOURNAL, June 1, 1918, p. 1599.

Cutter Laboratory, Berkeley, Calif.

Anti-Pneumococcic Serum, Type I.—Marketed in vials containing 50 Cc.

H. K. Mulford Co., Philadelphia.

Antipneumococcic Serum, Type I.—Marketed in double ended vials containing 50 Cc.

Antipneumococcic Serum, Polyvalent.—Prepared by immunizing horses with dead and living pneumococci of the three fixed types (Types I, II, III).

Marketed in double ended vials containing 50 Cc. each, with sterile needle and tubing for intravenous injection.

Dried Milk in Infant Feeding.—In Great Britain the local government board has issued a report on dried milk in infant feeding as the result of an inquiry carried out by Dr. F. J. H. Coutts, medical inspector of the board, and by Dr. George Winfield, who was commissioned to investigate the nutritive value of dried milk in infant feeding and its bearing on certain disturbances of nutrition. Two methods of preparing dried milk are the process of passing the milk over heated cylinders and scraping off the film thus formed, and the process of spraying a previously concentrated milk into a hot air chamber where the dried milk falls in the form of a cream colored powder. If kept dry, this powder will remain fresh for weeks or months, and when mixed with water in the proportion of 1 dram to 1 ounce, it corresponds in composition to ordinary milk. Its disadvantages are that it has a somewhat boiled taste, the fat rises quickly to the surface and there is generally some undissolved residue. It has proved, however, to be a good substitute for cow's milk, being much better than the proprietary foods, which contain much starch. The dried milk is said to contain far fewer germs than ordinary town milk and is less likely to transmit infectious diseases. Germs do not multiply in dried milk. It should be prepared only as needed for feeding, since it does not keep well.

RECONSTRUCTION AND REHABILITATION OF DISABLED SOLDIERS

REPORT OF THE FIRST MEETING OF THE SECTION ON MISCELLANEOUS TOPICS HELD IN THE AUDITORIUM THEATER, THURSDAY, JUNE 13*

The meeting was called to order by the chairman, Col. Frank Billings, Chicago, at about 9 o'clock.

The chairman said: You are here this morning because you are interested in our soldiers, the flower of American manhood, who have gone overseas to bear their breasts for you and me against the monsters on the other side; and you feel, as the whole country feels, that we must do something for those boys who are giving their all to the country should they become disabled in this war and do something for the—we call it the physical reconstruction of the men who are disabled; but that is not a very sympathetic word. What we mean is, that we want to make them well again, we want to cure them if we can, and we want to restore them to civil life that they may take their places in economic life again as capable of earning a living wage or salary as they were before, and to also enjoy life as we want them to enjoy it, because they certainly have earned it.

We have a man at the head of the Medical Department of the Army whom you all know. You know him because of his eminence in medicine, and particularly in sanitation. It is not necessary for me to repeat to you what he has done, because the world knows it. But you of the world at large do not know him as some of the rest of us do, because big as he is mentally, much as he has done for the world in sanitation, his heart is just as big as his scientific attainments; and he has conceived this idea of the restoration of our boys. When I tell you of the policy that he has announced, how he struggled to have that approved by the Secretary of War, and finally succeeded, you will understand that that policy is that no soldiers disabled in the line of duty shall be discharged from the Army until cured, or as nearly cured as their disabilities permit. We are fortunate in having the Surgeon-General with us to tell you at the beginning his opinion of physical reconstruction—General Gorgas.

Opening Address by Surgeon-General William C. Gorgas

Surgeon-General Gorgas said: The question of reconstruction of the phase that you hear outlined here today is entirely new to our Army; it is a new phase of military life particularly in this war. Originally in all armies the whole question was that of defeating the enemy; everything that tended in that direction was fostered, and those things that had no direct bearing on that were left uncared for. Three hundred years ago, for instance, the wounded man was of no particular use with regard to the defeat of the enemy. He was a drag on the Army, and no attention was given to him. Gradually there has been evolved more humanitarian motives, and the Army authorities have been able to care for the wounded not with the idea so much of increasing their military efficiency but with the humanitarian idea of looking after the wounded man.

I have no doubt that if it were necessary for the defeat of the enemy our soldiers and people would still be willing to do what our ancestors of two or three hundred years ago had to do, that is, to sacrifice the wounded. That has been the case both in the European armies and in the more savage armies, like the Zulu army, which were as efficient military machines as any we have ever known.

The great function of the Medical Department so far as the wounded is concerned is in getting them back to the Army. This department will have in the reconstruction nothing to do with the men that are to be discharged. By examining the statistics of the Canadian army we get a pretty good idea of what we are going to have to do. They have sent over some 350,000 men; they have been at war now about four years. Of the men sent across they brought back about 10 per cent. for this reconstruction work. We calculate that our proportion will be about the same.

This reconstruction work is a greater departure from the military objective of the Army than has occurred in the past with regard to medical activities. We are not taking care of these men for the actual efficiency of the Army in the field; we are doing it from a humanitarian principle of making the men more useful, more happy, and achieving a better result both for the men themselves and for the community in making them useful and happy members of that community when they have returned to civil life. Heretofore most of the activities of the Medical Department of the Army have tended toward the direct efficiency of the Army.

Chairman's Address—The National Program for the Reconstruction and Rehabilitation of Disabled Soldiers

I shall attempt to tell you as briefly as possible of the national program for the physical reconstruction of our disabled soldiers. The national program would not be complete if it did not consider the soldier from the time he receives his disability in the field or through illness in hospital, until he is placed back in civil life. Recently Congress has enacted a law which places the disabled soldier after his discharge from the Army within the authority and jurisdiction of the federal Board for Vocational Education. The federal Board for Vocational Education has representatives on it of three cabinets. It is composed of men qualified to carry on their part of the work. Congress has given them power and jurisdiction over the man and money to do their work. They are enabled to cooperate with those federal departments which may best help them. They have the power to go out in the country and to secure the employment of men and women who are best qualified, unrestricted as to salary, in their work; therefore, that part of the work of the care and reeducation of the man after he shall have left the hands of the Surgeon-General until he is placed back in his employment in civil life is complete. I have no doubt that the qualification of that board will make that part of the work efficient. That is the smaller problem of the whole program. To the Surgeon-General is left the harder task, because he has jurisdiction over the man when injured or ill and has the care of him while he remains in the Army until he shall have been cured. He has the jurisdiction over him, the responsibility overseas and in our cantonments or training camps everywhere, in our hospitals generally after he reaches them until he is discharged; and his program, while understood, has not yet been granted all of the machinery to carry it out; but we do not doubt that with the morale back of us in this country represented by you and by the forces that he can command of the best in medicine and surgery in this country, he will be able to do his part quite as efficiently as the federal Board for Vocational Education.

Let me tell you a word of what the physical reconstruction under the Surgeon-General must mean. First of all, it means organization overseas and in our camps, that the men who have been disabled through illness or injury shall receive early and prompt attention looking toward their physical reconstruction; that the man who has lost a member, or his eyesight, or his hearing, or who is tuberculous, or whose heart has given out, should not be allowed to remain neglected and unattended to until he feels discouraged because of his disabilities. He must be dealt with promptly. He must be brought back to this country if abroad and he must receive early attention in order that his disability may be efficiently treated.

That part of the program has been taken up and is already organized, although not as completely as it will be. The man is treated in the general military hospitals; the soldier is under military care. The Surgeon-General has no power to treat him excepting in military hospitals. He is cared for by military forces, and not by civilians. The Surgeon-General may bring into the service civilians, and he will welcome civilian help; but those who deal directly with disabled soldiers are officers in the military service. The hospitals are general hospitals. The general hospital in the Army is much like our general hospital in civil life. It is a compound special hospital where all departments of medicine and surgery are recognized. So far the hospitals in this country utilized have been existing general hospitals. You hear of "reconstruction hospitals." Military hospitals general in character may carry on reconstruction.

The general hospitals so far used are not new; most of them have been in existence a long time. A few hotels were

the Sixty-Ninth Annual Session of the American Medical Asso-

509

Park Ave

taken over at the beginning of the war, because of the need of buildings, and are rented institutions. There is one at Lakewood and one at Cape May. There is one new hospital at Colonia, near Trenton, N. J., which will function chiefly as a reconstruction hospital. As the work goes on and the number of soldiers to be reconstructed increases, other hospitals will be built which will probably function as reconstruction hospitals. These hospitals will be so located as to bring the soldier nearest to his home. The question is asked frequently, Will these be state institutions? That cannot be answered. If we could have ideal conditions, each state would have a general hospital that would function in the physical reconstruction of soldiers; but it is too early to speak of that. Possibly the states could cooperate with the government to secure hospitals that could be used for physical reconstruction during the war, and if the states would cooperate in helping the government to finance them, these could be made permanent structures. But in all probability general hospitals that will be used for physical reconstruction will be constructed hereafter and will be located in the military districts of the country, of which there are sixteen.

Hospitals for physical reconstruction will differ in some degree from the hospitals that are used in civil life or for general purposes, in that not only will they provide the necessary personnel, medical and surgical, with the necessary operating rooms, laboratories and all that goes to the makeup of the modern hospital, but also they will have physiotherapeutic departments. By physiotherapeutic I mean measures physical in character used in the treatment of the sick, such as hydrotherapy, electrotherapy, active exercise in the form of drills, Swedish movements, outdoor games and massage or passive exercise. These will be employed and standardized to apply to disabled soldiers, no matter under what department of medicine or surgery they may fall. In addition to these physical agencies in modern medicine, we recognize another curative measure in the form of work—curative employment, if you please. This has been utilized in the civil hospitals to a degree dependent on the character of the community in which the hospital was situated, and has usually been called ward work. It has consisted frequently of work not so purposeful in its character, but rather as diversional in character, in the form of knitting, in the form of basket weaving, etc. But work which the Surgeon-General utilizes as curative in character in the general hospital for these soldiers is more purposeful than knitting, basket weaving and the like. In other words, it is of the kind and character of curative work that will look toward the training of the soldier for employment after his discharge from the Army. Or, in other words, it will be prevocational or even vocational in character. The discharged soldier will fall within the jurisdiction of the federal Advisory Board for Vocational Education, whose work is well cut out and is not entirely separate from that of the War Department; for this board, under the law, may act in an advisory capacity with the Surgeons-General of the Army and of the Navy in this work. In the same way the War Department and the Navy Department may act in an advisory capacity with the federal board after the soldier's discharge. In the event that he becomes ill after his discharge he may probably be brought back into the Army for further treatment. In choosing the curative work for the soldier, the advisory board can be of great use to the War Department in selecting the character of prevocational curative work which will be assigned to the soldier in the ward and in the workshop. To do this work under the Surgeon-General there is no difficulty in securing the personnel, medical and surgical, that he has at his command. He has choice of the best qualified medical men and women of the country to do the work, not only in camp and field, but also in the physical reconstruction of these soldiers. We know that they will do their work well. There is a misconception on the part of some physicians about what their duty will be with respect to physical reconstruction. I have had many interviews and have received many applications from them saying, "I want to come in and do physical reconstruction because I am interested in it, and have worked at it some in civil life." The medical man and the surgeon will function exactly in the physical reconstruction of the soldier as he does in the treatment of the man that does not need physical reconstruction. In some respects he will have to acquire some new lines of thought looking toward the restoration of function, but in which he has the cooperative influence of others, namely, the physiotherapeutists and the educational officers. Dr. Tate MacKenzie, a Canadian, has been invited by the Surgeon-General to take charge of the department of physiotherapy to standardize the work and to secure the proper personnel in physiotherapy that will enable us to do that work well.

The Surgeon-General has secured as the head of the Educational Department for Physical Reconstruction Mr. James E. Russell, dean of the Teachers College of Columbia University, New York, a man well known as an educator. He will organize a personnel of general and technical educators to work in the hospitals to advise with the doctors, the representatives of the federal Board for Vocational Education, and with the man himself as to the character of his prevocational or curative work.

We have already done a lot of work in spite of the fact that the government has not until now supported this program by the necessary legislation. The Surgeon-General has started the work in eleven hospitals, and in seven of them has the complete organization that I have named. The men from overseas, the men from our camps, are under treatment for physical reconstruction. Some of them have already been discharged, placed back in civil life and employed in new and gainful occupations for which they were trained while patients in the Army hospitals.

[Lantern slides illustrative of the work were presented and described by Colonel Billings.]

Reconstruction and Rehabilitation Problems as Solved in Foreign Countries

Lieut.-Col. Casey A. Wood, M. C., N. A., said:

During the first year of the great conflict practically all the warring nations began to do something for their disabled men in the way of rehabilitation. At first, these efforts were confined to combatants who had lost an arm or a leg, to those whose disablement was most evident; but gradually the tuberculous, the blind, the rheumatic, the nervous cases, and others who were unable for various reasons to return to the fighting line also were included. At present we find successful schemes, especially in Belgium, France, Great Britain, and Italy, as well as in the Teutonic countries, for the care of all these types of military incapacity through disablement. It is, however, to Canada that we must look for those experiences that are most likely to help us when we are confronted with problems of detail respecting the physical and vocational restoration of the disabled soldier and sailor. For example, the Canadian authorities were the first of all the belligerents to consider the responsibility to the disabled soldier a national one. They were the first to announce that it is the duty of the state to reeducate at the expense of the state those who had been crippled in their country's service.

From the standpoint of the experiences of all the belligerent countries, as Colonel Billings has pointed out, it was early recognized, although for a long time little was done to relieve the situation, that almost from the hour of a serious injury, especially one involving the probable loss of a member or an organ essential to the soldier's happiness and civil vocation, the crippled one began to regard himself as a hopeless invalid. Continued brooding over this belief at length induced a state of mind fatal to rehabilitation. It was no uncommon thing for the soldier to pass through even half a dozen hospitals before he reached what may be termed a reconstruction center—made it almost impossible of eradication. Such a mental attitude, born of the feeling that everybody avoids and will avoid a cripple, was eventually combated in most foreign countries—we have not yet thought of doing it in our own—by what is known as a "cheer-up" program. Not only were the medical officials and nurses attached to base and other hospitals instructed to encourage the disabled soldier on all proper occasions by telling him the good news of the rehabilitation program, but judicious, sane members of officially appointed "care committees," and other social service activities were appointed to visit the bedridden patient, as soon as that could properly be done, and kindly but firmly—a good deal of emphasis in some countries is placed on the "firmly"—preach the gospel of civil reestablishment. Now in most hospitals abroad the good work done by "cheer-up" officials is supplemented by motion pictures, by books on the subject of reconstruction, and even by short talks in hospitals telling what the disabled man may accomplish by the exercise of a little patience and perseverance. As soon as the disabled can profit by them, appeals are made to his patriotism, to his self-interest, to his domestic relations as a means of preparation for his subsequent return to the duties and pleasures of citizenship. From this time on preaching the doctrine "there are no more cripples" has been found by all foreign countries engaged in this work of salvation to be helpful—indeed, essential—to the successful establishment of the disabled in their former civil life surroundings.

It is the consensus of reconstruction opinion abroad, also, that the ideal rehabilitation program demands the continuous, and as far as possible, uninterrupted care and education of the disabled soldier. From the first days of his disablement until his placement once more in private life as a contented, wage-earning citizen, education and reeducation should go on. The task is much easier for doctors, for nurses, for vocational trainers, for placement agencies and the so-called advisory and follow-up services—not to mention the effect on the man himself—when he is surrounded by what may be termed a reconstruction atmosphere. Hence it follows that furloughs and leaves of absence should be as short as possible, and interruptions in his studies as limited as may be. Moreover, the training of these returned heroes is an intensive one. Most of the courses must possibly be limited to six months.

If the attempt on our part to salvage disabled soldiers and sailors is to be successful, it is necessary that at least three classes in the community should be carefully taught the principles of physical and vocational reconstruction. I do not say the details, I say the principles. The first class comprises medical officers, nurses, vocational teachers, and other officials whose duty brings them into close contact with the sufferer. The second class is composed of the soldiers themselves, and the third class is made up of the great mass of the public. Of the third class it may be said that every foreign nation has discovered that the labor of both physical and vocational reconstruction of the invalided soldier is greatly lessened when the soldier's own people—his parents, his wife, his sister, his brother and associates generally—possess a full knowledge of the purposes and processes of rehabilitation. When this is accomplished the returned soldier soon discovers that, although he is a hero, he is expected, for his own sake, for the sake of his country, for the sake of his family, to reestablish himself as a normal, independent, self-respecting citizen, capable of earning a living and asking favors from no man.

In England, in France, in Canada and in the United States, magazines are published on this subject, and all the usual forms of public instruction are invoked to carry forth this message of hope and salvation to every family in the land. When the time comes, as unhappily it must, that some loved one requires the offices of physical, mental or vocational reconstruction, it will surely be a consolation to all concerned to know just how and when this great work will be done. As one having, under the Surgeon-General, this particular duty of publicity, it is not improper for me to say that there will be distributed to this audience, after each meeting, copies of our new magazine, *Carry On*, together with literature for further distribution that presents briefly the main features of reconstruction.

The Surgeon-General's Plans for the Receiving, Transporting and Distributing of the Disabled From Overseas

Brig.-Gen. Robert E. Noble, M. C., N. A., Staff of the Surgeon-General, said:

The question of returning soldiers from overseas to the hospitals in the United States is largely a question of transportation. Being a medical man, I of course have no hesitancy in attacking that problem. The transportation means not only the return but the proper distribution and segregation of these patients after they arrive in the United States. We have devised plans by which the men will be classified according to wounds, sickness or disability, in France. They will be returned to the United States by hospital ships or other transportation provided, and on that ship all papers in connection with those men will be absolutely complete. We shall have traveling medical officers go from this country to Europe and return in order that these papers will be in such shape that when the men arrive in the United States we can handle them very much as they would a boatload of emigrants returning. The men will be tagged according to their injuries, so that we can separate them at once on arrival here, and can then send them by train to the hospital that has been selected for them. The commanding officer at the port of importation will be furnished with a list of the hospitals and the number of beds at each and the character of cases to be sent to each particular hospital. We shall have at these places an officer who is especially trained in matters of transportation, who will arrange a schedule for the trains and special coaches for the various passenger trains. On the hospital trains in this country there will be every comfort and convenience for the care of the sick and disabled. We shall have several types of coaches, we shall have kitchen cars, dining cars, ward cars, and what we call unit cars, for the staff. The unit cars will contain not only the staff but one or two medical officers, two or three nurses, or such number as may be necessary. That can be attached to a train and carried to any part of the country distinct from an entire hospital train. These unit cars will be so that we can send half a dozen or a dozen sick from any one place in the country, or send a trainload. Then these cars will be returned to the port of importation and used again.

The hospitals to which we shall send them will be scattered throughout the United States. We intend to follow a zone hospital system plan, that is, we shall return to the various draft zones the men from each zone. We shall have in this country enough beds to take care of any sick or wounded that may be returned from abroad.

It is not the purpose of the War Department to return to the United States men who will in a short time be again returned to the firing line. I think that that period has arbitrarily been fixed at six months. If, however, we find that a man is in such condition that he cannot be returned to the firing line, he will be brought back to the United States at the earliest possible moment.

The hospitals are of the pavilion type; they will be reconstruction hospitals in one sense of the word and in another sense they will be general hospitals. We shall at first send any class of cases to the hospitals until the reconstruction work of the hospital predominates; then we shall send a constantly diminishing number of general cases to that hospital until it becomes purely and simply a reconstruction hospital.

Acute Surgery as Related to Reconstruction

Lieut.-Col. M. G. Seelig, M. C., N. A., said:

In discussing the relationship between acute surgery and reconstruction, we shall consider only that phase of reconstruction which concerns itself with physical rehabilitation. In defining the phrase "acute surgery," one must at the outset guard against the assumption that acute surgery applies only to the exigencies dependent on war traumas. Such reasoning would cripple our Army by false logic. The Army surgeon must regard acute surgery as embracing those surgical diseases of an acute nature, and those traumas occurring in the general, cantonment, post, base and other military hospitals at home, as well as projectile wounds and acute surgical diseases occurring "over there."

The Army surgeon who assumes the responsibility of operative procedure on a patient also necessarily assumes the responsibility of returning that patient to duty status or to civil life, so completely cured that he can have no valid claim as a pensioner. Our responsibility is keenly emphasized, almost beyond the power of any man ever to be unmindful of it, by the recent ruling of the Judge Advocate-General which very properly makes it obligatory on the soldier either to submit to surgical therapy, if a properly constituted medical board decides that such therapy is necessary to enable the soldier to perform his military duties, or to face a court martial.

This type of responsibility carries with it, in addition to an intensified zeal to save life, a markedly heightened effort to restore the sick soldier to his status quo ante. He must be made fit for soldiering again at the earliest possible opportunity, or happily, as we look forward to victory, he must be rendered fit to reenter civil life fully able to carry on and do his bit without claiming any of the government aid that a grateful country stands ready to grant her incapacitated soldiers.

In essence, then, the Army surgeon practicing acute surgery finds himself face to face with the problem of reconstruction in such fashion that his set task is to do away as far as possible with the necessity of later so-called reconstructive work. This task, one which the civil surgeon is trained to meet, is fairly simple as applied to surgery performed on home territory. In the zone of advance, and also, though possibly to a less degree, in the lines of communication, the problem is seriously difficult and gravely pressing. The haste of battle, the exigencies of terrain and transport, the necessary improvizations of warfare, and other factors too numerous to detail, all exercise their influence on the mind and judgment of the surgeon.

And yet if his work is to carry the hall mark of "well done," it must always be done with the thought in mind of restoring the patient at the earliest possible moment with the least possible requirement of secondary so-called reconstructive surgery.

Naturally it is not necessary to emphasize that in acute war surgery, just as in acute civil surgery, our first and foremost duty is the conservation of life; nor should it be necessary to emphasize the fact that even the press of battle does not mitigate by jot or tittle the baneful effects of unnecessary operation.

It seems beyond question or doubt that late epilepsy and apoplexy, the aphasias, psychoses and other mental disturbances, bear a definite relationship to the type of front line surgery performed for cranial injuries; the early surgery done for the relief of spinal injuries is of itself one factor in the course of later paralyses, spasticities, bed sores and disturbed bladder and rectal functions. On the quality of judgment displayed in the first line to base hospital treatment of nerve wounds depends in no small measure the amount of later surgical effort necessary to correct overstretched muscles, contractures, ankyloses, and loss or disturbance of sensation and motion. Wounds of the lung may result in comparatively trivial bronchitides and chronic pleurisy or in permanent disabling lung collapse and distressing fistulas, dependent on the type of early surgical treatment. Acute surgery is related to reconstructive surgery. The relationship is maintained solely through efforts directed toward minimizing the quantity of reconstructive surgical effort necessary.

Reconstruction in her turn owes certain duties to surgery. Reconstructive surgery resolves itself finally into the fundamental idea of complete surgery directed toward the restoration of complete function. The antithesis to complete surgery is interrupted surgery. Let us recognize at the very outset the two horns of the dilemma from which later we may be prepared to see both surgery and reconstruction suspended; surgery transfixed by the idea of incompleteness and reconstruction pierced by the fatal idea of beginning only where surgery leaves off. For myself I know but one type of my own specialty of general surgery, I know but one type of orthopedic surgery, or of neurologic, otologic or ophthalmologic surgery. They are all reconstructive.

DISCUSSION

Sir Arbuthnot Lane, London, England, said:

When this war commenced we were fortunate enough to be able to call to our help perhaps the greatest medical organizer that we ever had—Lieut.-Gen. Sir Alfred Keogh. He had already dealt with our medical problems and had solved them in a most remarkable degree. He had been almost all over the world. Criticism could not feeze him, he was met by an outcry because they said he called for too many men, they said he was employing men unnecessarily, but he was obliged to do so. There was at that time a great threatened uprising in India; the public did not know about it, it was kept secret, nobody knew of it at the time. Our medical men rushed in to the help of the country, they gave up everything without a thought of their future. The only qualification that Sir Alfred Keogh insisted on in those men was youth. It was no use to send men past middle age. As time went on, he realized there were two main factors that we had to consider in dealing with men. One was efficiency and the other personnel. In other words, the application of those two principles, specialized function and fixed tenure with the minimum personnel. Finally, under the lead of Sir Alfred Keogh, things began to take shape and we made two great subdivisions, one purely medical and the other surgical. In that way we were able to specialize and establish some fixity of tenure and accomplish the most with the minimum of personnel. We began by collecting these poor fellows who came back from the front with their faces burned and defaced by shot and shell or by flaming fire thrown on them, poor fellows hideously disfigured. The difficulties that we experienced in handling those men in the hospitals arose from the fact that they were unlike ordinarily wounded men. The wounded man of former times who had lost an arm or a leg was received by his family with sympathy and affection and his children hung around him; but these men were so deformed and disfigured that they were disagreeable to contemplate. A man that comes to you with no mouth, no jaw, no eyes, and a cavity where his nose ought to be, is regarded by his wife and children with ill concealed aversion and horror. His loved ones cannot identify him as the object of their affection and regard; they can see no trace of his original features. It was such patients that we had to deal with, and we had to deal with them in enormous numbers. We found men who were willing to devote themselves to this particular labor of love, and the work called for the very best of their skill and attention, They gradually improved those patients in a most remarkable way. But we found that it was a difficult thing to do this in a large hospital, they were a source of distress not only to themselves but to the people about them; so with the assistance of the British Red Cross, which has done invaluable work in this way, we got a large and beautiful domain in Kent, in the very heart of the country, and there we cared for the men where they were secluded from the public gaze. They are only 12½ miles from the great center, London, and are under the care of the greatest plastic and dental surgeons that we possess. Very soon we had there in that particular hospital British, Australians, New Zealanders, Canadians, both officers and men, all working together in the most friendly manner, competing and vying with each other to produce the best possible results for those poor unfortunate creatures.

Surgeon-General Bradley in France has been good enough to send us twelve American surgeons. I need not tell you how delighted our men were to receive them; and they were as greatly delighted to come as our men were to have them come. Two days before I left to come over here they wanted to write and tell you through me how happy and pleased they were to have the advantages of the experience of those men who had been in this work for three or four years and had obtained such magnificent results. Unfortunately the rules would not permit of my carrying that letter, so I give that message to you verbally. As I say, they are all as happy as possible, they are doing splendid work, and they are doing work that will be of enormous advantage to your men. Moreover, they have the advantage of working with men who have been at it now for four years. That work is perfectly new work. We knew nothing about it before this war. It has had to be developed with extraordinary rapidity. These men are taken in hand first by the dental surgeon, who fastens their jaws together and then by the surgeon, who sees to their faces and tries to improve their appearance as much as possible. Probably he takes a piece of bone out of their body, out of the crest of the ilium, for instance, or out of their ribs, and makes new noses for them, using cartilages perhaps to make a framework. In a very little time it is marvelous the things that are done there. There is one enormous advantage that we have got there, and that is the extraordinary interest that our women are taking in the treatment of these patients, as in the treatment of soldiers generally. Perhaps one of the most beautiful sights I have ever seen in the world was to see that old queen mother, who is I suppose the most beloved woman in England, as she went around talking with and consoling the wounded. I am glad to see you smiling with approval, and your smiles are worth a million dollars, and they do not cost a cent! You women of America I think can smile more sweetly than any other women on earth!

We intend to keep before us always that principle of efficiency and economy of personnel as well as specialization of function and fixity of tenure.

Dr. David Silver, Pittsburgh, said:

In a recent lecture Sir Robert Jones said, "The pathetic side of orthopedic surgery is the collection of physical disabilities which should never have been." This is a strong, indeed a startling, statement, yet it implies no criticism of the splendid medical men who are at the front. We all recognize the terrible difficulties under which they are working, and we know that it is and will continue to be impossible to do away entirely with those conditions; but we are impressed with the importance of such an organization that the number of cases which will require subsequent corrective measures shall be reduced to the minimum.

A large part of the orthopedic work to be done will be due to adhesions in and around joints, and to the results of the sequelae of infection. In proportion as the surgeon is able to perform primary or delayed primary suture of wounds, the damage of infection and its danger will be eliminated, and the number of cases of this type will be diminished. This alone furnishes the means of eliminating a very considerable amount of the subsequent reconstructive effort together with necessarily long retention in hospital, not to mention the needless pain and discomfort which the men must suffer.

Among the conditions which the Surgeon-General has assigned to the orthopedic surgeon are malunion and nonunion of fractures. In at least a large number of cases these imply failure in effective focalization or inefficiency in the continuity of mechanical control. In the early days of the war it was recognized that a great deal of the trouble from malunion and nonunion resulted from frequent inspections of the patient at the different dressing stations and from the frequent changes in the type of treatment that was instituted. It becomes, therefore, of the greatest importance that we organize this treatment effectively and decide on that plan of treatment which will be applicable throughout the entire management of the case. It is fortunate that this has already been begun. As you probably know, among the expeditionary force a committee was organized, and it was decided to limit the number of splints used to seven, so that the men who are now in Europe are using an exactly similar method of treatment. A further step in advance, I believe, has been the appointment of seven orthopedic surgeons to supervise the control of splints and the management of nonoperative treatment whenever the injuries are of a somewhat similar character. It cannot be denied that neglect of proper mechanical control in this class of cases has resulted disastrously. Before any operation for the repair of a nerve injury will be undertaken, it is now recognized that the parts supplied by the injured nerve must have their full range of motion. Where proper mechanical control has been instituted from the first, many maltreatments are thereby avoided; and that is being made necessary in order to overcome fractures which have been needlessly allowed to take place. This again implies a uniform plan for the nonoperative treatment of these cases.

Recognizing the conditions which have just been mentioned, the Surgeon-General has planned to place in each reconstructive unit one man who has been trained in the application of the proper mechanical principles and who can grade the cases in which acute surgery plays the most important part in relation to later reconstructive work, not only in shortening the reconstructive period but also in obtaining a much better result.

In the early period of the war, circular amputation was often rendered necessary on account of the prevalence of infection. This naturally called for a later reamputation, with resulting loss of considerable portions of the bone, and in marked contraction of tissues which necessarily took place. This objectionable feature was later overcome by the introduction of stump extension, preventing retraction and conserving a considerable portion of the bone. It is reasonable to hope that in the future it will be possible to discard that necessarily unsatisfactory method of amputation and return to the more ideal amputation methods of civil practice. It is most important that the surgeon produce those results which will be the most satisfactory from the standpoint of the artificial limb. Great attention must be paid to the requirement that there be on the stump the best opportunity for future artificial appliances to be attached. Furthermore, that there be proper attention paid to the care of the stump to prepare it for the application of a temporary appliance. It is now customary to apply such an appliance within several weeks after the healing of the amputation, instead of waiting after the operation for several months for the stump to attain its final form. This not only shortens the period of incapacity but is of distinct value in the mental rehabilitation of the patient.

The Reconstruction Problem as it Relates to Nervous and Mental Diseases

Richard H. Hutchings, Major, M. R. C., U. S. Army, Washington, D. C., said:

One of the surprising developments of the present great war is the importance that mental and nervous diseases have assumed in all the belligerent countries. It was thought that a new disease had made its appearance, and the term "shell shock" was coined. When the patients were returned to home territory and there was opportunity to observe them more carefully, it was soon determined that shell shock is nothing new. It belongs in a well-defined group of diseases which lie between the nervous and mental and partakes of the characters of both, namely, the psychoneuroses. The only way in which shell shock differs from the psychoneuroses encountered in civil life is that the symptoms are to a large extent determined and colored by the sights and sounds of battle instead of by railway accidents, fires, and other scenes of danger common to civil life.

The unprecedented intensity of the present war puts a severe strain on the nervous system of even the most robust. Indeed, it is the nervous system that must bear the brunt of warfare, different from any ever before experienced. Instead of long marches, and campaigns with periods of rest and freedom from danger, we have trench life with constant exposure to danger from the ground and air, broken sleep and the never ending monotony of daily life.

Guided by the experience of our allies, the Surgeon-General determined that in the selection of the American Army, every care should be used to exclude cases of incipient nervous and mental disease and by that means, as far as may be, the disabilities resulting from them.

Well qualified examiners in mental and nervous diseases were stationed at the officers' training camps, the recruit depots and the Army camps and cantonments for this examination. With the exception of some of the organization which went abroad early last summer, all of the men have been subjected to these examinations, and more than 15,000 cases deemed unsuitable for military service by reason of the existence of nervous or mental disease or defect have been recommended to the disability boards for discharge—about 1.5 per cent.

It is too early as yet to say what influence on the health of the Army this elimination of unsuitable material will be in actual hostilities, but we feel sure that many thousand fewer beds will be occupied in the military hospitals by reason of it, and the men who otherwise would have occupied them will be at home doing what they can in industry and helping to support the fighting men at the front.

Notwithstanding the care that has been exercised in prevention by elimination, we shall have mental and nervous patients to care for, and provision has been made for the insane, epileptic and psychoneurotic. At the Government Hospital for the Insane at Washington, temporary buildings are being erected to care for 500 additional patients; General Hospital No. 4, Fort Porter, N. Y., has been set apart for the care of the insane, and when necessary other accommodations will be made available.

In neurology and psychiatry, however, the reconstruction will be almost wholly mental. Practically every soldier who has been confined to the hospital will require some mental reconstruction to counteract what is known as hospitalization—the habit of being idle and dependent, and of being waited on and needing guidance.

The experience already gained in our civil and military hospitals for the insane has shown so well the advantages of work in the cure of the insane that its usefulness is no longer questioned. It is planned to place the work in charge of instructors who have had experience in work of this kind in civil life. These instructors will be commissioned officers in the Medical Reserve Corps and Sanitary Corps. They will be assisted by civilian aides—teachers of arts and crafts, agriculture, landscape gardening, shop-work, and, in fact, all occupations which have been found in the past to be adapted to the purpose.

It is believed that war neuroses, the so-called "shell shock," can be treated most successfully in hospitals apart from other classes of patients. Their symptoms are such as to attract attention—sometimes ridicule, sometimes sympathy. Any notice of this kind only serves to accentuate the condition and prolong the attack. The best results have been obtained abroad by impressing on the mind of the patient that his case is a hopeful one, that recovery will occur as soon as he exerts himself to gain self-control. The well meant visits from relatives and even strangers usually do harm. The patients should remain under a modified military discipline, and as soon as his condition warrants, exercises in the form of drills and marches are to be employed, and in the intervals and also earlier in the disease, while the patient is yet confined to bed, occupation which will serve to divert his mind from his symptoms. Occupation will also aid to gain better control of his muscles, to overcome tremors, functional paralysis and other physical symptoms which interfere with his activity.

A hospital for war neuroses has been established at Plattsburg, N. Y., utilizing the permanent buildings of the Army post which is situated there. It affords accommodation at the present time for 1,000 patients, and other buildings available, after repairs and reconstruction are completed, will have sufficient capacity to afford accommodation, if necessary, for 2,000 patients. There are ample grounds for agriculture and gardening, and shops will be provided and equipped to afford remunerative employment to those patients who are not suited for outdoor work. An officer commissioned in the Sanitary Corps, to be known as educational director, will have charge of these activities under the direction of the medical officer in command. Instruction in various arts, crafts and industries will be provided through civilian aides.

The importance of recreation has not been overlooked in formulating plans for the treatment of these patients.

The objects to be attained in the therapeutic employment of the insane and neurotic are to divert the mind from delusions and morbid introspection into more wholesome channels of thought. The element of interest should not be overlooked. As soon as work becomes mechanical, requiring no exercise of active attention, the mind is free to pursue morbid trains of thought, and the employment results in no further benefit to the patient than perhaps some improvement to his physical condition.

Exactly the same benefit can be derived from play as from work. In fact, the distinction between work and play is perhaps more an economic than a physiologic consideration. Mere diversions, on the other hand, where the patients are entertained by the efforts of others, they themselves remaining passive, are of distinctly less value but have a place, provided the element of interest remains strong.

The best results will be gained by a judicious combination of remunerative work combined with sports requiring activity of mind or body or both, so arranged that the day will be fully occupied for each individual according to his particular requirements.

As convalescence proceeds and the ability for continuous mental application is strengthened, opportunities will be afforded the soldier to prepare himself for his return to civil life and the responsibilties of self-support. The way out of the realm of mental disability has led him to the curative work shop, and through this many find opportunities for increased efficiency and larger remuneration on his return home in the advantages which will be his for taking in the vocational school.

DISCUSSION

Sir James MacKenzie, London, England, said:

If I am to be of any help to the doctors who are engaged in this work, the first thing I would say is to keep your head and exercise common sense. You will discover that these wonderful diseases that have been described are nothing more nor less than those you have encountered in your general practice. Speaking, as a general practitioner, let me say, that you will discover that the principles of treatment that you have employed for yourself and for your patients are the best for the soldiers. You know that when you get tired and overworked or have perhaps some slight illness so that you feel weak and irritable, your wife suggests you should go for a holiday. Wives are generally very wise in these matters. You come back wonderfully recovered. That is the treatment the vast number of these soldiers want when they come back from the front "rattled." In place of simply calling them "rattled," we call them all sorts of fancy names. Simple treatment is what is needed. Arouse the soldier's interest in life and outdoor sports.

I would put recreation in the fore front as a cure for a great number of nervous diseases that effect men. I for one always take care not to speak about things that I do not know, and of shell shock and similar neuroses I will say nothing except that they are a form of what we have long known as neurasthenia. I cannot distinguish them from that, nor can I see that the so-called neurocirculatory asthenia is any different from neurasthenia, at least what we will find in the surgical wards.

The admirable hospital shown us was excellently adapted to the purposes for which it was designed, except that there should be a great space reserved for games. If you study a large number of people you will find that some have the game spirit, others have not. As a therapeutic measure, games have never been sufficiently recognized. I know that I used to avail myself of the curative power of games to a great extent when I was in general practice. In addition to the game spirit there is something which I do not encourage, however, to too great extent—a little bet is wonderfully stimulating.

When the government at my suggestion established a hospital for the study and treatment of cardiovascular diseases, one of the propositions I laid down was there should be sports attached to it, skittles, bowls, croquet or anything else. It was not workable then, and somehow or other they could not get my idea, so my idea has never yet been carried out in a systematic manner. But I have succeeded in getting my men well far more rapidly than those who performed perfunctory exercises in hospitals. The principle that one must avail of in all cases is to get the man out of himself by arousing an interest in sport.

The greatest problem is how to measure properly or assess the value of symptoms. It has never been attacked in a scientific manner. What is the result? Simply guessing. When you say, "This man is not fit," or "This man is fit," you are simply guessing. As an illustration, let me refer to the question of murmurs. They form a large part of the consideration in regard to the mental possibilities of the patient. When through the use of the stethoscope we try to know what the meaning of murmurs is, we search in vain for a clear definition or for knowledge how to assess the value of the murmur. It is laid down as being impossible of assessing. Twenty years ago one of our great physicians in Scotland, Sir William Gardner, in addressing a body of men who were supposed to be specialists in heart diseases, men who examined for life insurance, made this statement, that "Whether it will be possible in the future ever to assess the value of the murmur, I cannot tell. At present we do not know what to do with it. We either reject the candidate or we write him up, or we ignore him; but there is no principle whatever that guides us." Bear that in mind. I would seek to ask you strongly to consider that question whether you should not be able to assess the value of this sign on scientific lines.

I have after thirty-five years endeavored to evolve a principle which will guide you, and if you will carefully understand the meaning of it probably it may help some of you. A man turns up, you discover a murmur or peculiarity, or he has pain, or some other condition, and he wants to know what his future is to be. Now I have devoted the greater part of my life to the solution of that question; it has meant an enormous amount of work, the taking of hundreds of individuals who have had murmurs or pain, and I have kept note and have watched them as they proceeded through life; boys growing into manhood and pursuing military and other occupations; women and girls growing up, getting married, having children, watching the effect of pregnancy, taking a large number of observations, sometimes over a period of twenty-five or thirty years; and I have worked out certain conclusions.

When I write those conclusions down they can be summarized on a scrap of paper about the size of an ordinary page. They are simply common sense rules; for instance, in regard to heart affections you have to consider the efficiency of the heart, how the individual responds to effort—and there is a lot in that last. After all, in estimating the value of any peculiarity it is a matter first of all of common sense.

The essential fact to be determined in every case always is: What can the heart do? What does it do? In answering form questions, in all cases that last and most important question is always left out. That is just as important in the army as in examining for life insurance. When you come to deal with returned soldiers, out of a hundred thousand that will come back from the front you will have 10 per cent. of them invalided out of the army because of some abnormal sound of the heart. Just before the war I had drawn up and Sir Alfred Keogh had recommended for adoption my description of how to assess the value of these abnormal sounds of the heart for the use of the army. Time went on, and it was simply ignored. You cannot begin to teach by a simple memorandum men who were taught on wrong lines in the schools. Just before I left London a typical case came before me of a young fellow who was invalided out of the army because he had a murmur which in my opinion was physiologic. His consciousness of that murmur had broken him down and rendered him unfitted for his work. The consciousness of something of that sort has a most astonishingly depressing effect. I have seen large numbers of such cases. For instance, a farmer came to consult me because he was not able to do his work. I asked him as to his condition, and his reply was vague and indefinite. I said, "What started your illness?" He said that he went up to be examined for the army and was rejected because of a murmur, and he had never been able to work since.

A careful record should be kept by those who are engaged in examining for such symptoms of these people and followed up in their after life to find what happens to them, because there is a great lack of knowledge in regard to what happens to people with these simpler affections. This is an opportunity for advancing the cause of science which let us hope will never come again. But we have here the opportunity to study and classify these cases, and arrive at some conclusions that will eventually enable us to assess accurately the value of these special symptoms. If some of you young men will undertake this work, twenty years hence you will be able to form some idea of the prognosis.

CHAIRMAN BILLINGS said:

The point brought out by Major Hutchings and Sir James Mackenzie I desire to emphasize. I want to drive home, if I may, the fact that these disabled soldiers should have the opportunity for active physical exercise which play embraces. If we have learned anything from overseas it is that active exercise as a physiotherapeutic measure takes the place of passive exercise or massage to a great degree so that active control—military control, if you please—does much more to restore function than passive exercise. Yet of course massage or passive exercise has its place, and particularly for the maimed man. But control cannot alone be used. Active exercise in the form of baseball, football and tennis can be used as a curative measure for these men. If we are to give them this opportunity we must have land enough provided with our general hospitals to have playgrounds as well as work places. We must have paved streets and necessary buildings with appropriate surroundings so as to conduce to the health and spirits of these men. To do this work well the Surgeon-General should have these hospitals located suitably for the purpose for which they are to be used.

Reconstruction of the Defects in Hearing and Speech

LIEUT.-COL. CHARLES W. RICHARDSON said:

The administration of this section of the Division of Physical Reconstruction will be both military and civil. The military staff will consist of a director and assistants. The military staff will be composed of an assistant director, inspectors and a surgical staff in charge of necessary medical and operative procedures. The surgical staff will be the members of the otolaryngologic section of the Division of Surgery of the Head, attached to General Hospital No. 11, Cape May, N. J., or surgeons elsewhere designated by the section of otolaryngology, to perform such operative work and apply those therapeutic resources as the directors of these sections may mutually deem necessary.

On account of the character of the disability in a large percentage of the defects coming under the charge of this section being of such a nature as to require reeducation, it is necessary to have an educational staff to meet these requirements. This staff will consist of: (1) superintendent; (2) principal, and (3) teachers. The superintendent (selected) is to be a man. The person selected to fill this office is a man coming from one of the largest institutes connected with the teaching of the deaf, a person who is thoroughly conversant with the methods employed in all its phases. The principal (selected) is a woman who possesses a keen knowledge of the principles to be employed in the correction of defects of hearing and speech. She has already had a large experience in pedagogic work and in maintaining an *esprit de corps* among her teachers.

As women have in a greater majority than men devoted their energies to this pedagogic endeavor, we have found in selecting teachers that it was wise to accept as candidates for positions as teachers, women well trained in lip reading. We have already listed sixty candidates for positions as teachers for the defects in hearing. These teachers are thoroughly trained in the teaching of the adult hard of hearing, and constitute practically the pick of the United States in this work among those who are able to accept service. We have also listed forty-six teachers who are willing to serve under various individual restrictions. The selection of teachers for corrective speech work has not been so easy a task as the selection of teachers for defects in hearing; nevertheless we have succeeded in selecting some excellent material. We have already listed thirty-seven candidates for teaching positions in this field of endeavor. It is quite probable if there is an increase in patients over what is normally expected that it may be necessary to assign also a principal to the teachers of speech correction.

As it is possible that a colony system of reconstruction may be established later, and as it will probably be necessary to delegate teachers to go to other hospitals to teach patients whose major wounds hold them at general hospitals for full reconstruction, it will be essential to have inspectors to oversee the work. We have in view, already in the service, several male instructors who will make most competent inspectors.

The defects in hearing are acquired in manifold manners:

1. We have those due to the ordinary diseases of the ear, common in civil life—abscess of the ear, both acute and chronic, and acute and chronic catarrh of the middle ear. These are simple infections or secondary to the acute infectious diseases.

Those due to warfare are: 1. Shock concussion. This type of case is most frequently due to the action of a single high explosive shell in the immediate vicinity of the one afflicted. Many of these patients eventually recover their hearing completely. 2. Concussion deafness. These cases are usually due to the continuous action of high explosive and shrapnel shell, hand grenades and the more or less continuous play of machine guns. On account of the continuous concussion transmitted to the labyrinthine structure there are evident organic changes produced in the internal ear with the result of permanent impairment of hearing. 3. The slowly progressive type of concussion deafness as so commonly observed in gunners and artillery men. 4. Traumatic, due to casualties about the auditory apparatus or head.

Defects in speech are: 1. Mutism, most frequently of shock origin. 2. Stuttering, stammering—old cases reestablished; new ones produced during the nervous stress of actual combat. 3. Aphonias, neurotic, overstrain of vocal organs, and due to nerve and muscle lesions. 4. Affections of voice due to gunshot, shrapnel, grenade, bayonet and other wounds of the face and upper air tract.

In considering the various types of injury as the result of war casualties there are two in connection with the auditory and speech organs that bring home to the average layman the horrors of warfare.

The disturbance of the auditory apparatus terminating in immediate or remote complete and permanent impairment of hearing is the most impressive in connection with audition.

In our study of the permanently acquired deafness in the adult in civil life we have been impressed with two important features, not physical, apparently correlated with the loss of hearing, i. e., suspicion and social ostracism. These conditions are in no way physically related to deafness, but are more the outcome of the psychology of the deaf mind and the psychology of the nondeaf mind. The deaf person, not hearing what is said around him, becomes necessarily more or less suspicious that general conversation is directed at him personally or relates to his infirmity. We are all well aware that most normal hearing persons have an aversion toward conversing with the hard of hearing or deaf. Add to the state of mind thus created the torment of the various physical subject symptoms, and you necessarily create in the deaf an unhappy state of mind. Contrast a person so afflicted with one afflicted with blindness. The blind has a serene mind born of the knowledge that all mankind extends to him a helping hand, a confidence begotten through the knowledge that universally mankind sympathizes with and is only too happy to give him succor and aid.

The other condition to which I wish to refer is the modification of the voice which is attendent on the terrible face injuries produced in modern warfare. It is a singular trait of mankind that he avoids the deaf and derides the individual who presents difficulty of speech production. These poor individuals are not only subjected to the humiliation on account of their imperfect vocalization, but are subject to the curious observation and scrutiny on account of their facial defects. How different is the mental view held by the general public with regard to these unfortunates and the blind.

It will be the province of the section of defects of hearing and speech to remove these mental attitudes, first, through reeducation and corrective work with patients, and second, through correction of the misapprehension of the layman.

The section devoted to the defects of hearing and speech has well under way the practical development of its plans. The defects in hearing include all those soldiers and sailors whose hearing, with or without casualties of the auditory apparatus, has been completely impaired or reduced to such a degree that their social and industrial intercourse with others is greatly hampered. Defects in speech include those who stammer, who have loss of voice, or whose form of speech is defective from injuries in the speech-producing organ.

The method of procedure to be adopted in the reeducation of the defects in hearing is through stimulation of the auditory centers in certain cases; through lip reading; and, where lip reading is impossible of results, through manual teaching.

The defects in speech are to be taught along the lines which have been established for the restoration of the neurorespiratory cases. Those cases the result of injuries to the upper air tract and face attended with loss of soft and hard tissues to greater or less extent, will require individual study as to the desirability of further prothesis or operative work for the replacement of lost parts; support and reapplication of attachment for muscles, or release of scar contraction in order to restore impaired voice production.

A careful study is being made of synonyms or homophonous words so that where as result of injury certain single or groups of muscles cannot functionate, that synonym which can be used by the patient may be suggested, and used as a substitute word or phrase in the patient's vocabulary.

The location of the parent school or teaching hospital will be temporarily at General Hospital No. 11, Cape May, N. J.

This department of the Division of Physical Reconstruction is presided over by a director, with the rank of Lieutenant-Colonel, M. C., N. A.

It is very satisfactory to note that the American Association to promote the Teaching of Speech to the Deaf; the Volta Institute; all heads of teaching methods; all institute superintendents, with whom we have had the pleasure of consulting, and all teachers of corrective speech with whom we have consulted, assure us of their hearty aid, support and sympathy, and express their approval of the scope and ultimate vision of the work we have in hand.

Reeducation of the War Blinded

Lieut.-Col. James Bordley, Jr., M. C., N. A., Staff of the Surgeon-General, Washington, D. C., said:

Colonel Richardson, who just preceded me, has made the mistake that is usually made by the world; he has mistranslated the position of the blind. Their attitude is not an attitude of happiness, but rather an attitude of resignation. They are really the Ishmaelites of this century, made so by our economic system. They are unable to procure and maintain their own homes; they have been driven out of the community life; they are not permitted to be a part of any industry. The blind have for centuries asked for a chance, and Colonel Richardson is right when he says they have been extended charity. This is not due to any premeditated purpose on the part of society; it is one of the mistakes of our economic system.

From now on we must conserve, and in nothing is conservation more important than in the saving of human energy. As we reestablish or rebuild that economic system we must remember that the blind are a part of our social fabric, that their brain and brawn must be utilized as an asset to the nation. Strange as it may seem, every great advance in the treatment of the blind has followed in the wake of war, and this war has proved no exception. In England, France and Italy they have suddenly discovered that the blind have a real economic value, and they have started out on a broad scale to study that value, to determine and weigh it; and of all the things that have been produced by this war, none are really more wonderful than the results of their experiments in this direction.

The Surgeon-Generals of our Army and Navy have combined forces, and together they are going to educate the soldiers and sailors and marines. This education is to be given them in a military training school for the blind which is to be located on a magnificent estate in Baltimore. This school is to be conducted by the best teachers of the blind in this country. It is to have every appliance which is known and is available in the development of the powers of the blind. When they complete their courses in that school, trial employment will be given them.

We divide the blind into five classes: those who can work at home, those who can work in blind shops, those who can enter industry, those who can go into agriculture, and the professional classes. We are not going to let any of these blind men get away from us until we know that they are ready to go to work.

We propose to utilize the services of every individual and of every organization which can help in this splendid work. The American Branch Belgian Blind Relief Fund has already come to our assistance in a most substantial way, bringing over $100,000 with which to conduct a certain portion of the work. The American Red Cross, at the request of General Gorgas, has authorized the organization of the Red Cross Institute for the Blind. This Red Cross institute will supply the necessary economic and social supervision for our soldiers, sailors and marines from the time of their discharge from the Army or Navy until they die. This supervision is not to be a charity but a helpful moral support. This institute, for instance, has already organized a purchasing department through which will be bought in quantity, at wholesale rates, the raw materials used by the blind in their homes. They are also organizing a selling department, because one of the great disadvantages of the blind who work at home is the limitation of their market. This selling agency is to take charge of this work of selling the finished products of the blind. It is starting a savings association, because one of the greatest difficulties the blind man has is to get the means wherewith to make his initial investment in material and machinery and tools. This savings association will not only take the man's money and properly invest it and safely keep it for him, but when the time comes for him to work it will be behind him financially and help him wherever he needs help. We recognize that the blind man has three serious difficulties to overcome before he can make his own living: The first difficulty is his own timidity, the second is the misplaced sympathy of his family and friends, and the third is the reluctance on the part of industry to employ him. To overcome his own handicap, we are going to educate him. To help the family to realize the man's ambitions, the man's troubles, to see the necessity for their moral support in his work, we are going to take one member of the man's family to Baltimore and educate her side by side in our school with the man himself. We propose to keep that member in Baltimore in the house that will be conducted by the Red Cross institute at no cost to the family. To overcome the difficulty of the reluctance of industry to employ the blind, we propose to help the blind man demonstrate to industry that he can take his place and do his part.

The speaker now showed lantern slides and commented on them.

On account of the geographic distribution of our Army we are obliged to have two services or plans of work, one in France, and the other in this country. The service in France, so far as blind men are concerned, begins when the man gets back to his base hospital. We have no intention of going forward to that hospital in order to teach him or to help him. So we begin with the service in the base hospital. In that hospital no serious attempt will be made to teach the man how to help himself to make a living. He will only be taught there how to amuse himself. We shall have our professional instructors there, people who can teach him how to play games. Then when he is through with his base hospital treatment and surgical treatment he goes back to the special hospital center which has been designated as the point of concentration for the blind. In this center we shall have our field director for the blind, who will have supervision over all the work throughout the whole of France; under him will be instructors. In this hospital they will go a little further than in the base hospital, and will try to teach him reading and writing and games; in other words, to begin the serious work of making the man realize that he has abilities that can be developed; in other words, to teach him how to shave and dress himself, how to walk with a cane, how to play games, how to write his own letters, and how to read books for the blind. Then we come to the port of embarkation and ocean transportation. Here are helpers or teachers for the blind, who will also teach the men with other handicaps who will come back on the same ships with the blind, so that they can take care of and amuse them also. Thus there will be no point of transition between their work here and their work there; there will be no two weeks of monotony in which they can deteriorate, which of course with the blind is a very serious handicap.

Then we come to the service in the United States. The men come to the port of debarkation, and come into the hospital for distribution. They are summoned before a special examining board which acts as a vocational board. If this board finds that the man's injuries are permanent and nothing can be done for him, he is sent over to our blind teaching school in Baltimore. If they find that he has still efficiency they may send him to a reconstruction hospital. After he has had his surgical work done there and it is found that it is impossible to do anything further for him, he goes to a blind teaching center. This is a military department. It has its instructor who is an experienced man in handling the blind. This is one of the largest institutions in the United States. The instructor is chosen on account of his particular fitness and adaptability. Under him will be teachers and schools and shops of the mechanical and vocational type.

Then after the man finishes his work at the schools we come really to the practical training. After he undergoes his practical training then he gets training in professional work, commercial work, the trades or agriculture. After that work is done then he will take a course in the institute for the blind, and they will follow him in his work in his home for the rest of his life, making sure that his wants are satisfied.

(*End of Morning Session*)

PROCEEDINGS OF THE CHICAGO SESSION

THE SIXTY-NINTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION
HELD AT CHICAGO, JUNE 10-14, 1918

THE MEDICAL MILITARY MEETING

MEDINAH TEMPLE, WEDNESDAY EVENING, JUNE 12

Medical officers of the Army and Navy occupied reserved seats on the stage. The music for this meeting included singing by the audience led by the members of the American Choral Society and accompanied by the Fort Riley band.

The meeting was called to order at 8:15 p. m. by Dr. Arthur Dean Bevan, President of the Association, who said:

Ladies and Gentlemen: This great meeting tonight is a war meeting of the organized medical profession of America to pay homage to the great leaders of the medical departments of the Army and Navy, the Red Cross, and conservation, and to hear from their own lips their call to the medical profession. This meeting is one to which the American medical profession has invited some of the great leaders in medicine of Great Britain, France and Belgium. These countries are allies in this war for civilization. These countries have sent these men across the seas to us at this time as the representatives of their respective countries and their medical professions to tell us their story, to give us the benefit of the lessons they have learned, so that we can make the mobilization of our own medical profession more efficient. We welcome them here as our brothers. We feel that we belong now to one great family. We share with them the same fortunes and the same future. We shall stand by them and by all our allies to the end—and there can be but one end. (Applause.) The right, humanity and civilization will prevail. The medical profession and the country are fortunate that in this great emergency the medical department of the Army is under the leadership of a man in whom the entire profession and the whole country have absolute confidence—General Gorgas. (Loud applause.)

General Gorgas, on rising to speak, was enthusiastically received. He said:

Address of General Gorgas

Mr. President, Ladies and Gentlemen: I am very glad to have this opportunity of speaking to our profession on the subject we have in mind, that is, the accession to the Medical Reserve Corps. We could all understand what conditions were a year ago, and how they are changed at the present time as far as our profession is concerned and their relationship to the military service. A year ago we had about 700 men in the Army; now, we have in the neighborhood of 20,000 commissioned medical officers. (Applause.) The task of getting these 20,000 men into the service seemed a year ago to be stupendous; but we have appealed to all our great associations, and their response has been most prompt and loyal. The result is that we have succeeded most admirably in this first stage of the war.

I wish to express my appreciation for all the profession has done, the organized societies of the country that have helped us; but more particularly do I wish to thank the indi- viduals. We, as a profession, are so accustomed to altruism from the time we are born that we little appreciate ourselves the altruism the rank and file have shown in coming into the Army in this war. The doctor, from the time he first com- mences the practice of medicine, is accustomed without thought to give a larger portion of his time for nothing than men in any other calling. I have often thought why this was. I do not think a doctor is any better man on the average than men of the same education in the community. It has seemed to me that it is the result of his education. From the time he goes into the profession he is taught that it must be done: that the poor and those who are not able to pay must be looked after. The whole community comes to look on it as a duty of the doctor. The doctor is expected to give half of his income in these ways. No other members of the community think of doing this, but it is so general, so universal, that the doctor never refuses; the community has come to look on it as the proper and just thing for him to do. And so I think that our profession in this war has responded to a greater extent and made greater sacrifices than any other branch of the community; I mean sacrifices in the way of responding to the call because a greater percentage of the members of our profession have answered the call than any other class or any other profession, and they have given without stint everywhere. (Applause.) Men have sacrificed their incomes, sacrificed their comforts, and sacrificed their conveniences. Men who have incomes varying from $50,000 to $100,000 a year have given them up for captaincies. It is a great and laudable thing, and I admire it; but these men have saved money and earned independence, so that when they come back they can live on what they have saved. I want, however, to pay my admiration to the rank and file of the profession, the young men with practices of $2,000 or $3,000 a year, with one or two children, with mortgages on their homes, who drop all these things, knowing that when they come back they will have to commence all over again; and yet these men have come to our aid without any hesitation. So far as I can see there is very little holding back of the members of the profession. I do not see it anywhere; but what comes to me is the man who wants to come in, who gives up home and makes great sacrifices for his country. I wish to express my gratitude to our Corps and to our fellow soldiers for what they have done and are doing. I myself have not the slightest doubt that if we need more men we shall get them. There are many more men in the medical profession who are perfectly willing to make sacrifices as necessity appears more urgent and closer to them.

Finally, I am glad to have met you on this occasion, and I wish to express the gratitude I feel for what you have done in the past. I have in my mind the old definition of gratitude, that is, a lively appreciation of favors that are to come. I thank you. (Loud applause.)

President Bevan said:

Great Britain at the time of the war saw her duty. She realized that it was a war of civilization against Prussian domination. She refused to stand aside and see Belgium crushed and France invaded and dismembered. She defended for almost three years not only Belgium and France and her own rights, but also our own. We owe her a great debt; but great as it is and late as we have been, we shall pay it. (Applause.) We are going to stand shoulder to shoulder with her and our other allies to help to win this war. Great Britain has sent us three of her strongest and best known men, and I have the pleasure of introducing to you, first, Sir James Mackenzie. (Applause.)

Address of Sir James Mackenzie

Sir James Mackenzie said:

Mr. President, Ladies and Gentlemen: I cannot tell you how much I feel at the cordial reception which you give us and the cordiality with which we have been received ever since we landed in America. I had the fear when I came here that I would meet a people who were somewhat luke- warm. Your enthusiasm has exceeded anything beyond what my imagination could have thought about. (Applause.) I have had my suspicions that this was peculiarly an enthusi- asm limited to the medical profession, because every medical man that I met was kindness, cordiality and encouragement itself. I have asked them about it, and there is no individual in the whole population that knows the people so well as the medical man. I have asked them time and again how do the people among whom they live look on the war at present, and they have unanimously informed me that the people are just as ardent as they are themselves. Time was when we were under the impression that the American people thought there was not much difference between the English and the Germans; that we are in the war to get something. Now, ladies and gentlemen, I was one of those stupid English peo- ple who trusted the Germans, who never believed there would be a war. I was warned time and again by my friends about what was coming. One of my friends, Professor Sherrington, a great physiologist, came back from attending a meeting of physiologists in Germany in 1912 and told me of the sentiments expressed by the physiologists, that they were preparing for a war against England; that they were going to down the English Navy. Well, I thought I knew the Germans pretty well and I trusted them. When the war broke out, when all of what I had believed regarding Germany was dispelled, I was staggered and said to myself, is this a quarrel between Russia and France? But when Belgium was hit, to whom we had given word that we would stand by her, there was no longer any hesitation of what we should do, and from that time we entered the war with grim determination that never shall the sword be laid down until Belgium, Russia and other countries shall be as free as we are today. (Applause.)

There is great difficulty in understanding why this war should have come about; but as one with open eyes looks on the people he discovers not only the mere tendencies of the people but the curious life of the people themselves which it is difficult to express. We have a common phrase known to Englishmen and Americans of what is a gentleman, a man of honor, of integrity, and of chivalry. The kaiser said he wanted this war fought like a gentleman. Where was his chivalry when he murdered Miss Cavell? Where was his chivalry when he sent to the bottom of the ocean innocent women and children? The word is unknown to the Germans. There is another matter which shows that the Germans have respect for us which they do not like to acknowledge, and a very simple incident will bring that to light. One of my nephews told me in 1915 when he was at the front with forty soldiers in No Man's Land, there sprang out of a trench a small boy dressed as a soldier, who did not seem to be more than 15 or 16 years of age. He came running to a party of soldiers exclaiming, "Take me prisoner; take me prisoner!" The leader of the party said, "Go away, we do not want to take you a prisoner," but he exclaimed, "My mamma told me when I saw English soldiers to hold up my hands and beg them to take me a prisoner." They left him alone, and the poor little German followed them in whatever they did. Whenever they sat down to eat, they gave him some food. When they went back to the trenches the little fellow begged to be taken a prisoner. Can you imagine an English or American mother in such a state of mind that she would want her boy taken a prisoner by the Germans and that they treat that boy as our soldiers treated the German boy? This little incident, ladies and gentlemen, gives you a sort of idea of the difference of thought that runs through the whole system which governs us and the system which governs them. I thank you for the attention you have given me. (Applause.)

President Bevan said:

Great Britain has sent to us with this party one of her great surgeons, one of the men who has been doing outstanding work in the reconstruction of the wounded. I am going to call on Sir Arbuthnot Lane to say a few words to us. (Applause.)

Address of Sir Arbuthnot Lane

Mr. Lane was very warmly received. He said:

Ladies and Gentlemen: I happened to be the honored guest at a dinner party in Berlin on the occasion of Sir Edward Gray's very firm letter to the Germans about the invasion of Belgium. There were present at this dinner party several officers who were infuriated at the course events took. They told me as their guest that if they could have got money from the Jews they would have blown us to hell. They dilated on the great advantage that Germany possessed over England, of how the Germans were such an exceedingly intelligent and cultured nation, and how the English were such a stupid nation. They spoke of how the English had control over the greater part of the world, but they were quite unable and unfit to manage their possessions; that the Germans intended to take all of their possessions, and as soon as their army was strong enough and their navy was big enough, they intended to destroy France first and ourselves afterward. I was amazed at the candor and turned around and expressed my astonishment. I am not sure that there isn't a certain element of truth in our stupidity as a nation. (Laughter.) As you know, Lord Roberts told us what was coming. We did not believe him. When I say we, I mean the large majority of the people in Great Britain. They did not believe it because they could not imagine any nation would be so unscrupulous and dishonorable as the Germans intended to be.

We were fortunate in coming from England in having as our companions some very big men and women connected with industries, and it would be difficult to match these men and women for intelligence and for their grasp of the general situation. It was certainly a liberal education for us and I think we took full advantage of it. They told us they had gone over there to see the suffering and bravery of our noble allies, and the immense losses of the Belgians and the French. The Italians had suffered greatly, and they wanted to realize what we and those nations were doing to help on the progress of the war. They told me that they were coming back to America to tell you of what was being done there and to encourage you to take a more active part in the war than you had done. They amazed me by saying that there were numbers of people in America who took little or no interest in the war, and I said to myself that there must be some mistake somewhere, for wherever I have gone the medical profession has preceded any other profession or any other body of men. (Applause.) But among every other part of the community I found personally that there was the same enthusiasm and same desire to fight and beat our foe. We have a magnificent example in the leadership of that magnificent nation with which we are so closely associated now. I suppose they have got the finest general the world has ever known at present, and the British have the same general confidence in General Foch that you have, and we are perfectly certain that he will lead our armies to victory. We have no hesitation whatever on that point. (Applause.) Those men and women told me the reception they received in England was the very happiest, and they said they left England with the feeling of greatest regret. One man told me after he had been shown around all day long by one of the heads of a department, the man turned around and said, "Will you excuse me for a few moments. This morning I got a telegram that my only son was killed." That is the spirit that pervades us all, and I am sure the Americans will not be behind us in this respect. (Applause.)

President Bevan said:

One of the greatest tributes that has ever been paid to a nation has been paid to Great Britain for the response of her colonies in this war, and I am going to call next on a Canadian surgeon who is serving with the medical service of his mother country in the field, Col. Herbert A. Bruce. (Applause.)

Address of Col. Herbert Bruce

Colonel Bruce said:

Mr. President, Ladies and Gentlemen: I feel a little more at home with you than either of my distinguished colleagues because my earliest experience in this war was in the Canadian service, and there I met hundreds of your countrymen who, when the Germans were appearing on the roads to Paris, forgot about the imaginary line and came over and joined our Canadian forces and helped to add to their fame on the field of battle. We recollect in the dim and misty past some feeling of coolness and at times bitterness about this imaginary line, but thank God the shoulders of your young men and our young men touch as they march against the foe, and the German war lord has realized that the bond of liberty representing the nations of the world has been united stronger than his cannon and more enduring than any war machine that any future autocrat may devise. (Applause.)

Serving in the imperial forces for something like a year and a half, I have had somewhat varied experiences up and down the line from the North Sea to Switzerland, but never in my life have I been as deeply and as profoundly stirred as when I looked into the faces of the tear dimmed eyes of the generous Parisian crowds when they saw coming into their city that great American soldier, General Pershing and his staff. (Applause.) From the base up to the line at the front I have seen your men straining at the leash of discipline which held them back, and you know better than we, for we were on the ocean, of the jolt they gave the German soldiers and German morale in their first engagement a few weeks ago. (Applause.)

France has had two great emotions—one when the British soldiers came, and second, when the American soldiers came, and France will not forget.

I have had the privilege of visiting all the hospitals which your government so promptly sent to our help, and which are doing such wonderful work for the British sick and wounded in France. You sent us of your best, and it is only necessary for me to mention the names of these well known surgeons to make you realize the excellent character of the work which they are bound to perform:

Majors John Finney and Hugh Young of Baltimore; Majors George E. Brewer, Charles H. Peck, William Darrach, Fordyce, St. John, McCreary and Stevens of New York; Lieut.-Col. Hugh Cabot and Major Harvey Cushing of Boston; Majors Harte and John Gibbons of Philadelphia; Major Fred A. Besley of Chicago; Major Fred T. Murphy of St. Louis, Majors George W. Crile and William Lower of Cleveland, and many others too numerous to mention. I cannot speak sufficiently high of the magnificent work which these doctors and your American nurses are doing.

Before leaving France, Lieut-Gen. Sir Arthur Sloggett, the Director-General of the British Medical Service, sent for me and asked me to tell the American people how much he appreciated the wonderful service which the American doctors and nurses had rendered to the British sick and wounded. He said their work had been beyond all praise. He had been anxious to give recognition to the gallantry and heroism of the American medical officers and nurses serving at the front, and had recommended them for honors, but a regulation of your government prevented their being accepted. Nothing that we can do is too good for the American doctors and nurses serving with us.

Your medical men have willingly taken their places alongside our officers in positions of danger, and have as a consequence suffered casualties in exactly the same proportion as our own doctors serving under the same conditions.

BELGIAN AND FRENCH GUESTS AT THE ANNUAL SESSION

During the recent retirement, although tremendous difficulties were imposed on the Medical Service, the wounded were all safely removed to hospitals in the rear, and none were allowed to fall into the hands of the enemy. The nursing and medical personnel also escaped, although unfortunately suffering some casualties.

If I were to be asked as to the greatest military development at the front during the past year, I would put at the top of the list the creation of a generalissimo to command the united forces, and the brigading of your troops with the British and French into a great united and compact army. (Applause.) And next I would speak of the tremendous war machine that peaceful, unprepared Britain has prepared since the war began. We have heard much, and we do not underestimate the great military power of Germany which she has built up during half a century; but Britain has fought on a score of fronts, has been banker and provisioner to our allies until you took her place. The "contemptible little army" of 100,000 which went over and fought and mostly died was quite unprepared with guns and munitions, and was in the most disadvantageous position as compared with the unlimited supplies which Germany had developed during many years. That small army of 100,000 was replaced by 2,000,000 men, and the meager supply of shells which kept its guns mute for days at a time has grown until the British supply today is more than a match for the Germans. (Applause.) Please consider these facts: Britain's munition works turn out in a single day more big shells than during the whole first year of the war; more medium sized shells in five days than during the whole first year; more cannon in a week than during the whole first year. Her munition plants have a breadth of 40 feet and a length of 25 miles, and these buildings have been constructed so as to be turned into profitable industrial uses when peace returns. (Applause.) And we should not forget that England has increased her steel output from 7,000,000 to 10,000,000 tons; transforming 400,000 motors for carrying munitions and supplies, for the manufacture of agricultural implements, for the manufacture of tanks and railroad engines—in fact, meeting every demand of the war. And no less in her navy have the sailors proved heroes of the war. Every week 5,000 British ships leave or come to her harbors. She has loaned 600 ships to France and 400 ships to Italy. These ships have transported 8,000,000 men to and from her shores, and 10,000,000 tons of war material. Notwithstanding the submarine, her merchantmen sail the seven seas. (Applause.) During the first few months of the war not less than 200,000 women were engaged in war industry; today there are 1,000,000 women so engaged. (Applause.) Of the 4,000,000 workers the women constitute one fourth, and their number is daily increasing, and not less than the men are the girls and women soldiers, heroines. (Applause.) The girls handle the deadly T. N. T. and the still more deadly fulminate of mercury with a steadiness of hand and a smoothness of movement that has demonstrated in every instance they are superior in this regard to men. (Applause.) All grades of society are occupied and every branch of industrial life are all linked together in England's need. Social distinctions have been leveled in the democracy of overalls and caps. A woman worker, whose husband had died at the front, took a day off, and then returned to her work. In the evening the superintendent of the factory found this inscription chalked on one of the lathes: "Done fourteen today; beat that if you can, you devils." (Applause.) Such is the spirit of the women.

I recall the incident when Great Britain sent her expedition to Ashantee, and when a colonel of the Scotch Guards was addressing his men he said to them, "I will not command any one to go on this expedition; there will be suffering; there will be misery; there will be hardships; there may be death. Let every man who will volunteer to follow me take one pace to the front." So saying, he turned his head so as to give the men time to think and to act. Looking around, a flash of indignation went over his face as he saw the line was as solid as it had been before. He turned to his men and said with a touch of scorn, "My God, the Scotch Guards and not a single volunteer." A sergeant, touched to the quick at the rebuke, rushed toward the colonel and said, "Sir, that whole line stepped forward." (Applause.) Ladies and gentlemen, what a great thing it would be for the nations of which we are citizens, for the homes that we represent, for the principles for which we fight—yea, for the institutions which we uphold, if we could all catch that vision and, looking into the face of the generations yet to be, say to them, This has been a bloody business, but the whole line of civilization has stepped forward. (Applause.)

There is a light about to gleam,
There is a font about to stream;
There is a midnight darkness changing into day,
Men of thought, and men of action, clear the way.

(Loud applause.)

PRESIDENT BEVAN said:

The republic of France; glorious France; immortal France. We are proud to be again your ally. In our struggle for independence you made it possible for us to establish for the first time in modern history a government ruled by the people.

We have owed to you for more than one hundred years a great debt; we come to pay it now.

General Pershing, standing before the tomb of Lafayette, expressed the feelings and the emotions of America when, with uncovered head, he said, "Lafayette, we are here." (Applause.) France has sent to us four of her strong men. I shall introduce to you, first, Mr. Justin Godart, who has done outstanding work for the medical department of France in this war. (Applause.)

MR. GODART spoke in French. He referred to the splendid and unselfish work that is being done in France by the American representatives of the Red Cross, and of what American physicians and surgeons were doing, and stated that France and other countries owed America a great and everlasting debt of gratitude for what America had done and was now doing.

PRESIDENT BEVAN said:

I shall call next on one of our French colleagues who comes direct from active service on the Western Front, Major Edouard Rist of France. (Applause.)

Address of Major Edouard Rist

MAJOR RIST said:

Mr. President, Ladies and Gentlemen: On behalf of the French medical profession at war, it is my privilege to address the American Medical Association this evening. To my last day I shall be proud for having had this privilege.

Your Association has always stood for everything that is best and noblest in this, our most noble profession. It has striven to set forth the highest possible ideals and standards of medical education and medical ethics. It has fostered with unequaled zeal the ideals of devotion to mankind. There is no more public spirited body of men in this country than the American Medical Association. What you have achieved during the first fourteen years of peace of this century is, I am sure, the greatest work which any organized profession has ever endeavored to do and has ever succeeded in doing. The present condition of your medical schools, of your hospitals, of your state and city health departments, the value of scientific work which is constantly coming out of your laboratories, are ample testimony to the idealism of your purpose and to the efficiency of your methods. They are an example and a model for the whole world, not only for their intrinsic value but for what they show us. They show what a self-conscious, well organized, democratically organized medical association can achieve when it is inspired by a common ideal and by self-disciplined energy. You have been in the service of your country during peace, and now you are in her service at war. Indeed, the spirit in which your Association entered this war, unreservedly devoting itself to the pursuance of it is, in my opinion, a most fitting symbol of the spirit in which the American nation as a whole entered this war. (Applause.) Your iron will, your clear sighted and unyielding determination will guide and direct the American nation up to the end—and there can be only one end—and there is no more fitting symbol of the perfect friendship and confident cooperation between the nations who are fighting together this great war than the friendship and cooperation which prevails between the medical professions of the allied countries. They are all bent on the same purpose and united in the same feeling of duty toward their country and toward our common cause. (Applause.)

Meetings like this, at which the medical men of the United States, of Great Britain and her Dominions, and of France sit together in order to exchange their observations and views and to learn from each other, used to happen only once in a while before this war. Now, believe me, they are almost daily occurrences, not, of course, on this gigantic scale, nor in such a beautiful hall; but over there in France the medical men of the allied nations are in constant touch with one another. They cooperate daily in every way: in the evacuation work of the wounded, as well as in the medical and surgical care of the wounded and sick, in the equipping and building up of hospitals and the relief of refugees, as well as in scientific research connected with war problems. We have learned to know each other and to love each other. (Applause.) American medical men in France have made a name for themselves, not only because of their professional excellence but because of their perfect courtesy, their delightful simplicity of manner and generosity of heart. I cannot

COLONEL HERBERT BRUCE

BRITISH GUESTS AT THE ANNUAL SESSION

tell you how rapidly and how comlpetely you have won our sympathies. The medical men of America have given first to us, even before the American nation entered this great war, and we shall never forget it, and now we have your fighters with us, your boys. What they are doing now on the battlefields speaks for itself. There are no words which can describe it and which can express what we feel about them. Let me tell you just one thing, they are as dear to us as our own boys. (Applause.)

Germany has repeatedly announced to the world that her intention was to separate the allied nations from each other. This she is trying to do by military action as well as by political intrigue and propaganda; but the real outcome of this war is and will be more and more to draw close to each other all the nations who are fighting for the freedom of the world. (Applause.) During the terrific drive which the Germans attempted on the Somme River this March and April, they publicly stated that their immediate aim was to separate the British Army from the French Army; but they succeeded in uniting these two great and glorious armies tighter than they had ever been united, under one supreme command. (Applause.) They succeeded in provoking General Pershing's generous and welcome proposition to blend together American units with British units and American units with French units in the same regiments and in the same divisions. (Applause.) There were three allied nations' armies on the western front. There is only one army now. (Applause.) There is one army made up of the combined strength, skill and courage and devotion of the three allied nations. That is how they separated us.

Ladies and gentlemen; there have been many explanations given of the mental distortion which has made Germany a criminal among the nations of the world. What infringement of the natural laws of moral and mental soundness can be made responsible for an attitude of mind which is so utterly repulsive to us? In my opinion, among the many delusions of which the German nation has been a victim, the most important perhaps is the delusion of growth. Growth is one of the most important and mysterious phenomena of biology. It is beautiful in itself and fascinating to study, but it has its limits, and it has its own end. In every living species there is a specific fixed limit for the growth of the individual, and the perfection of the individual must be realized within these limits. It is the same with the organs within our bodies. Growth which exceeds those limits is not only abnormal and ugly, it is dangerous and destructive. A butterfly which grows to be as big as an eagle would not be more beautiful or more perfect; but a butterfly is just as beautiful and perfect in its small size as the majestic eagle. Now, that is the thing which the German nation cannot understand. Belgium was only a small nation, but just as industrious and as ingenious as the big German nation. It has played a great part in the history of civilization, and it has produced everlasting works of art and of science. But Belgium was just a small lovely butterfly which had not been able to grow as big as the German eagle; therefore, it had to be crushed and trampled under the feet of the German army. Germany has sacrificed everything to the delusion of growth and for the sake of growth, and the other nations have been too slow to perceive it. I need not tell you medical men that there is such a thing as a malignant growth of a tissue or of an organ. It begins invisibly and noiselessly, and no doubt the first stages of a new growth are very interesting to study under the microscope and it makes very nice figures. Have we not been watching this strange and uncanny growth of the German nation with a little too much friendly disinterestedness of the pathologist? But now this malignant growth has shown itself in its true light. We had better call it as the people do a cancer which separates the normal cells from each other, which obliterates blood vessels and destroys and kills. There is only one remedy for this growth—the knife. (Applause.) It is applied now. The surgical team doing the work is the best the world can afford. Great Britain, France, Italy and America are at it. Let them do the work thoroughly so that there shall be no recurrence. (Applause.) Let them extirpate this malignant tumor, this poisonous German growth, lest it should infest the whole body. It is hard work, gentlemen, it will be long work, and it is ugly work; but it has to be done if the world is to be saved and freedom restored. (Loud applause.)

President Bevan said:

Brave Belgium; bruised and tattered Belgium; despoiled and devastated Belgium; outraged and enslaved Belgium, but unconquered and unconquerable Belgium. (Applause.) We and our allies pledged ourselves to free and restore you, and we shall redeem our promise. We asked Belgium to send us that great surgeon so well known to the medical profession of this country, Dr. Depage, whose wife had endeared herself to so many American hearts and who lost her life in the sinking of the *Lusitania.* On account of the military emergency, Depage found that he could not come, but he has sent his right hand, his assistant, Captain Réné Sand of Belgi whom I now introduce to you. (Applause.)

Address of Captain Réné Sand

Dr. Sand said:

Mr. President, Ladies and Gentlemen: Your hearty welcome tells me—and it is not the first welcome since I have been in America—what Belgium means for your country. I will tell you now what America means for Belgium. We did not know you very well before the war. We had heard of your immense resources and of the constructive spirit of your democracy; we had heard of your creative and inventive genius, but we did not know what is most important and the most valuable part in a man as well as in a nation—your heart. (Applause.) Now we know. You have stood by us and for us since the first days of our fight. You have succeeded by a plan that is unique in history in feeding, in clothing and in keeping alive our whole nation during months and months and months across the ocean. You have sent your splendid doctors, your admirable nurses, your Red Cross representatives, but you have done more than that; you have given us your hearts, and today the whole Belgian nation gives you back love for love. (Applause.) Every parcel of food you have sent over, every toy that the American boy has deprived himself of in favor of the Belgian child, every penny you have saved for our children has been not only a material but a moral relief. Every day, for almost four years, you have given to 7,000,000 Belgians that sweet and warm and strong feeling we have around our hearts when we know that somebody cares for us. I will not thank you nor praise you for what you have done. It is beyond praise and beyond thanks. A young brother does not thank his big brother who has helped him; he loves him, and that surpasses everything, and that is how we feel for you. (Applause.) It is in this love which is born from our misfortune and through your generosity that the fraternal love for America and Belgium stands united forever. (Applause.)

President Bevan said:

It is the purpose of the American people to create and maintain the largest and most efficient navy in the world. The medical department of that great navy, that greatest navy, is being splendidly developed by Admiral Braisted, whom I take great pleasure in introducing to you tonight. (Applause.)

Address of Admiral Braisted

Admiral William C. Braisted, Surgeon-General, U. S. Navy, said:

Mr. President, Ladies and Gentlemen: I have been enjoying myself today in going over your magnificent training station at the Great Lakes, and I have come here very tired, but very much enthused over what I have seen. Not having prepared anything special for you, I am going, if you will permit me, to run over a few things that have been going through my mind today. First, the seriousness of the situation, the extent of the problem just before us. You may have noticed a few weeks ago a tendency on the part of Germany, so it seems to me, to attempt to strengthen the bonds of the states which compose the middle Europe empire that she is attempting to make. That is loosely accomplished. An enormous territory has been demanded by Germany. In addition to that, we have the enormous area of Russia, and we have been told that German prisoners taken by the Russians were encouraged to bring about friendly relations, to intermarry, with the idea of creating the feeling that Russia and Germany should be one. So you see we have before us an enemy with tremendous territory, with the possibility of enormous supplies both for food and for material supplies or manufactures with millions of men. I imagine Germany's desire is to create this enormous middle Europe empire, hoping probably to take some, if not all, of the channel seaports. It seems to me, I can see in that extent of her ambition what she is attempting to do. This territory, of course, may be increased over into Asia Minor as that union is very loosely joined, and it will be her attempt to strengthen and demand that, and if that should be done, you see we have against us these millions and these supplies and the possibility of a bitter war being continued for an indefinite time. It has seemed to me that we must be prepared for an indefinite struggle, for a struggle against a bitter foe, a relentless foe, where there is no compromise, and it will take from us every bit of energy and every bit of strength and every bit of tience and every bit of resource that we can possibly assem- e to overcome this struggle we are now in.

In the Navy we have been through something over a year n war. I look back as Surgeon-General of the Navy with great deal of satisfaction on the year that has passed. It as been a splendid year for us; it has been a very active ear. We have been in the war since the first of April a ear ago. In the Navy it has been active warfare. Much as gone on you do not know about, but in time you will e shown the important part that the Navy has been taking n this war, and it has been largely responsible for the success that we have had as far as we have progressed. I view with much pleasure the remarks that have been made about the Medical Corps of the Army and its work. The health of the Navy has been good. We have managed to expand good hospitals. We have hospital ships which we have managed to equip splendidly, including transports, and this work has been done admirably and in a very rapid manner. All this work has been accomplished in the medical department by ourselves. I have asked no help from any one. In time we may ask for help. As yet, we have not asked for one bit of help. That, I think, must show the splendid organization with which we have started, an organization founded on many years of study and of trial, so that I feel we have in the Navy an organization which is complete, and that success demands only material supplies and personnel.

So far as the health of the personnel of the Navy is concerned, of nearly half a million men, it is running about as it does in peace times. At the end of the week of June our casualties, deaths, for all diseases in the Navy was only 2.8 per cent., a very excellent showing for the whole length of the war from casualties due to disease in every quarter of the globe, casualties due to accidents, casualties due to military activity, etc. We have lost out of half a million men which we have now about four men a day on an average. When I first figured that up it seemed to me that it must be impossible that the mortality should have been so small as that. Of course, the conditions that exist in the naval service are far better than you find them in civil conditions in every way. Nowhere can you find sanitation that compares with that we have in the Navy. Ship sanitation must always be most careful and the most improved. Did you ever think of what would happen if contagious disease attacked the fleet and could not be controlled? I have in my time stood face to face with conditions which made me think that the entire fleet would be necessarily affected. To prevent these conditions the utmost care and watchfulness is needed constantly. Very few of you realize the enormous expansion that is going on. Every day something undreamed of or unheard of comes up and is calling constantly not for a change of organization, because we know what to do. We do not have to be told what to do, but the question arises, Am I going to have material supplies to do it with and the personnel? That, gentlemen of the American Medical Association, is where I am going to ask your help. As I have previously said, so far we have done it ourselves. You have heard nothing from the Navy being unequipped. Everything is all right. Everything is fine, but I shall ask your help and your cooperation at any moment when I feel that there may be need of it, and I know as I look in your faces I shall not ask in vain. Everything that can be done by humane men will be done by you to help me in my work in the Navy. (Applause.) But remember this: the Navy has always been ready; the Navy always will be ready, no matter what may happen in this struggle that is going on. We are ready, we are brave, we are strong, and we are resourceful. You need have no fear that your Navy will not acquit itself with credit wherever it may be. (Applause.)

As I went out today to the Great Lakes Training Station I saw the finest and largest naval training station in the world, with 35,000 of the finest young men I ever saw in my life. (Applause.) As I stood and looked at them as they passed in review, the thought came to me, what will be the outcome of this war? And I said to myself, the answer lies in the faces of these boys. (Applause.)

President Bevan said:

In the organization of this country for war, it became early evident that the food problem was a vital one. The conservation of our food resources, the proper division of our own bountiful food supply with our allies was regarded by the government at Washington as a problem of first importance. Probably the most efficient man in the world was secured for this task, Mr. Hoover. (Applause.) Mr. Hoover has called to his assistance many of the ablest men in the country, and the ablest of them all we have with us tonight, and I want to introduce to you Dr. Ray Lyman Wilbur, President of Leland Stanford Junior University. (Applause.)

Address of President Ray Lyman Wilbur

President Wilbur said:

Mr. President, Ladies and Gentlemen: We stand tonight with a catch in our throats watching the great offensive on the other side, for the world is standing breathless today watching the race between the United States and our allies and Germany, and wondering whether we shall have a sufficient number of men in this fight before it is too late. We heard these terrible words from Lloyd George when he said that England was too late at Gallipoli; that England and France were too late to save Serbia, too late to save northern Italy and too late to save great Russia when she began to topple and crumble as no great nation ever crumbled, and the question that stands before us tonight is, Are we to be too late? No one can answer this question, but it is in the minds and the hearts of the American people not to be too late if we are to meet this crisis as it stands. Our safety tonight depends on the integrity of the Italian, the French and British people, and nothing else. (Applause.)

If you will stop for a moment and look back into recent history you will see that the integrity of a people depends on the food supply and on the morale. Hungry people fight only for food. Men are all alike. They have got to eat. When there is no food for the baby, the mother or the wife, men gather together and they tear down the government, no matter whether it be Petrograd or Chicago. We are all alike, and the one vital and fundamental thing is food for fighting peoples. When the Food Administration of this country was organized and we were facing the harvest in 1917, we knew the civilized world was going to struggle in order to go on with its food supply. We have had to devise some method of bringing the American people into that food problem to teach them the necessity of food conservation, the significance of food in war, and the fundamental character of food. Today through a campaign of education and response on the part of the American people, we are going to send out of this country by the first of September 150,000,000 bushels of wheat. Through self-denial the American people have raised 140,000,000 bushels of wheat. (Applause).

Revolutions originate in bread lines. Human beings are all alike. It was the fundamental thing for us to do, and we have sent that wheat and are going to send a sufficient amount of products of beef and other things required. We are going to extend our bread lines wider and wider as the war clouds get darker and darker. The whole thing leads us to hope that the American people can go into this war in the same way that they have the food problem. God has been good to us. Our fields are green. We are beginning to reap the harvest from the crop of 1918. We shall have 300,000,000 bushels of wheat more than we require to send to our allies. (Applause.)

Great offensives are possible when there are great reserves. We have great stores of food in reserve. In the winning of this war, food constitutes a very important factor. I appeal to you members of the medical profession of the United States with your influence among the people to wake up this great country, to stir the people as they have never been stirred before, to make sacrifices and make still greater sacrifices to win this war. Why should we say to France, Go on with this war, when she has lost already 1,300,000? Why should we allow the other nations to suffer large losses without pitching into the heat of battle ourselves when we know that the American people can settle this war within a reasonable time? We have seen what England has done, and we know what we can do; but we must have the spirit, the willingness, the same attitude of self-sacrifice that we have put into the food problem. As I have said, one of the great essentials to meet offensives is great reserves in the way of food supplies and material. It is these things that will count in the end. President Wilson has said, Why limit the Army to 5,000,000? Why not get 6,000,000 or 10,000,000, and ask the people for further deprivation and further self-sacrifice? We have already been told by the fuel administrators that we are 50,000,000 tons short in coal. Are the people paying attention to this problem? If not, they ought to do so because it is a serious matter. Every unit of human energy must be put into this war. Why not put it in soon? I repeat it again, Why not put it in soon? because I feel the medical profession can get at the important things if it wants to do so, and can make the people realize that only by material things can we demonstrate by our spirit that we mean business. We cannot do it with flag waving and by making speeches. Every unit of human energy must be put into this war by the men and women of the country in order to bring it to a victorious end for the allies. We have got to make the men on the other side feel that the hearts of the American people beat with them, and we must get the material things over there—ships, food supplies, and everything necessary to establish absolute confidence, so that we can hold up their morale and make them realize that our hearts beat in unison with theirs. When that has been done, we can exclaim, Hold that line, you courageous men of sunny Italy, you brave men of France. Hold that line, you noble men of Belgium. Hold that line, you stalwart boys of America! Hold that line until we get the men and guns, so that all together we can crash our way through the western front and settle this war against our ruthless, barbaric foe, Germany! (Loud applause.)

President Bevan said:

When this program was arranged we asked Italy to send us a delegation of their best men. I am sorry to say, at the last minute, Bastianelli, the great Italian surgeon, wired us that on account of the great activity on the Italian front it was impossible for him to be with us here at this meeting. But our hearts are with Italy, and their hearts are with us, and I want you tonight by a rising vote to give me authority to send to Bastianelli and through Bastianelli to our Italian colleagues our greetings and be of good cheer, because we are coming to help them win this war. (Applause.) (The entire audience arose and cheered lustily for Italy.)

President Bevan continued:

On the battle line in the starving countries invaded and devastated by the enemy, in the countries sickened with plague and pestilence, in our own mobilization and everywhere throughout the world is an angel of mercy giving succor to these great armies under the banner of the Red Cross. (Applause.) We have with us tonight one of the men who for more than a year has led the American forces of the Red Cross in France—Major Alexander Lambert. (Applause.)

Address of Major Alexander Lambert

Major Lambert said:

Mr. President, Ladies and Gentlemen: America perhaps distinguished herself when suddenly called to war by going into the war Red Cross hand first. She did not have an army to send, and she sent as rapidly as possible the Red Cross, which is the other arm of her army and the arm of the government. I think very few of you realize how much of a governmental function the Red Cross really is. It is usually looked on as a private society to give volunteer aid to the wounded and to care for the sick, or to stand ready at any time in calamity to help those in dire need. In reality, it is a governmental function—yes, founded on international treaty, incorporated by act of Congress, under the command of the President of the United States, as is the Army and the Navy, and in its incorporation it says that, besides being prepared to give voluntary aid to the sick and wounded, it is the society, and the only society, through which the people of the United States give voluntary aid to their Army and Navy in time of war. That voluntary aid is simply that which any friend would do to help any other friend or any human being in distress. This, in brief, is the work of the Red Cross, and what it is doing and has done is to build up in France an organization to look after the sick and wounded and to render aid to citizens wherever possible.

It has been my fortune to go from the North Sea in Belgium down through the entire front line, down and back to the line, and down into Italy as far as Rome itself. I have no stories of excitement to tell you. It has not been my lot to go into that form of life. It has been a matter of fact work to do and of duty done.

I have often been asked by persons what one's feelings are under fire. What is it that you feel? True it is, for the last two or three months in Paris we have been under a constant queer bombardment of a long range gun which drops a shell in Paris every twenty minutes that explodes without warning and without any previous idea when it was to come or where it was to go. Some nights this cannonading would begin as early as 1 in the morning and keep up all night, and then perhaps cease for a day. The feelings of the boys under fire is perhaps best expressed by one of the engineers at Cambrai. After a battle, an English officer, who complimented him on the efficient work he had done, asked him if he had ever been under fire before, and he replied, "No, sir." "What do you think of it?" said the officer. He replied, "I didn't mind it much, but I noticed it took my mind off my work." (Laughter.) That I think is the best description of a soldier's feelings under fire.

The Red Cross has built up its hospitals to care for the sick and wounded or any other Americans in France. It is built up to care for certain hospitals in conjunction with the Army. The Red Cross is now taking care of the American wounded coming down to the end of the Montdidier line. Besides that, it cares for the refugees. It cares for the people of France, that it may help them in their work, because the Red Cross has as much to do with the Allies as it has to do with its own people and with the Army which you sent there. It has found that it could hearten the people. It is not the nation fighting as an army sent forward to fight another army that is going to win, but it is the fact of nations fighting together, and the civilian population that can hold out the longest and stand the strain will be that population which will win the war. The ones that give in first will lose it, and that we must remember. You must learn to realize that you have to bear the great strain coming on you, and that strain will be tremendous compared with what you have already undergone. Your Red Cross has heartened the people among which it lives in caring for the refugees and in giving them attention as the necessity arose.

In the last drive, for instance, in March, back of the line, as they came down toward Montdidier the strain became very great, and the wounded were rushed back in such numbers that the hospitals could not care for them, so it was the duty of the Red Cross to load the motormen's trucks in Paris and have them take surgical dressings that had been made to the wounded. We took the surgical supplies out of Paris to the wounded men to meet the needs of the hour. Strange as it may appear, the Red Cross found some hospitals improvised and the men in them working beyond the power of human endurance. It found them without anesthetics, without any surgical aid whatever. The Red Cross gave them aid. It gave them dressings; it gave them every necessary thing it had and so it fulfilled its mission in caring for the hospitals. The Red Cross is caring for the wounded, in helping to give them those things which the doctors and nurses do not find time to give to the sick. That is one of the things that one friend would do to another in hospitals where there is so-called social service. The Red Cross is everywhere working for and working with to help the boys you have sent across the seas. We are aiding them in the way you would wish them to be aided.

There is a tradition in France that none of the statues of Jeanne d'Arc have been destroyed, and wherever you go it is true. Along the front lines these statues seem to have borne a charmed life for they are still apparently untouched. There is one charming statue at Compiègne facing the hills beyond the line where an attack is now going on. It is only a few miles behind the line. It is the charming statue of a young girl, standing, and holding a flag in her hand. Her face is lifted up in earnestness. As I looked at this statue in the twilight, there she stood calling to those of us to come and help her people. There she stands seemingly as imperishable as the valor of her people. Will you not harken to her call? Will you not realize the moral effect, great as it is? Will you not realize the great effort you have made, and that you must make still greater efforts? Will you not harken to this little maid of France and help her? Will you not arouse your people to come to the aid of her people? I believe you will. (Loud applause.)

THE PATRIOTIC MEETING

AUDITORIUM THEATER, THURSDAY EVENING, JUNE 13

The patriotic meeting of the Association was held, June 13, at 8:30 p. m. Several patriotic musical selections were rendered by the Great Lakes Naval Training Station Band. Bob Dyrenforth sang patriotic songs, with the audience joining in the chorus.

Dr. Ludvig Hektoen, in calling the meeting to order, said: You are the guests of the Chicago Medical Society, the local branch of the American Medical Association, and it is as chairman of the Committee on Arrangements that I bid you welcome.

In former years it was customary at the annual meeting of the American Medical Association to hold a President's reception on Thursday evening. Since we entered the war it has seemed better to replace this nonessential function with a patriotic meeting as befitting the spirit of the times. Tonight there will be presented to you other subjects of the greatest importance in relation to the war.

Science and the War

Prof. John M. Coulter, University of Chicago, was introduced as the first speaker of the evening, and spoke on "Science and the War." He said in part:

In presenting such a subject as science and the war, one must choose between a somewhat detailed account of the services rendered by the different sciences and a very general statement which omits details. A few samples of the emergency problems that have come to the National Research Council, however, may give a better conception of the range of such work. All sciences are contributing to the prosecution of this war. Some of them entered into it in a more spectacular way than others, but all of them in a real way. The great profession represented in this meeting is a conspicuous illustration of service so obvious and immediate that it is perhaps better appreciated by the public than are the other fields of scientific service.

Among the emergency problems referred to for fields of scientific investigation may be mentioned a few samples. To physics has come such problems as the detection of submarines, adequate range finders, and improvement in wireless apparatus. Chemistry is dealing with the absorption of noxious gases, synthetic drugs, new specifics, the preparation of special military maps, indexes of military zones, interpretations of topographical maps, and so on. Geology is interesting itself in the description of camp zones, in the recognition of adequate water supplies, in the materials for right building, and in sources of necessary materials. My own work on the National Research Council has had to do with problems relating to plants and the uses to which plants are put through raw products of all kinds. We are discovering what we have of the newer stock in hand, which is far greater than we imagine. The most pressing plant problem is that connected with food production because everything else depends on it. For years our rate of increase in food production had been falling rapidly behind the rate of increase in population. Such a disparity between the two rates of increase could not be allowed to continue if there was no war; but when the war came, as you know, the problem became tremendously more acute. It was discovered that the chief reason for this lack of food production behind the population was a lack of cooperation, that is, a failure to apply the knowledge already available in reference to the most effective methods of handling plants. Isolated investigators in various parts of the world solved important problems, but the results were never brought together and focused on our great need. It has been discovered that the knowledge now available, if applied to the result in food production, would overtake the population if there had been such scientific cooperation in the years that have gone as exists today, and we would not have heard of wheatless days. All of these restrictions of our food administration are simply to help us bridge over this transition. Cooperation is the only method not only to render effective service but also to secure scientific results. Science in this war represents training that is of immense service in meeting emergencies. It has not restricted itself to superficial progress, but has been dealing with fundamentals, and its range of application is wide, and it offers this training because more than anything else it is patriotic, not in the Prussian sense but in the sense of international cooperation and service. (Applause.)

The Law and the War

Judge Charles S. Cutting spoke on this subject. He said in part:

We lawyers are taught to believe in the sacredness of contracts, and all of us Americans ought to be thoroughly imbued with the idea that a solemn compact, whether it be between men or between nations, is something which is made to be kept and not to be violated at will. Military necessity, like any other necessity by one of the parties to an obligation, is an exceedingly convenient way to violate absolutely a solemn agreement. Who is the judge as to military necessity? The power that invokes it and it alone. This throws to the winds all idea of fairness, of justice, of right, of law. Law is the cement which binds together civilization, and without it we relapse into savagery, and savagery is followed by the desecration of the law.

When our great Army shall have come home, let us hope that it shall have on its face, "This world is now safe for democracy, and a world fit to live in. It is of the people, for the people and by the people"; and when that day arrives, I am sure there will go up such a shout of joy from San Francisco to Boston, and from the Lakes to the Gulf that the world will know that the great power that exists for right, for law, for constitutional liberty has spoken, and that the die is forever cast. (Applause.)

President Bevan said:

This is one of the largest and most successful meetings the American Medical Association has ever held. I want to call your attention in a few words to the flag that hangs in the back of this hall, the service flag, with 23,146 stars. This is the service flag of the American Medical Association and represents the number of physicians who have gone into the service.

American Ideals

Bishop Charles P. Anderson spoke on this subject. He said in part:

Whether we be doctors or priests, lawyers or professors, farmers or artisans, soldiers or civilians, rich or poor, or whether we have decorations in front of our names or after our names or not, we are primarily men—men who have been made in the image of God and men who will be measured not by their titles or decorations or positions, but by their moral bulk and their constructive energy for the betterment of the human race. The danger in a professional life is that we are apt to become stilted and mechanical and lose the dignity of the man in the routine of a profession. No profession ever became a great profession until it had produced a great man, and no great man ever lived apart from great ideals. It is about ideals that I shall speak to you tonight, especially as they are represented in American life and thought and action.

We have witnessed during the last year the expansion of a great moral conviction among the American people. The rank and file of our citizenship is not familiar with the intricacies of international law. We are certainly not familiar with European bunglers. Candidly, we are not much interested in these aspects of the case; but we have certain old-fashioned ideas of right and wrong. Our people have been asking themselves for a year, Is it right or is it wrong to do certain things? Is it right or is it wrong to break your word, to violate a treaty? Is it right or is it wrong for the strong to oppress the weak? Is it right or is it wrong to bring about wholesale murder of human beings for any military purpose whatever? Is it right or is it wrong to instigate barbarous practices that shock the individual conscience, even of the savage? And the American conscience is answering these questions in this way: Those things are wrong and they will have to be set right. We have ideals, and we have faith in our ideals. We are ready to make sacrifices for our ideals, and if the submarine does come close to our shores and threatens, or if the drive over there in France should seem to penetrate through that line, and if that should be followed by propositions of an ignoble peace, we will answer back as did John Paul Jones when he was sorely smitten and threatened of being overcome, "Oh, thou enemy, we have not begun to fight yet." (Applause.)

THE HOUSE OF DELEGATES

Third Meeting—Thursday Morning, June 13

The House of Delegates, in accordance with the action taken at the meeting held on Tuesday afternoon, met at 8 a. m. and was called to order by the speaker.

Dr. D. Chester Brown, Connecticut, chairman, presented supplementary reports of the Committee on Credentials, stating that ten additional delegates had registered and were entitled to seats in the House of Delegates, and recommended that they be seated.

Dr. V. G. Vecki, California, moved that the report be adopted. Seconded and carried.

MAJOR ALEXANDER LAMBERT, M. R. C., U. S. ARMY
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

The secretary called the roll and recorded 117 delegates present.

The minutes of the previous meeting were read and approved.

Election of Officers

The next order of business being the election of officers, the House proceeded to an election, which resulted as follows:

President - Elect — Alexander Lambert, New York.

First Vice President —William N. Wishard, Indianapolis.

Second Vice President—E. Starr Judd, Rochester, Minn.

Third Vice President —C. W. Richardson, Washington, D. C.

Fourth Vice President—John M. Baldy, Philadelphia.

Secretary — Alexander R. Craig, Chicago.

Treasurer—William Allen Pusey, Chicago.

Speaker of the House of Delegates—Hubert Work, Pueblo, Colo.

Vice Speaker of the House of Delegates—Dwight H. Murray, Syracuse, N. Y.

Members of the Board of Trustees—Frank Billings, Chicago; Wendell C. Phillips, New York; Thomas McDavitt, St. Paul; and, to fill vacancy caused by the death of E. J. McKnight, for a term expiring in 1919, D. Chester Brown, Danbury, Conn.

Members of the Judicial Council, for a term of five years—W. S. Thayer, Baltimore; to fill the vacancy occasioned by the election of Alexander Lambert, New York, as President-Elect of the Association, whose term would have expired in 1919, M. L. Harris, Chicago.

Members of the Council on Health and Public Instruction —For the term of five years, to succeed himself, W. S. Rankin, Raleigh, N. C.; to fill the vacancy occasioned by the election of Frank Billings, Chicago, as a member of the Board of Trustees, whose term would have expired in 1921, Ludvig Hektoen, Chicago.

Member of the Council on Medical Education—For the term of five years, to succeed himself, Horace D. Arnold, Boston.

Member of the Council on Scientific Assembly—For the term of five years, to succeed himself, Roger S. Morris, Cincinnati.

The secretary presented a list of applicants for associate fellowship endorsed by the Section on Stomatology, and stated that this is the only list which has so far been transmitted to him from any of the sections.

Dr. E. Eliot Harris, New York, moved that the secretary be authorized to cast a ballot for the House of Delegates in each instance, not only of those applicants endorsed by the Section on Stomatology, but also for those applicants who may be endorsed by the other sections of the Scientific Assembly in which the applicant is not eligible for membership in the state association of the state in which he resides, and provided no objection to the applicant is filed by the officers of such state association. Seconded and carried.

Place of Annual Session

Dr. Thomas McDavitt, Minnesota, chairman, stated that there had been presented to the Board of Trustees from its Committee on Place of Annual Session two cities which are adjudged to be suitable for the accommodation of the annual session of the Association. The Board of Trustees transmits to the House of Delegates these two places without recommendation. Since the last meeting of the Board of Trustees, a third such city has been suggested and is included in the list presented, in order that it, too, may be considered by the House of Delegates. These three places suggested for the next Annual Session are Atlantic City, N. J.; Hot Springs, Ark., and Philadelphia.

Dr. Wilmer Krusen, Pennsylvania, withdrew Philadelphia from the list of places to be considered.

The advantages of both Atlantic City and Hot Springs were presented in a discussion, which was taken part in by Drs. W. T. Wootton, Arkansas; Wilmer Krusen, Pennsylvania; E. Eliot Harris, New York; H. G. Wetherill, Colorado; G. F. Cott, New York; C. P. Meriwether, Arkansas; F. D. Boyd, Texas; Otto P. Geier, Ohio, and Dwight H. Murray, New York.

A ballot was then taken, which resulted in the choice of Atlantic City, N. J., as the place for the next annual session of the Association.

Dr. George H. Kress, California, moved that the time for holding the next annual session be referred to the Board of Trustees with power to act.

Seconded and carried.

During the progress of the election, Dr. E. J. Goodwin, Missouri, moved that when the House adjourns, it adjourn with the members standing for a few moments in silence, with heads bowed, in respect to the memory of Dr. E. J. McKnight, a trustee, and to those members of the Association who have lost their lives in the service of our country.

Seconded and carried.

Supplementary Report of the Reference Committee on Legislation and Political Action

Dr. M. L. Graves, Texas, chairman, presented a supplementary report for the Reference Committee on Legislation and Political Action, as follows:

The report of the War Committee has been duly considered and we feel that commendation is due the officers of the American Medical Association for their prompt recognition of the opportunity for service to our country during this war and their loyal tender of this service to the officers of the government as well as for the good work accomplished, which has been graciously acknowledged by the Surgeon-General. We feel that the House should further assure the government that all its officers and organization will cooperate fully with and serve the government whenever desired.

The following resolution was presented by Dr. V. G. Vecki, California, and was referred to your Reference Committee on Legislation and Political Action.

Resolved, By the House of Delegates of the American Medical Association, at its annual session at Chicago, 1918, that in consideration of the impending emergency and in consideration of the indisputable fact that all interests are secondary to the winning of the war and the relief of the wounded soldiers, so splendidly fighting for our country, action be taken provisorily to establish an undergraduate class of medical men, who would have no claim to be licensed to practice medicine after the war without proper additional education as provided by present regulations.

Your Reference Committee believes it unwise to offer any inducement to undergraduates in medicine to abandon their studies, but on the contrary would urge all students to complete their medical courses and thus become qualified to render a far more efficient service to their country.

The committee therefore recommends that this resolution be not approved.

In addition, the following resolution from the Section on Stomatology was transmitted to the Reference Committee on Legislation and Political Action.

Whereas, It is highly probable that all hospitals and dispensaries may in the near future be called on to receive, treat and care for disabled American soldiers, it is recommended by the House of Delegates of the American Medical Association in session at Chicago, 1918, that all physicians of German and Austrian citizenship (including those having only their first naturalization papers of American citizenship) should be dropped from those hospitals receiving soldiers during the period of the war.

Your committee feels that the suggested action may be safely left to the judgment of the governing bodies of the hospitals themselves.

Dr. Eliot Harris, New York, moved the adoption of the report. Seconded.

After discussion by Drs. V. G. Vecki, California; E. Eliot Harris, New York, and G. F. Cott, New York, the motion to adopt was put and carried.

Supplementary Report of Reference Committee on Hygiene and Public Health

Dr. J. W. Schereschewsky, U. S. P. H. S., chairman, presented a report from the Reference Committee on Hygiene and Public Health.

The first section of this report was read and a motion to adopt was made and seconded. This motion was discussed by Dr. Otto P. Geier, delegate from the Section on Preventive Medicine and Public Health, who moved an amendment which was accepted, when the motion as amended was put and carried. The section of the report as amended and adopted is as follows:

In accordance with the directions given to the Reference Committee on Hygiene and Public Health, at the last meeting of the House of Delegates, your committee submits the following resolution concerning animal experimentation and recommends that it be adopted by the House of Delegates.

Whereas, The usefulness and, indeed, the imperative need of animal experimentation has been fully established by the improvements in sanitation resulting in the striking difference in the health of troops in this as contrasted with former wars; in the practical abolition of the dreadful wound tetanus; and in the vast improvements in the results of wound treatment; and

Whereas, Further animal experimentation is absolutely necessary for the conduct of the war for the further protection of the gallant soldiers who are risking life, limb and health for our safety; and

Whereas, Animal experimentation is absolutely necessary for meeting effectively the practice of the enemy in using poison gases; therefore be it

Resolved, That the House of Delegates of the American Medical Association in convention assembled at Chicago, Illinois, hereby reaffirms its belief that properly regulated animal experimentation is necessary for the sake of the public health; that the necessity for such animal experimentation is greater and more urgent at this time than ever; and that those who interfere with it in any way, thereby interfere with the conduct of the war and fail in the gratitude owing to our defenders.

The Reference Committee on Hygiene and Public Health reports further that it has had referred to it the following resolution which was adopted by the Section on Diseases of Children:

Resolved, That the War Council of the American Red Cross be asked to appropriate $100,000 for the purpose of better child welfare work, assisting existing organizations working in child welfare, and organizing this work when approved by the Medical Advisory Committee of the American Red Cross. This sum to be expended under the direction of the said committee.

Your committee recommends that this resolution be adopted.

Respectfully submitted by order of Reference Committee on Hygiene and Public Health.

J. W. Schereschewsky, Chairman.

It was moved that this recommendation of the committee be concurred in.

Seconded and carried.

It was then moved and seconded that the report of the Reference Committee on Hygiene and Public Health be adopted as a whole. Carried.

Supplementary Report of the Reference Committee on Constitution

Dr. Floyd M. Crandall, New York, chairman, presented the following supplementary report for the Reference Committee on Amendments to the Constitution and By-Laws and moved the adoption of the report. Seconded and carried. The report follows:

A communication presented to the House of Delegates on Tuesday, June 11, by Dr. W. T. Wootton of Arkansas, relative to the standardizing of surgical procedure and medical practice, was referred to this committee for action. While the communication proposed the appointment of a standing committee and hence a change in the By-Laws, it dealt with other matters foreign to the work of this committee, and it recommends that it be referred to the Judicial Council.

Respectfully submitted by order of the Reference Committee.

Floyd M. Crandall, Chairman.

Report of Reference Committee on Sections and Section Work

Dr. John D. McLean, Pennsylvania, chairman, presented the following report of the Reference Committee on Sections and Section Work:

The members of the Reference Committee on Sections and Section Work have very carefully studied the report of the Council on Scientific Assembly and have found a diversity of statements in the report. They find no record of any definite recommendations, but have been much impressed with the statement, "We are accused, and the Council on Scientific Assembly believes this is a just criticism, of devoting too much time to scientific work and too little to social enjoyment and getting acquainted with each other."

We find on referring to the program of the Scientific Assembly and to the meeting of the House of Delegates that there are nineteen separate and distinct sections of our association meeting during five days, as follows: House of Delegates, general meetings, scientific exhibits, and sixteen scientific sections. We therefore appreciate the significance of this statement that much time is devoted to scientific work, leaving very little for pleasure and getting acquainted.

We also find that a resolution has been handed to us requesting consideration of the creation of a new section on industrial physicians and surgeons, making additional scientific work. There would then be twenty distinct parts of the association meeting during the five days. We find also, on referring to the program, that there are 562 speakers listed to address the physicians in attendance. This does not include meetings of the House of Delegates or meetings on Wednesday and Thursday evenings.

As a result of all this, we find it impossible to make any definite recommendation to become operative at the next session, and as this involves every member of the Association in attendance, we would recommend that this House of Delegates direct the Council on Scientific Assembly to carefully study this problem and form a definite plan of procedure for future meetings. We would also recommend that the committee be directed to forward the suggested plan of procedure to each member of the House of Delegates, for the next session, at least two weeks prior to the first day of the meeting of the House, and that the report of the Council be submitted to the House of Delegates at the next session for definite action.

The following resolutions have also received consideration:

WHEREAS, Industrial medicine and surgery is rapidly becoming an ortant special field of medicine, and

WHEREAS, The American Association of Industrial Physicians and Surgeons of over 500 members has been in existence for three years, and

WHEREAS, The industrial physicians and surgeons form a group of the profession making a large contribution both to medicine and to the conservation of man power; now be it

Resolved, That the American Medical Association recognize these facts and give their designation of Industrial Physicians and Surgeons to those properly qualifying for this title, and that they be so designated in the Directory of the American Medical Association; and be it further

Resolved, That the Committee on Sections consider the advisability inviting the American Association of Industrial Physicians and Sur- us to become a section of the American Medical Association.

Your Reference Committee would recommend that the first resolution be referred to the Board of Trustees with favorable recommendation, and that the second resolution be referred to the Council on Scientific Assembly for consideration in the proposed plan of procedure to be submitted to the House of Delegates at the next session.

John D. McLean,
Guy L. Connor,
Frederick T. Rogers,
Thomas Holloway,
G. A. Moleen.

It was moved that the report be adopted.

Seconded and carried.

Supplementary Report of the Reference Committee on Reports of Officers

Dr. H. G. Wetherill, Colorado, chairman, presented the following supplementary report for the Reference Committee on Reports of Officers:

As regards the report of the Judicial Council, your Reference Committee agrees that it is inadvisable for the medical profession to depart from its traditional principle, namely, that physicians should not derive pecuniary profit from patents on articles for the relief of the sick. This principle is endorsed and reaffirmed, chiefly because it represents the highest ideals of our profession; but it may be noted also that it is one of the foundations of the confidence of the public in the profession, and one of the chief reasons why funds have been given liberally for medical research. Every discovery of the future utilizes the results of these past gifts, and therefore has obligations toward them.

The case is not quite as clear when profits derived from such patents are to be used for the benefit of the public, and not for private gain. This is permitted by the rule of 1916, under which we are now working; and whether this rule is wise or unwise, it could not fairly be revoked in reference to the present case, since this would constitute retroactive legislation.

It must also be pointed out that the Association has no jurisdiction over the University of Minnesota, and therefore the question of what this university should do or should not do does not seem to be a subject for action by this body.

Under the circumstances, it appears that this body may reply to the request of the University of Minnesota by informing it of its own general policy, as above expressed, and leave the adoption and application of these principles to the university.

Finally, it is to be clearly understood that no member of the medical profession is to derive pecuniary profit from the patent; and that the Reference Committee assumes, without hesitation, that the offer of the Mayo brothers was made in a spirit of altruism.

We therefore recommend that the present status be maintained, under the resolution adopted by the House of Delegates at the Detroit session in 1916, and that a copy of this report and of the report of the Judicial Council be forwarded to the president of the University of Minnesota and to Drs. William J. and Charles H. Mayo.

H. G. Wetherill,
F. E. Murphy,
S. R. Roberts,
Torald Sollmann,
H. B. Gibby.

At the conclusion of the report, Dr. Wetherill moved its adoption.

Seconded and carried.

Report of Committee on Reapportionment

Dr. Edward B. Heckel, Pennsylvania, chairman, presented the following report of the Committee on Reapportionment:

Your Committee on Reapportionment of Delegates presents the following report, in accordance with Article 5, Section 2, of the Constitution, which provides that "the total voting membership of the House of Delegates shall not exceed 150. The Medical Departments of the Army, of the Navy, and the United States Public Health Service, and the Scientific Sections shall each be entitled to one delegate." This leaves 132 to be apportioned to the constituent associations in proportion to their actual membership, which entitled each 800 members or fraction thereof to one delegate. This makes the voting membership of the House of Delegates 145, and according to the Constitution and By-Laws the apportionment will prevail for three years. The number of delegates to which each state is entitled, in accordance with this ratio, is as shown in the accompanying table (see page 1943).

Respectfully submitted.

Edward B. Heckel,
Philip S. Roy,
John Ridlon,
Arthur D. Bevan, President,
Alexander R. Craig, Secretary.

At the conclusion of the report, Dr. Heckel moved that it be adopted, with the proviso that the secretary be authorized to correct any errors in it.

Seconded and carried.

Dr. J. W. Schereschewsky, U. S. P. H. S., chairman, presented the following resolution, which is transmitted from the Section on Preventive Medicine and Public Health, and referred to the Reference Committee on Hygiene and Public Health:

WHEREAS, The health of the nation is a measure of its effectiveness both in peace and in war; and

WHEREAS, The military army of today was the civilian army of yesterday; and

WHEREAS, The necessity for protecting the public health was never more urgent; therefore be it

Resolved, By the House of Delegates of the American Medical Association, that the three Surgeon-Generals of the Army, the Navy and the U. S. Public Health Service, be memorialized as to the necessity for devising means for protecting the integrity of the health organizations of the several states.

Your committee approves this resolution and recommends its adoption by the House of Delegates.

Respectfully submitted by order of the Reference Committee.

J. W. Schereschewsky, Chairman.

A motion to adopt the report was made and seconded.

After discussion by Dr. John D. McClean, Pennsylvania; Dr. J. W. Schereschewsky, U. S. P. H. S.; Dr. S. W. Welch, Alabama, and Dr. Wilmer Krusen, Pennsylvania, it was moved that the resolution be laid on the table.

Seconded and carried.

Dr. Otto P. Geier, delegate from the Section on Preventive Medicine and Public Health, moved that the resolution

presented by the Reference Committee on Hygiene and Public Health, just tabled, be taken off the table.

Seconded and carried.

The resolution was again discussed by Drs. S. W. Welch, Otto P. Geier and John D. McClean, when Dr. Geier moved to amend the resolution by adding to the second part of it the words "maintaining the efficiency and financial support," so that the resolution as amended would read as follows:

> *Resolved*, By the House of Delegates of the American Medical Association, that the three Surgeon-Generals of the Army, the Navy and the United States Public Health Service be memorialized as to the necessity for devising means for protecting the integrity and maintaining the efficiency and financial support of the health organizations of the several states.

Seconded.

After further discussion by Drs. John D. McClean, Pennsylvania, and Dr. Otto P. Geier, the original motion as amended was put and carried.

Dr. E. H. Cary, Texas, moved that a vote of thanks be extended to the resident members and officers of the American Medical Association, and particularly to the Chicago Medical Society, for their hospitality and entertainment of the members of the House of Delegates. Further, that the thanks of the House of Delegates be extended to the ladies of Chicago and citizens for helping to make this meeting so pleasant and enjoyable. Seconded and carried.

Dr. E. Elliot Harris, New York: We all feel a great debt to the Speaker of the House of Delegates for the able manner in which he has conducted the deliberations of this House, and, therefore, I move that a rising vote of thanks be extended to him for his work during this session.

Seconded and unanimously carried.

The members of the House of Delegates, in accordance with the motion made by Dr. Goodwin, then arose and in silence bowed their heads for a few moments in respect to the memory of Dr. E. J. McKnight, late member of the Board of Trustees and of those Fellows and members who have "carried on" in the services of the nation, after which the Speaker declared the House of Delegates adjourned *sine die.*

REGISTRATION AT CHICAGO

The total registration at the Chicago Session was 5,553. Below are given two summaries, one by sections and one by states:

REGISTRATION BY SECTIONS

Practice of Medicine	1,880
Surgery, General and Abdominal	1,417
Obstetrics, Gynecology and Abdominal Surgery	345
Ophthalmology	417
Laryngology, Otology and Rhinology	291
Diseases of Children	222
Pharmacology and Therapeutics	30
Pathology and Physiology	76
Stomatology	29
Nervous and Mental Diseases	157
Dermatology	89
Preventive Medicine and Public Health	152
Genito-Urinary Diseases	119
Orthopedic Surgery	102
Gastro-Enterology and Proctology	71
Registrations without specifying any one section	156
Total	5,553

REGISTRATION BY STATES

AWARDS IN THE SCIENTIFIC EXHIBIT

The Committee on Awards in the Scientific Exhibit made the following awards:

Gold Medal.—The Fort Riley Sanitary Laboratory, Fort Riley, Kan., fifty models of Army sanitary apparatus.

Silver Medal.—Mayo Foundation, Rochester, Minn., exhibit of the work of the Mayo Clinic and Research Laboratory.

Silver Medal.—Dr. David J. Davis, Chicago, investigations of sporotrichosis, including specimens, cultures and pictures.

Certificates of Merit:

United States Department of Agriculture, Bureau of Animal Industry.—Specimens of disease in food animals.

Dr. Henry F. Smyth, Laboratory of Hygiene, University of Pennsylvania.—Industrial dust—charts, photographs and museum specimens.

Dr. Alfred A. Strauss, Chicago.—Stomach and intestinal surgery—operation for sterility in male.

Dr. Leigh F. Watson, Chicago.—Experimental studies of goiter, specimens, photographs and photomicrographs.

Dr. Daniel N. Eisendrath, Chicago.—1. Experimental effects of cholecystectomy. 2. Anatomy of *common* duct region. 3. Specimens of kidney surgery.

SATURDAY, JUNE 22, 1918

THE FOOD OF THE WORKER IN WAR TIME

In The Journal[1] last week, some facts were presented regarding the nutrition of the Army and the rationing of this selected group now comprising far more than a million of our population. Every one admits that it is of supreme importance to secure the highest physiologic well-being of these persons, on whom depends, in so large a measure, the success of our cause in the international crisis. Scarcely less desirable, however, is the preservation of adequate working strength and efficiency in the great group of laborers who, in one field or another, are producing the supplies without which armed forces cannot be maintained in action. Ships and munitions are among the indispensable requisites in the prosecution of the war. Those engaged in the manufacture of such requisites represent persons at hard work. Their dietary needs are therefore a matter of national concern.

Ordinarily the problems here raised would seem of minor significance so far as an adequate income will permit the purchase of the essentials for proper living. But with a world shortage in food, with a constant, yet surely justified demand on our own citizens to save food to the point of self-sacrifice, and with restrictions both economic and legal placed on the ready purchase of certain food commodities, it may well be asked whether a danger of impairment of the unorganized forces of our great army of labor is imminent. Here the experience of our allies may be of service to us; so that, as has often been reiterated in the course of the past year or two, we ought to profit by the knowledge of the failures or successes of the nations across the sea.

An unusually valuable report on the composition of dietaries, with special reference to those of munition workers, has just been published by the National Health Insurance Medical Research Committee[2] in Great Britain. The investigation was conducted by Viscount Dunluce and Capt. M. Greenwood of the Welfare and Health Section, Ministry of Munitions. The organization of the committee, which includes Christopher Addison, A. K. Chalmers, W. Bulloch, F. G. Hopkins, G. R. Murray, Sir W. M. Fletcher and Sir William Leishman as its medical and scientific members, is a guarantee of the presumable value of this inquiry. The committee points out that it usually happens in the progress of scientific knowledge that periods of great activity in the collection of new facts alternate with others of discussion and consolidation. The coming of war caught the study of nutrition in a period of the former kind. The sudden and exceptional demand for practical guidance which sprang from war conditions found many gaps in the body of knowledge actually available for practical use in dietetics. When the food shortage became imminent, physiologists were able in some degree to state in quantitative terms the actual energy consumed in this or that kind of productive work. They were not able, however, to estimate at all fully the adaptability of the human machine. Its demands and its possibilities had been laboriously studied under conditions which circumstances had led us to consider as normal; but exactly how far the machine is capable of being adjusted to other and, presumably, less favorable conditions was less well known.

For the purposes of comparison under the established conditions of environment and dietary habits existing in Great Britain, statistics of working-class diets, collected before the war, are available. They show a steady increase of energy intake with increasing income. The ranges are from 3,000 to 4,000 calories on a man-per-day basis; for these dietaries the protein consumption ranged from under 85 to about 115 gm. In general accord with these figures are further data collected with great care by Miss Ferguson[3] and her collaborators on the diets of forty Glasgow families in 1911-1912 and 1915-1916. The outcome is not widely different from the estimations of the United States Department of Agriculture's Division of Home Economics on the dietaries of American farmers, their rating being placed at about 3,500 calories per man per day and including 100 gm. of protein.

The British compilers admit that it is very difficult to draw general conclusions from such averages. Thus the budgets give no information regarding the use of alcoholic drinks, and although these beverages are not primarily drunk because of their food value, they must be allowed to contribute to the calorific properties of a diet containing them. Still, it does not appear that the prewar statistics demonstrate any necessity for the average working man to consume a diet equivalent to more than 3,500 calories.

Turning to war time conditions, we find available an unusually large series of statistics collected during the spring and summer of 1917 in English hostels and canteens serving the munition workers in various factories. These show the use of 3,463 calories, on the man-per-day basis, as an average of a larger number of dietaries probably than has ever been compiled for a working class population. About 14 per cent. of the calories were furnished by protein, that is, 116 gm. per day. The statistics are, of course, by no means uniform. Only in three hostels out of twenty-two investigated did the energy value of the daily diet sink below 3,000 calories.

[3] Ferguson: Proc. Roy. Soc. Edinburgh, 1917, 37, Part 2, p. 117.

As is now well known, there was a season of acute shortage of potatoes in England last year, and coincidently there was an energetic campaign urging the public to "eat less bread." In addition, sugar was very scarce. As a phenomenon of nutrition among the people, it is interesting to learn, from actual dietary statistics, what was the effect of this pronounced tendency to decrease the intake of carbohydrates in the ration. The contrecoup of this economy, as the British report has expressed it, has been a remarkable increase in the consumption of fat and an appreciable rise in that of protein. The need of energy in some form cannot be thwarted. The consumption of fats was almost doubled, while that of the carbohydrates proportionately declined. The British committee is inclined to question the wisdom of such enforced changes. "Physiologically," it states, "we hold that the departure from a normal diet was undesirable because there are reasons why carbohydrates should bear the brunt of the struggle to provide energy for work." Hence it urged a radical modification of the dietaries then current (1917) in the direction of reducing fat and increasing the carbohydrate utilized. Perhaps it is fortunate that in this country, despite the urgent request to "eat no wheat," emphasis has always been placed by the United States Food Administration, thanks to its scientific advisers, on the substitution of other cereals so as to leave the essential make-up of the dietary unchanged.

A RETROSPECT OF THE CHICAGO SESSION

The sixty-ninth annual session of the American Medical Association, held in Chicago last week, was one of the most important the Association has ever held. This statement is made as the meetings, the exhibits, the addresses and the results of the past week pass in retrospect before us. The House of Delegates considered many topics of current war interest and passed a number of resolutions of important, timely character, conspicuous among them being those on animal experimentation, on universal military training, on welfare work among children, on the use of enemy manufactured pharmaceutic products, and on the work of Surgeon-General Gorgas.

The opening meeting of the Scientific Assembly, held in the Auditorium Theater was greeted by an audience of over 4,500 persons, every seat and available space in the theater being occupied. Unfortunately, many who desired to attend were unable to find accommodations because of late arrival. The music for this session was provided by the Fort Riley Band, which was a conspicuous feature of the annual session, and aided in arousing military enthusiasm. At this meeting, as in all of the night meetings, the medical officers in uniform were seated on the stage, and added military tone and color to the picture.

The scientific programs began on Wednesday and contained numerous papers of military interest, as well as those of a strictly scientific character.

An unusual feature of the session was the replacing of the President's reception by a medical war meeting held in Medinah Temple, the report of which appears elsewhere in this issue. The local committee on arrangements had done notable work in staging this meeting. Every seat in the immense auditorium was filled, over 6,000 persons being present. The speakers were the noted foreign guests, the Surgeon-Generals, the president of Leland Stanford University and Major Alexander Lambert of the American National Red Cross. The enthusiasm of the audience cannot be depicted by words, every speaker and patriotic enunciation being greeted with an ovation. With the introduction of each foreign guest the audience, led by a local choral organization and accompanied by the music of an immense pipe organ and the Fort Riley Band, sang a national song.

On Thursday, practically all of the scientific sections combined in two meetings of the greatest importance to the Army, the profession and the public. These meetings were held in the Auditorium and Studebaker theaters, and concerned the reconstruction and rehabilitation of disabled soldiers and the physical examinations made under the selective service. When the meeting in the Auditorium Theater opened, some 4,000 persons listened attentively to the message brought to them by representatives of the Surgeon-General's Office, of the Red Cross and of foreign nations as to the program for the care of the disabled fighting men in order that they may be returned to a useful civilian life. In the meeting on the selective service, Lieut.-Col. J. S. Easby Smith and Major Hubert Work of the Provost Marshal-General's Office were able to confer with the state aides of the governors of the various states who had been ordered to Chicago for this meeting, and to inform the many physicians representing the 23,000 physicians who are engaged in the work of the local, district appeal, and advisory boards under the selective service law, concerning many points which had not up to this time been made clear to them.

The Thursday night session was again a public, patriotic meeting. The Auditorium was again filled to capacity, the music on this occasion being provided by a detachment of the Great Lakes Naval Training Station Band and by group singing of the audience.

The scientific and commercial exhibits, the former being referred to elsewhere, were open throughout the session and were noteworthy for their practical and military features. The commercial exhibit included practically all of the recently developed foods, pharmaceuticals and mechanical devices resulting from necessities created by the advance of scientific knowledge and the military emergency.

Special arrangements were made for entertaining the medical women who attended the session in large numbers and also for the amusement of women guests. The entertainments included receptions, teas, a musicale, and a visit to the Great Lakes Naval Training Station to attend the dedication of the new Red Cross building. Arrangements had also been made for a visit to the central department Red Cross headquarters and to local merchandise and industrial plants.

To add to the entertainment of the visitors to this session, a medical motion picture show was conducted throughout the session, numerous reels of film lent by the Medical Department of the United States Army being continuously exhibited, including the famous film "Fit to Fight," prepared by the commission on training camp activities. Capt. H. M. Strong, post surgeon at Rantoul, Ill., was permitted to visit the annual session in an aeroplane, and arrived promptly on time in Chicago, being greeted by the Fort Riley Band and by many convention visitors.

The meeting also served to inform many physicians who are about to enter the military service concerning the routine of application and appointment, equipment, assignment to duty, etc. Medical military headquarters were in continuous operation, in charge of medical officers on active duty. Over 600 physicians were given information, supplied with application blanks, and many of them sent directly to the local examiner for physical examination.

The attendance at this session was the largest since the Chicago session of 1908. The total, 5,553, is but a meager 800 less than that of the 1908 session, and when one takes into consideration the fact that about 20,000 physicians are in active military service, that the services of many physicians are continuously needed by civilian communities and industrial institutions, and that railroad rates are comparatively higher than they have ever before been in the history of our country, the attendance at this session may well be said to have been phenomenal. No meeting of the Association has so successfully reached the public as did this sixty-ninth annual session, and the public showed its interest in the session and in the work which the medical profession is trying to accomplish, by attending in large numbers every meeting in which arrangements had been made for it. The local committee on arrangements and the medical profession of Chicago are to be congratulated on the results of this session, and the thanks and appreciation of every Fellow of the American Medical Association is due them.

THE EARLY HISTORY OF BACTERIOLOGY IN THE UNITED STATES

Whenever we are charged, as a nation, with being occupied solely with the life of trade, and the designation of Yankee is used to designate preeminently commercial habits, it is refreshing to turn to the history of science for the truth. Of course, in the earlier days of the United States as a national enterprise the conditions were scarcely favorable for the widespread prosecution of those studies for which the European peoples of the civilized world had been prepared by generations and even centuries of experience. America's intellectual life can at best be measured by decades. How has she progressed in some of the more recently recognized intellectual disciplines? The new science of bacteriology, the outcome of the labors of Pasteur, Lister, Koch and others, was born within the memory of many that are still living. The bacillus of tuberculosis was announced in 1882; the vibrio of Asiatic cholera in 1883; the bacilli of lockjaw and of diphtheria in 1884, the same year that marked the better recognition of the typhoid bacillus, which was really discovered in 1879; in 1894 came the discovery of the bacillus of bubonic plague; and along with this period belongs the finding of the micro-organisms of malaria, sleeping sickness, and several other diseases. In the midst of such developments the newer science of parasitology has found a firmer footing and a novel significance.

We are prone to look abroad for all considerations of guidance in these modern fields. Professor Bergey[1] of the University of Pennsylvania has lately pointed out how early were some of the efforts in this country to present the story of the bacteria. First in the list of early teachers he places the late Prof. T. J. Burrill of the University of Illinois, who introduced the study of the bacteria into his course on the fungi during the seventies. He discovered the organism of pear blight in 1879 and, in the following years, conducted extensive inoculation experiments with this organism on a large orchard of young pear trees, thereby definitely establishing the etiologic relation of the organism of the disease. In 1882, Dr. Burrill published a pamphlet entitled "Bacteria," in which he gives a discussion of the morphology, functions, classification and methods of study — the latter being those of the French school. The classification of the bacteria follows that of Ferdinand Cohn. There is also included a brief description of the bacteria that were then identified.

The late Surgeon-General Sternberg, to whose initiative we owe the appointment of the commission that discovered the mode of transmission of yellow fever by mosquitoes, translated Magnin's work on bacteria in 1880 and published his large manual of bacteriology in 1892. In the Bureau of Animal Industry at Washington, D. C., Salmon began to study the relation of bacteria to animal diseases as early as 1879; and the discovery of the protozoan organism responsible for Texas cattle fever, a classic research which brought prominence to Prof. Theobald Smith, was probably in a sense an outcome of these early endeavors. Before the nineties of the last century, bacteriology was taught systematically in a number of American educational institutions, the enumeration of which would recall many of the prominent investigators of today. Physicians, particularly those of maturer years, are wont to think of bacteriology solely as a branch of pathology or of medicine. The inspection of our scientific institutions shows how inadequate such an assumption is. As Bergey points out, courses in elementary bacteriology are now being given not only to general science students, but also to students in domestic science, agriculture, dairying, water and sewage purification, public hygiene and sanitation, medicine, dentistry, veterinary medicine, pharmacy, the brewing and fermentation industries, food production and preservation, and plant pathology.

THE PATHOLOGY OF "MUSTARD GAS"

Modern gas warfare dates from April, 1915, when the Germans first liberated the abominable cloud of gaseous chlorin on unsuspecting allied forces at the western front. Since then this heinous mode of attack has experienced numerous variations, which have been discussed in The Journal.[1] Meanwhile, methods of defense and protection have also been devised, one succeeding another as rapidly as inefficacy or inferiority was discovered. The respirator has become part of the outfit of the modern soldier in the trenches.

"The use of a gas shell to force a man to put on his mask," says Major Auld, the gas expert of the British Military Mission, in speaking of tear gas shells, "is practically neutralization. If at the same time you can hurt him, so much the better. Hence the change in gas-shell tactics, which consists in replacing the purely lacrimatory substance by one that is also poisonous." Accordingly the Germans developed a plan of gas warfare that not only harasses the enemy but also seriously injures him. Scarcely a year has elapsed since the so-called mustard gas, dichlorethylsulphid, was added to the fighting armamentarium in this capacity. The substance was first made in 1886 by a German chemist, Victor Meyer, who soon recognized its harmful character.

Subsequently the poisonous nature of this compound seems to have attracted little attention in the scientific world until it became one of the weapons of an army. Consequently the knowledge of its toxicology and the pathology of its manifestations has been limited. It should be recalled that the "mustard gas" is in reality a heavy oily fluid sinking below water and not miscible with it, of neutral reaction, having a faint, sweetish, ethereal odor only slightly suggestive of the sulphur compounds, and with a boiling point of 217 C. It thus has properties whereby it can be distributed in the form of a spray on impact of a shell.

From such reports as have been distributed, it appears that the conspicuous symptoms are conjunctivitis, laryngitis, bronchitis and skin burns, all due to the excoriating effect of the substance. The possibility of such complications as pulmonary edema and bronchopneumonia is apparent. Peculiar is the fact that the recognition of the symptoms is usually delayed for a considerable period, sometimes as long as sixteen hours. We are indebted to Warthin and Weller[2] of the Department of Pathology at the University of Michigan for an illuminating study of the skin lesions produced by dichlorethylsulphid. These show that it is an escharotic, specific in its action on the epidermis and tissues of the corium, particularly on the endothelium of the vessels. The lesion is a chemical burn unlike that produced by heat, electricity or the ordinary corrosives, such as sulphuric, nitric and hydrochloric acids, or strong alkalis. Of all these agents, the effects are most closely allied to those of hydrochloric acid, but are much greater in intensity. It differs from a heat burn in the absence of thrombosis, in the greater degree of fluid exudation, in the greater moistness of the affected area, and in the fact that the necrosis as shown by the loss of nuclei requires hours, or even days, for its complete development. The coagulated, shrunken and cooked appearance of the tissues in heat burns is not apparent in the tissues of mustard gas burns. The vessels in the affected area are severely damaged and collapsed, and there is a local anemia in the earlier stages, with a marked fluid exudation and leukocyte migration. The process is nonhemorrhagic and nonthrombosing. In man the necrosis of the epidermis is usually evident in two hours through the hydropic change in the epithelium and early vesicle formation. There is no deep edema. It is confined to the epidermis and to the papillary layer in the early stages.

Numerous observers have pointed out the slow and insidious development of the real damage done by the substance. Warthin and Weller state that the deep penetration of the smallest quantities applied to the surface is a most striking feature. There is an undoubted entrance through the hair follicles and the sebaceous and sweat glands. The slowly progressive character of the necrosis is a specific characteristic, the height of the necrosis being reached from five to ten days after application. This may in part be explained by contraction and death of the vessels, with resulting anemia in the affected area. The painlessness of the lesion is also a marked characteristic.

[1] The Effects of Inhalation of Chlorin Gas, editorial, The Journal A. M. A., Nov. 27, 1915, p. 1921; Gases in Modern Warfare, April 20, 1918, p. 1160.

[2] Warthin, A. S., and Weller, C. V.: The Pathology of the Skin Lesions Produced by Mustard Gas (Dichlorethylsulphide), Jour. Lab. and Clin. Med. 1918, 3, 447.

This may be explained by the edema and degeneration of the nerve endings in the affected portion. The lesions recall a roentgen-ray burn of the skin in that healing is slow, owing probably to the injury of the blood vessels.

Current Comment

THE SCIENTIFIC EXHIBIT

The constant throng of interested visitors to the scientific exhibit throughout the annual session last week bore testimony to its value. The exhibit which attracted most interest was that from the Fort Riley Sanitary Laboratory, consisting of more than fifty models of apparatus constructed in the laboratory. Among these were seven original models designed by Major C. S. Williamson, M. R. C., director of the laboratory. His multiple shelf incinerator is inexpensive to build, simple to operate, and after the initial charge of fuel (a very small quantity) will burn garbage or garbage and feces indefinitely with no further fuel whatever. This exhibit served to emphasize the value of a research laboratory devoted to the sanitary problems of the Army and Navy, and many visitors expressed the hope that such a laboratory with proper equipment would be made a permanent institution in the government service. Other exhibits dealt with sanitary problems in civil life, such as the beautiful charts on malaria by the Prudential Insurance Company of America and the striking exhibit of industrial dust from the Laboratory of Hygiene of the University of Pennsylvania. These served to emphasize the fact that sanitary problems are attracting much attention, and that research work in these lines is yielding valuable information which can be put to practical use with great advantage. Exhibits showing interesting points in surgical technic by Drs. D. N. Eisendrath, Victor D. Lespinasse and Alfred A. Strauss were interesting and stimulating, while those bearing on problems associated with infectious diseases and immunity by Drs. Hideyo Noguchi, E. C. Rosenow and the Mayo Foundation, and Drs. D. J. Davis, Josiah Moore, Leigh Watson and others were of high grade. Admiration was expressed for the magnificent specimens of animal pathology as related to man, prepared by Dr. L. Enos Day of the U. S. Bureau of Animal Industry. The fine collection of historic medical books, letters and similar material exhibited by Dr. Mortimer Frank was a source of pleasure to a great many. The exhibits of the Propaganda Department and of the Chemical Laboratory of the American Medical Association afforded an insight into the practical and expansive work conducted through these activities. Of special interest at this time were the moving pictures showing the methods of graphic instruction used in camps and naval stations. One of the new U. S. motor ambulances was examined with much interest. The success of the exhibit seemed to suggest the direction to be taken by subsequent displays. The absence of extensive collections of pathologic specimens, and the prominence of sanitary subjects was striking. If the scientific exhibit is to be of real educational value it must consist of things graphically emphasizing facts that have a direct interest to those who see them, and it must not consist too largely of technical subjects which interest only a few individuals. Few exhibits attract the attention they deserve or exert their full educational value unless a competent demonstrator is constantly present, and visitors are always especially interested in meeting the person whose work is shown.

ANOTHER CHALLENGE TO THE ANTIVIVISECTIONISTS

The death rate in swine from all diseases for the year ending March, 1918, announced by the United States Department of Agriculture as 42.1 per 1,000, is the lowest in thirty-five years, according to the records kept during that period. The reduction in mortality, in the light of the statistics just published,[1] for previous years shows a sparing of 4,000,000 hogs, equivalent to the consumption of pork and pork products by the entire population of the United States for 1917 for nearly half a month. The marked reduction in the losses of swine for 1918 over preceding periods, in view of the fact that 90 per cent. of these losses are due to hog cholera, indicates clearly the benefit from the combined efforts of state and federal agencies in protecting the farmers against the ravages of this exceedingly fatal disease. Inasmuch as the antivivisectionists are continually decrying the use of protective serums and vaccines with the assertion that they are useless and inhuman, we wonder what new figment of their imagination will be presented to explain away the results so beneficent to our animal neighbors. Or shall we be told bluntly that the government figures are a lie? Perhaps the antivivisectionist loves his pork too well to deny them.

THE PRESIDENT-ELECT, MAJOR ALEXANDER LAMBERT

The president-elect of the American Medical Association, Major Alexander Lambert, M. R. C., U. S. Army, is already en route again to France to resume his duties as medical director for the Red Cross. Major Lambert is a member of a noted medical family. His father, Dr. Edward W. Lambert, an executive of ability, was for forty-five years chief medical adviser of the Equitable Life Assurance Society. This executive ability Major Lambert seems to have inherited to a remarkable degree, as indicated by his achievements. Dr. Lambert was born, Dec. 15, 1861, and received his A.B. from Yale in 1884, his Ph.D. in 1885, and his M.D. degree from the College of Physicians and Surgeons of Columbia University in 1888. After two years' service as an intern in Bellevue Hospital he entered on the active practice of his profession. He became attending physician at Bellevue Hospital in 1894, served as assistant bacteriologist in the New York Health Department from 1894 to 1901, and since 1898 has been professor of clinical medicine in the

---

[1] See weekly News Letter published by the United States Department of Agriculture, Washington, May 29, 1918.

Cornell University Medical College. He has been attending and consulting physician in several New York hospitals, and is recognized especially for his work in circulatory diseases and in the treatment of drug and alcohol addictions. In the American Medical Association he has served in the House of Delegates as a representative of the great state of New York, became a member of the judicial council in 1911, and has been chairman of that body since 1912. As chairman of this council he worked in cooperation with a committee of the Council on Health and Public Instruction in the compilation of much material and in the issuing of notable reports on workmen's compensation and health insurance. In 1917 he became president of the Medical Society of the State of New York. Since 1907 he has been a member of the Medical Reserve Corps of the United States Army; a brief month after the United States entered the war he was ordered to active duty in France as deputy commissioner of war relief of the Red Cross and chief medical adviser of all American Red Cross activities in France and Belgium. His election to the presidency of the American Medical Association is but another recognition of services well rendered with an adequate conception of the duties of a physician to himself, to the public, to the state and to the nation. It does not mark, we are sure, the culmination of an already noteworthy career; it is but the placing of an earnest worker in a position in which he can render still greater service to worthy activities.

ENLISTMENT IN THE MEDICAL RESERVE CORPS

Since the publication in The Journal, June 1, of the survey of the medical profession's war service and the repetition of the call of the Surgeon-General for 5,000 additional medical reserve officers before Jan. 1, 1919, there has been a display of renewed active interest by the medical profession in military service. It cannot be called a revival, because at no time has the interest of the medical profession lapsed. Judging from the large number of inquiries now being received, however, interest is at fever pitch. Hundreds of letters and even telegrams have been received by The Journal asking for information, for application blanks, in fact, asking The Journal to make the decision as to whether or not it was the duty of the individual inquirer to enter the service. In order successfully to inform physicians, The Journal has grouped in a small booklet, "Information Regarding Appointment in the Medical Reserve Corps of the United States Army," a number of short, practical paragraphs relative to method of application, the equipment of officers, government insurance, the customs of the service, and work in the training camps. Copies of this booklet will be sent to physicians on receipt of a stamped addressed envelop. The American Medical Association and The Journal stand willing and ready to do everything possible to aid physicians in their desire to enter the service of our government in any capacity. Inquiries will be cheerfully answered in as reasonable a time as is consistent with the securing of accurate information.

Medical Mobilization and the War

Personnel of the Medical Department

For the week ending June 14, 1918, the personnel of the Medical Department of the Army included:

Medical Corps: 877, including 1 major-general, 65 colonels, 110 lieutenant-colonels, 298 majors and 403 lieutenants.

Medical Reserve Corps: 19,477, including 1,410 majors, 5,245 captains and 12,822 lieutenants. On active duty: 17,763, including 1,345 majors, 4,979 captains and 11,439 lieutenants.

Medical Corps, National Guard: 1,198, including 20 lieutenant-colonels, 255 majors, 188 captains and 735 lieutenants.

Medical Corps, National Army: 284, including 6 brigadier-generals, 56 colonels, 213 lieutenant-colonels and 9 majors.

The Discharges to date are:

	Number	
Causes	M.R.C.	M.C.N.G.
Physical disability	686	53
Inaptitude	263	21
Other branches of service	567	72
Resignations	162	33
Domestic troubles	59	0
Needed by community	50	0
Deaths	84	6
Dismissals	11	3
Duty completed	1	0
No reasons given	14	0
	1,897	188

Red Cross Needs Medical Men Abroad

The American Red Cross needs physicians and surgeons for its work abroad. The Medical Reserve Corps of the Army takes precedence over all other calls but there must be men who, rejected for slight physical disability or for being between 55 and 60 years of age, should be available for the various medical duties of the Red Cross. The teaching staff of the medical schools will not be taken unless with the written permission of the dean. Medical men are wanted for clinical work in medicine and surgery, for administration work, for hospital administration, and for the medical work in the manifold Red Cross activities. All who can go as volunteers, paying all their expenses, should do so to aid the Red Cross; but if this is impossible, the Red Cross is prepared to pay their expenses and, when necessary, to add the salary of a first lieutenant—$160 a month. It will be possible to have men go for work in the Red Cross for eight or nine months abroad and six months home, and again eight months abroad, thus having a rotating service as regards personnel, but a continuous medical service. All applications should be made to Dr. Alfred E. Shepley, Medical Personnel Bureau, Red Cross, Washington, D. C.

Alexander Lambert.

Chief Medical Adviser, Red Cross in France.
4 Place de la Concorde, Paris.

Army School of Nursing to Be Established

In order to provide adequately for the sick and wounded of a future possible army of unlimited size, the Surgeon-General of the Army has been authorized to establish an Army School of Nursing with branch training schools in various selected military hospitals throughout the country. The admission qualifications for young women desiring to attend this school are: age, between 21 and 35, a high school education or its equivalent, and physical and moral fitness. A course leading to a diploma in nursing will be given, should the military hospitals continue for the full period of the usual nursing course; should these hospitals be discontinued, on the cessation of hostilities before the completion of the course, a certificate will be issued which will entitle the holder to credit in a civil hospital for the period spent in the military hospital and for those branches in nursing successfully completed. Thus this Army School of Nursing will provide sufficient nursing service for the military hospitals and, while giving an opportunity to thousands of patriotic women who wish to serve their country in this capacity, it will give training very valuable to the candidates whether or not they take up nursing as a profession. Until otherwise specified, applications may be sent directly to the Army School of Nursing, Office of the Surgeon-General of the Army, Washington, D. C.

Leave of Absence for Medical Officers

Officers of the higher grades in the Medical Department, who have been serving continuously for six months at their desks on department business, will be required to take at least a two weeks' vacation, according to a memorandum which, it is reported, has been sent to the Surgeon-General of the Army by Secretary Baker. The memorandum states that this is necessary in order to retain the high efficiency of the Medical Department.

Camp Upton Base Hospital Issues New Publication

The first issue of a publication entitled *The Cure*, "published in the interests of the base hospital rather often" with the "largest high grade hospital circulation in Camp Upton, N. Y.," has just appeared. It is a four page news issue edited by the enlisted personnel of the Medical Department. The value of such publications in sustaining the interest of the men in the work and in upholding that elusive but most desirable quality, known as morale, can hardly be overestimated.

Special Duty for Enlisted Chemists

As the military service is in great need of chemists, the War Department has notified Army commanders that all enlisted men who are graduate chemists must be assigned to duty where their training can be most fully utilized. Therefore commissioned officers have been directed to ascertain the number of graduate chemists now on duty in their commands and to report their names to the Adjutant-General's Office at Washington, D. C., stating in their report special qualifications for any particular branch of chemical work and whether these chemists are now employed on chemical duties. Chemists now in military service in the United States have been ordered transferred to the nearest depot brigade; those now in depot brigades, or hereafter received by them will be assigned to service by the Adjutant-General's Office. Graduate chemists will be sent overseas only on chemical duties, and will be transferred to the nearest detachment or organization of their corps prior to departure.

MEMORANDUM FOR THE SURGEON-GENERAL OF THE UNITED STATES ARMY*

At a meeting of representatives of well recognized medical schools in Chicago, June 11, 1918, called by the Surgeon-General of the Army, the following Advisory Committee on Medical Schools was chosen to act as representative of the medical schools in cooperation with the Medical Department of the Army: Ray Lyman Wilbur, president of Leland Stanford University, *chairman*; Dr. William J. Means, president of the Association of American Medical Colleges; Dr. Samuel W. Lambert, dean of Columbia University College of Physicians and Surgeons; Dr. J. Whitridge Williams, dean of Johns Hopkins University Medical Department; Dr. Theodore Hough, dean of the University of Virginia Department of Medicine; Dr. John M. Baldy, president of the Pennsylvania Bureau of Medical Education and Licensure, and Dr. N. P. Colwell, secretary of the Council on Medical Education of the American Medical Association, *secretary*.

June 12, this committee met in conference with the Standing Committee on Medical Education of the Medical Department, consisting of Col. F. F. Russell, Col. V. C. Vaughan, Lieut.-Col. W. H. Welch and Lieut.-Col. H. D. Arnold.

It was voted that Dr. W. A. Pearson of Philadelphia and Dr. John K. Scudder of Cincinnati be added to the Advisory Committee on Medical Schools as representatives, respectively, of the American Institute of Homeopathy and the National Eclectic Medical Association.

The following recommendations were unanimously adopted:

It is recommended that only such medical schools as are amply equipped with teachers, laboratory facilities and clinical material be permitted to enter at this time on a plan of continuous sessions.

It is recommended that the Surgeon-General approve of summer sessions for senior students in such well recognized medical schools as, in his opinion, can furnish the instruction without lowering educational standards.

We approve of the following recommendations in the memorandum from the Surgeon-General to well recognized medical schools, dated May 24, 1918:

OTHER PROVISIONS FOR STUDENTS DURING THE SUMMER OF 1918

Provision should be made for all students who have conditions—either entrance conditions or those incurred in the medical course—to remove these conditions before the opening of the fall session. The plan of continuous sessions leaves little opportunity for making up conditions, and students who are left on inactive status must make normal progress with their class.

Please notify your students of the wishes of the Surgeon-General in this matter.

Students with remediable physical defects should be urged to have these removed during the coming summer. The desirability of thus saving time, and of securing a more complete recovery before active service, is obvious.

Students who must earn money in order to continue their medical education may be allowed to do this during the summer of 1918.

Students who are not provided for by the foregoing arrangements should devote the vacation period to clinical or laboratory work which would better fit them for the duties of medical officers. Schools which cannot organize complete courses for all classes in the school can render valuable service by organizing special courses for some of these students.

It is not practicable for the Medical Department to organize summer military training this year for medical students on an extensive scale.

By these arrangements every medical student on inactive status in the Medical Enlisted Reserve Corps may utilize the summer in active preparation for better service as a medical officer. It is believed that no patriotic enlisted man will be satisfied to take a long vacation when his drafted relatives and friends are in active military service.

FRESHMAN CLASS

Those medical schools which have heretofore held regular summer sessions will, of course, be permitted to continue the admission of students to the freshman class at this time. Schools which adopt the continuous session plan to begin this summer may organize a freshman class to begin the course between June 1 and July 1, 1918.

Well recognized medical schools are authorized to begin matriculation of the freshman class of 1918-1919 at once, whether the next session begins this summer or in the fall. A bona fide matriculation will be accepted as establishing membership in the class, as affecting eligibility for enlistment in the Medical Enlisted Reserve Corps.

ENTRANCE REQUIREMENTS

Permission to enlist in the Medical Enlisted Reserve Corps must now be obtained from the Surgeon-General's Office for each individual case.

Such permission will be granted in the case of medical students, who matriculate in the freshman class of the regular medical course, only when the dean's affidavit shows that matriculation has been based on acceptable credentials which meet the following entrance requirements:

The full completion of fourteen units of secondary education, and, in addition, studies of collegiate grade as follows:

1. In those schools which are members of the Association of American Medical Colleges, at least sixty semester hours of college premedical work in a well recognized university, college, or medical school, including at least twenty-four semester hours in chemistry, biology and physics. Credit for at least ten of these twenty-four hours must be for laboratory work, and there shall be credit for at least six semester hours in each of the three sciences of chemistry, biology and physics.

2. In those schools which now require at least two years of college work for entrance, the same requirements, whether members of the Association of American Medical Colleges or not.

3. In those schools which are not members of the Association of American Medical Colleges, and have not heretofore required two years of college work for entrance and have not announced a two year entrance requirement for the session of 1918-1919, at least thirty semester hours of college work of which at least eight semester hours are in chemistry, eight in biologic sciences, and six in physics; and of these at least four semester hours shall be for laboratory work in Chemistry, at least four in biologic sciences, and at least two in physics. All these specifications must be fully met without any conditions and all must be collegiate work.

LIMITATIONS OF NUMBERS

While it is desirable to train as many medical students as possible, and all good schools should be encouraged to accept students to the limit of their capacity, it is also essential that enlisted medical students should obtain an adequate professional training in preparation for the duties of medical officers.

Unless they can obtain such satisfactory training, the Surgeon-General will not be justified to leave them on inactive status. Therefore the number of students admitted to the freshman class should be limited to a number agreed on after conference with the Surgeon-General's Office.

Preference in matriculation should be given to candidates who are already members of the Medical Enlisted Reserve Corps.

Preference next should be given to those who appear to be eligible to become medical officers on graduation. The question of physical fitness should receive consideration. The following facts in regard to nationality affect the problem: A person must be a full citizen in order to receive a commission, and will not be granted a commission if born in an enemy country, whether a citizen or not. Approval for enlistment, therefore, will not be given to those born in enemy countries, nor to other foreign born students unless they have taken out first naturalization papers.

---

* Published by request of Surgeon-General Gorgas.

The admission of students who are not eligible for a commission in the Army is not forbidden; but attention is called to the importance of first providing places for *all* who are eligible for military service.

It is recommended that when and where feasible the Surgeon-General shall arrange for active military service for medical students during the summer vacations, with the object of shortening the time for completing their training as medical officers.

It is recommended that the Surgeon-General consider as "well recognized medical schools" only those which enforce as a minimum requirement for admission, two years of college work, including courses in physics, chemistry and biology.

It is recommended that the teaching forces of the schools, as well as the students, be included in the Student Army Training Corps, and that the teachers of all subjects who are otherwise eligible shall be commissioned with suitable rank in that corps.

It is recommended that eligible members of the faculties of well recognized medical schools be commissioned with suitable rank in said corps, and that a sufficient number of these officers be assigned to duty in medical schools with periods of service long enough to provide for the efficient teaching of the medical students. Where feasible, it is desired that such officers alternate in active duty between service with the troops and teaching in medical schools.

It is further recommended that all students who are members of the Medical Enlisted Reserve Corps and the commissioned members of the faculty be required to wear uniforms. It is recommended also that similar provision be made for commissions and uniforms for nonmedical members of the faculties of well recognized medical schools.

Major departments in a medical school cannot be considered as adequately organized unless at least one competent man be retained in addition to the head of the department who can assume his duties.

It is recommended that teachers of medical schools inform themselves of the special application of their subjects to problems of war, and, so far as practicable, include such topics and application in their courses of instruction, always bearing in mind that they are training men for service in the Army; and also consider the feasibility of an interchange between different schools of teachers possessed of this knowledge.

The committee calls special attention to the importance of continuing research work in our medical schools and of providing sufficient personnel for this purpose.

It is recommended that the machinery for carrying out these recommendations be in the office of the Surgeon-General in conference with the dean or other anthorized representatives of the medical schools.

The committee voted to present the same recommendations to the Surgeon-General of the Navy, with the suggestion of the desirability of the adoption of the same measures as far as possible.

F. F. Russell, Colonel M. C., N. A.,
Chairman of the Standing Committee on Medical Education of the Medical Department of the United States Army.

Ray Lyman Wilbur,
Chairman, Advisory Committee on Medical Schools.

DISEASE CONDITIONS AMONG TROOPS IN THE UNITED STATES

From Telegraphic Reports Received in the Office of the Surgeon-General for the Week Ended June 7, 1918

1. ANNUAL ADMISSION RATE PER 1,000 (disease only):		Last Week
All Troops	1056.1	974.5
Divisional Camps	1135.3	757.8
Cantonments	975.6	1098
Departmental and Other Troops	1101.1	979.4
2. NONEFFECTIVE RATE PER 1,000 ON DAY OF REPORT:		
All Troops	37.8	36.8
Divisional Camps	36.8	31.7
Cantonments	42.2	43.1
Departmental and Other Troops	33.6	32.7
3. ANNUAL DEATH RATE PER 1,000 (disease only):

To Camp Wheeler, Macon, Ga., for temporary duty, from Fort Oglethorpe, Lieut. JOHN M. CONNOLLY, Philadelphia.

To Camp Zachary Taylor, Louisville, Ky., as orthipedic surgeon, from Philadelphia, Lieut. HOWARD S. MYERS, *Pittsburgh.*

To Fort McPherson, Ga., base hospital, from Camp Meade, Lieut. DON D. BROOKS, Connellsville; from Camp Sevier, Lieut. SAMUEL B. STURGIS, Philadelphia.

To Fort Oglethorp[illegible] MYER SOLIS COHEN, Philadelphia; Lieut. [illegible] Philadelphia, CLARENCE J. McCULLOUGH, [illegible] *erdeen, Md., Lieut.* WILLIAM C. REESE, [illegible] iladeljhia, Lieut. ALBERT T. RANSOME, Philadelphia.

To Fort Screven, Ga., for duty, Capt. ARTHUR C. MORGAN, Philadelphia.

To Hamilton and Toronto, Ontario, Can., [illegible] completion *to his proper station*, Major ISAAC [illegible]

To Hoboken, N. J., base hospital, Lieut. BEN[illegible] Philadelphia; from Camp Meade, Lieut. JACC[illegible] For duty, from Army Medical School, Lieu[illegible] Geneva; from Camp Grant, Lieut. THOMAS [illegible]

To Mineola, L. I., N. Y., Signal Corps Aviation School, for duty, Lieuts. HAROLD F. LANSHE, Allentown; HARRY W. BACHMAN, Philadelphia.

To New Haven, Conn., Yale University, for duty, from Camp Leach, Capt. JOSEPH LEIDY, Philadelphia. For duty, Capt. ISAAC H. ALEXANDER, Pittsburgh; from Fort Oglethorpe, Lieut. HAROLD W. KINDERMAN, Philadelphia.

To Newport News, Va., for duty, Lieuts. VICTOR K. MARSTELLER, Bethlehem; EDGAR C. NIEBAUM, Pittsburgh.

To New York City, [illegible] for instruction, from Camp Jackson, Major EV[illegible] Pittsburgh. School for Military Roentgenology, [illegible] on completion *to his proper station*, from Fort Oglethorpe, Major WILLIS F. MANGES, Philadelphia.

To Plattsburg Barracks, N. Y., for duty, from Cape May, Lieut. CLARENCE A. PATTEN, Philadelphia.

Resignation of Capt. EDWARD B. GLEASON, Philadelphia, accepted.

The following order has been revoked: *To Hoboken, N. J.*, for duty, Capt. ISAAC H. ALEXANDER, Wilkinsburg.

Porto Rico

To Camp Las Casas, San Juan, P. R., for duty, Lieut. AMNUEL F. NATER, San Juan.

Rhode Island

To Camp McClellan, Anniston, Ala., base hospital, from Army Medical School, Lieut. EDWARD W. MULLIGAN, Providence.

To Camp Sherm[illegible]se hospital, from Camp Doniphan, Capt. HC[illegible] Providence.

To Portland, Ore[illegible] from Lake Charles, La., Lieut. KENNETH [illegible]

To Rockefeller Institute for instruction in the treatment of infected wounds, and on completion *to Fort McHenry, Md.*, for duty, Capt. WILLIAM B. CUTTS, Providence.

South Carolina

To Camp Crane, Allentown, Pa., base hospital, from Camp Jackson, Capt. WILLIAM H. JOHNSON, Charleston.

To Camp Hancock, Augusta, Ga., base hospital, from Camp Lee, Lieut. RALPH H. McFADDEN, Chester.

To Camp Jackson, Columbia, S. C., for duty, Lieut. WILLIAM H. MATHIS, Collins; from Williamsbridge, Lieut. LADSON D. BOONE, Charleston.

To Camp Travis, Fort Sam Houston, Texas, as assistant to camp surgeon, from El Paso.

To Fort McHenry, Md., for duty, from Camp Meade, Lieut. WILLIAM R. JOHNSON, Windsor.

To Hoboken, N. J., for duty, from Army Medical School, Lieut. COLLINS E. SMITH, Ridgeville.

South Dakota

To Camp Travis, Fort Sam Houston, Texas, for duty, Lieuts. ARCHIE P. KIMBALL, Colome; GEBBARD J. LONG, Oldham.

To Milwaukee, Wis., base hospital, from Camp Zachary Taylor, Lieut. CARL N. HARRIS, Wilmot.

To Portland, Ore., Yeon Building, for duty, from Camp Greene, Lieut. HARLEY D. NEWBY, Parker.

To San Francisco, Calif., for duty, Capt. ALFRED C. ALLEN, Deadwood.

Tennessee

To Camp Dix, Wrightstown, N. J., base hospital, from Fort Riley, Lieut. PERCY D. BIDDLE, Columbia.

To Camp Dodge, Des Moines, Ia., base hospital, from Camp Travis, Lieut. ELMER S. MAXWELL, Nashville.

To Camp Gordon, Atlanta, and *Camp Forrest*, Chickamauga Park, Ga., for duty, from Camp McClellan, Capt. LEE A. STONE, Memphis. *To Camp Gordon* for duty, Capt. EDWARD T. WEST, Johnston City; Lieut. JAMES H. JONES, Hampshire; from Fort Oglethorpe, Lieut. VIRGIL E. MASSEY, Knoxville.

To Camp MacArthur, Waco, Texas, as orthopedic surgeon, from Philadelphia, Lieut. BEECHER L. OGLE, Knoxville.

To Camp Travis, Fort Sam Houston, Texas, for duty, Lieut. JOHN B. CROSS, Wheat.

To Camp Wadsworth, Spartanburg, S. C., and *Camp Hancock*, Augusta, Ga., for duty, from Camp Forrest, Capt. LEE A. STONE, Memphis.

To Portland, Ore., Yeon Building, for duty, from Lonoke, Ark., Capt. CHARLES W. BROWN, Nashville; from Fairfield, Ohio, Lieut. HUGH W. ALLAN, Knoxville.

To Rockefeller Institute for instruction in laboratory work, and on completion *to Army Medical School* for duty, Lieut. DURWARD B. ROACH, Nashville.

To Washington, D. C., for duty in the Surgeon-General's Office, from Camp Meade, Major EDWARD C. ELLETT, Memphis.

Resignation of Major MATTHEW C. McGANNON, Nashville, accepted.

The following orders have been revoked: *To Fort Oglethorpe* for instruction, Capt. DAVID R. NEIL, Nashville. *To Pittsburgh, Pa.*, Carnegie Building, for instruction, and on completion *to their proper stations*, from Camp Sherman, Lieuts. JOHN S. MILLER, Colliersville; THOMAS W. MENEES, Nashville.

Texas

To Army Medical School for instruction, from Camp MacArthur, Capt. EUGENE V. POWELL, Fort Worth; from Camp Devens, Lieut. ERNEST J. STEVENS, San Antonio.

To Camp Beauregard, Alexandria, La., base hospital, from Camp Cody, Capt. THOMAS C. BROOKS, Bay City.

To Camp Bowie, Fort Worth, Texas, base hospital, from Camp Travis, Lieut. THOMAS T. JACKSON, San Antonio.

To Camp Devens, Ayer, Mass., base hospital, from Fort Riley, Lieut. MELVIN O. REA, Dallas.

To Camp Doniphan, Fort Sill, Okla., as orthopedic surgeon, from Philadelphia, Lieut. CARL B. YOUNG, Jr., Houston.

To Camp Kearny, Linda Vista, Calif., base hospital, from Camp Cody, Lieut. WILLIAM T. DUNNING, Gonzales.

To Camp MacArthur, Waco, Texas, base hospital, from Army Medical School, Lieut. GEORGE M. JONES, Smithville. For duty, Lieuts. AUGUST J. STREIT, Marlin; LEWIS S. JOHNSTON, San Antonio.

To Camp Pike, Little Rock, Ark., for duty, from Army Medical School, Lieut. HUBERT L. BROWN, Sherman.

To Camp Travis, Fort Sam Houston, Texas, base hospital, from Camp Cody, Capt. MILES J. DUNCAN, Dallas. For duty, Lieuts. ROGERS W. McKEAN, Fort Worth; OSCAR M. DILLEN, Lufkin; FRED A. [illegible]LIN, San Antonio; HENRY C. BAILIFF, EDWARD E. YEAGER, Temple.

To Fort Bliss, Texas, for temporary duty, from Camp MacArthur, Capt. DAVID H. LAWRENCE, El Paso.

To Fort Oglethorpe for instruction, from *Camp Hancock*, Lieut. JOHN C. THOMAS, Taylor; from *Camp Logan*, Lieut. JOSEPH E. McDOWELL, Shamrock; from Everman, Texas, Lieut. JOSEPH H. HICKS, Elkhart.

To Fort Sam Houston, Texas, base hospital, from Fort Douglas, Lieut. EDWARD J. BURUS, Carrizo Springs.

To Hoboken, N. J., for duty, from Camp Cody, Lieut. CHARLES C. COOKE, Keene; from Fort Oglethorpe, Lieut. PERE M. KUYENDALL, Moody.

To Houston, Texas, Signal Corps Aviation School for duty, from West Point, Lieut. ERASTUS B. WHEAT, Cooper.

To Portland, Ore., Yeon Building, for duty, from Camp Dick, Lieut. LYLE G. THORNTON, West Point; from Camp Greene, Lieut. EDW. J. BURNETT, San Antonio; from Houston, Lieut. HOMER T. ELKINS, Sinton.

To report to the Commanding general, Philippine Department, for duty, from Camp MacArthur, Lieut. JOHN W. BROWN, Pearsall.

To San Antonio, Texas, Signal Corps Aviation School, for duty, from Mineola, Lieut. WILSON M. BASSETT, San Antonio.

To West Point, Miss., Signal Corps Aviation School, for duty, from San Antonio, Capt. WILLIAM R. JAMIESON, El Paso.

Utah

To Dallas, Texas, for duty, from Mineola, Capt. ROBERT R. HAMPTON, Salt Lake City.

To report by wire to the commanding general, Western Department, for assignment to duty, Lieut. REINHOLD KANZLER, Ogden.

Vermont

To Hoboken, N. J., for duty, from Fort Oglethorpe, Lieut. WILLIAM A. FLOOD, North Bennington.

To Camp Leach, Washington, D. C., for duty, Lieut. CLAIBORNE WILCOX, Norfolk.

To Camp Lee, Petersburg, Va., base hospital, from Camp Sevier, Capt. WILLIAM B. PORTER, Richmond. For duty, from Fort Oglethorpe, Lieut. WALTER D. SIMMONS, Richmond.

To Fort Oglethorpe for instruction, Lieut. JAMES McN. FADSLEY, Falls Church.

To New Haven, Conn., for duty, Lieut. JAMES L. STRINGFELLOW, Norfolk.

To report to the commanding general, Philippine Department, for duty, from Camp Custer, Lieut. ARTHUR HOOKS, Blackstone.

Washington

To Camp Fremont, Palo Alto, Calif., base hospital, from Camp Kearny, Capt. COPELAND PLUMMER, Seattle.

To Fort Oglethorpe for instruction, from Fort Riley, Lieut. LORENZO S. DEWEY, Okanogan.

To Hoboken, N. J., base hospital, from Mayo Clinic, Lieut. HUBBARD T. BUCKNER, Seattle.

To Philadelphia, Pa., University Hospital, for instruction, and on completion *to his proper station*, from Camp Meade, Lieut. WHITTING B. MITCHELL, Sumner.

To Portland, Ore., Yeon Building, for duty, from Houston, Major ROBERT A. ALLEN, Tacoma; *from Anchorage, Alaska, Lieut.* CHAS. C. BENEDICT, Seattle.

To San Diego, Calif., Signal Corps Aviation School, as flight surgeon, from Mineola, Capt. RICHARD W. PERRY, Seattle.

West Virginia

To Arcadia, Fla., Signal Corps Aviation School, as flight surgeon, from Mineola, Capt. WILLIAM W. GILL, Richmond.

To Camp Gordon, Atlanta, Ga., for duty, Lieut. SAMUEL B. NICKELS, Big Stone Gap.

To Boston, Mass., Franklin Union Training Detachment, for duty, Lieut. ULYSSES G. ARNETT, Henderson.

To Camp A. A. Humphreys, Accotink, Va., *for duty, from* Fort Oglethorpe, Capt. McRAE C. BANKS, Raleigh.

To Camp Gordon, Atlanta, Ga., for duty, Lieut. RICHARD L. DEVEREUX, Wheeling.

To Camp Grant, Rockford, Ill., base hospital, from Army Medical School, *Lieut.* JOHN P. FARSON, Century.

To Camp Jackson, Columbia, S. C., *for duty*, Lieut. HERSCHEL R. YOST, Fairmont.

To Camp Pike, Little Rock, Ark., base hospital, from Army Medical School, Lieut. SOLOMON L. CHERRY, Clarksburg.

To Camp Upton, L. I., N. Y., with the board examining the command for nervous and mental diseases, Capt. CECIL DENHAM, Buckhannon.

To Newport News, Va., for duty, Lieut. EDGAR W. SMOOT, Glendenin.

Wisconsin

To Camp Devens, Ayer, Mass., as assistant to the camp surgeon, from Hoboken, Major E. J. BARRETT, Sheboygan.

To Camp Grant, Rockford, Ill., base hospital, Lieut. TIMOTHY J. HOWARD, Milwaukee.

To Portland, Ore., Yeon Building, for duty, from Arcadia, Lieut. CHARLES F. REHLING, Fremont.

To report to the Commanding general, Philippine Department, for duty, from Camp Custer, Lieut. MARTIN DuFRENNE, Middleton.

To Washington, D. C., for duty, and on completion *to his proper station*, from Cape May, Capt. J. GURNEY TAYLOR, Milwaukee.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest; such as relate to society activities, new hospitals, education, public health, etc.)

CALIFORNIA

Health Subsidy Restored by State.—On being informed that $5,000 has been appropriated for the maintenance of a tuberculosis ward at the San Francisco Hospital, and that the board of supervisors have voted to select a site for a new tuberculosis sanatorium, the state board of health has restored the state subsidy to the San Francisco Hospital.

Personal.—Dr. Robert A. Peers, Colfax, who resigned recently from the state board of health to enter military service, has arrived in France.——Dr. William L. Whittington, Santa Rosa, has been appointed first assistant physician at the Sonoma State Home.——Dr. James G. Baird has resigned as a member of the board of health of Riverside.——Dr. John P. Gilmer has resigned as police surgeon at the Receiving Hospital, Los Angeles, to enter the Naval service and has been succeeded by Dr. Clayton G. Stadfield.——Dr. Charles W. Girdlestone has resigned as health officer of Riverside.——Dr. Placida Gardner, city bacteriologist of Los Angeles, has started for France.——Dr. Carl P. Jones, Grass Valley, has accepted the directorship and organization of Naval Station Hospital Unit No. 11.

GEORGIA

Cancer Committee Appointed.—At the meeting of the State Medical Association of Georgia in April, a committee was appointed to educate the public and call the attention of the profession to the increasing danger of cancer. The committee is composed of twelve members, one from each congressional district of the state. Dr. James L. Campbell, Atlanta, is chairman.

ILLINOIS

Violators of Practice Act Convicted.—The department of registration and education reports that it has recently secured convictions for violations of the medical practice act in the following cases:

Martin Krause, Chicago. Fined $100 and costs.
Philip H. Griggs, Jacksonville. Fined $50 and costs.
Mrs. Ella Brown, Hillsboro. Fined $75 and costs.
Mrs. Emma Calvin, Monticello. Awaiting sentence.
H. N. Mettler, Rock Island. Fined $200. Appealed to Supreme Court
D. Cecilio, Witt. Fined $50 and costs.
George Granthau, Irving. Fined $50 and costs.
J. J. Vizgird, East St. Louis. Fined $200 and costs.
Dora Dennis, East St. Louis, Fined $75 and costs.
J. W. McClellan, East St. Louis. Fined $50 and costs.
Joseph R. Kloppenburg, East St. Louis. Fined $50 and costs.
A. P. Milliken, Somonauk. Fined $25 and costs.
S. Hirschfield, Chicago. Fined $100 and costs.
James Brown, Springfield. Fined $50, with thirty days in jail.
L. G. Lewis, Galesburg. Fined $25 and costs.
C. E. Brandt, Bushnell. Fined $25 and costs.
Wm. B. Wilson, Hoopeston. Fined $25 and costs.
R. R. Roberts, Chicago. Fined $50 and costs.
R. Langfields, Chicago. Fined $100 and costs.
C. Claybourn, Centralia. Fined $150 and costs.
J. J. McCue, Springfield. Fined $25 and costs.
Johann Henrich Wilhelm Harmsen, Chicago. Fined $25 and costs.
W. L. Myers, Bushnell. Fined $25 and costs.
Barbara Glaum, Chicago. Fined $150 and costs.

The following cases are pending:

L. Brodawicz, East St. Louis. Held to circuit court; $1,000 bond.
F. C. Shaklee, Galesburg. Held for action of grand jury; $300 bond.
E. S. Spaulding, Cairo. Held for action of grand jury; $300 bond.

Chicago

Election of Officers.—At the annual election of the Chicago Medical Society, held June 18, the following officers were elected: president, Dr. John V. Fowler; secretary, Dr. Hugh N. MacKechnie.

INDIANA

College News.—Contracts for the erection of a new building for the Indiana University School of Medicine, Indianapolis, on the grounds of the Robert W. Long Hospital, were awarded at a recent meeting of the trustees. Plans to continue the Indiana School of Medicine without vacation have been announced by the registrar of the institution.

City Health Board Changes.—Drs. Thomas B. Eastman, Robert O. Alexander, Willis D. Gatch, all of Indianapolis, have resigned as members of the city board of health and charities on request of the mayor. Dr. Gustavus B. Jackson, president of the board, has resigned to enter military service. Drs. James C. Carter and Harry E. Gabe have been appointed members of the board.

IOWA

Personal.—Dr. Guilford H. Summer, Des Moines, secretary of the state board of health, has been unanimously reelected to the position for a term of five years.——Dr. George S. Muirhead, Marion, was operated on for cholecystitis, May 24, at Mercy Hospital, Cedar Rapids, and is reported to be doing well.——Dr. David M. Ghrist, Ames, was seriously injured in an interurban wreck near Boone, May 9, and is under treatment in the Mary Greeley Hospital.

MARYLAND

Service Flag.—A service flag bearing twenty-six stars has been suspended between the two buildings of the Shepherd and Enoch Pratt Hospital, near Touson.

Government Not to Buy Quarantine Station.—On account of the enormous demands upon the federal treasury for war purposes, the House committee on appropriations has refused to consider the expenditure at this time of $176,000 for the purchase of the Baltimore city quarantine station and its equipment, which had been recommended by the United States Public Health Service. The Baltimore quarantine is the only one of the city and state maintained quarantine services which the federal government has not taken over and made a part of its federal quarantine system. Assistant Surg.-Gen. Richard H. Creel stated before the committee that the Baltimore quarantine service is satisfactorily maintained by the city at a cost of about $24,000 a year. This the Public Health Service believes the government can reduce to $10,000 or $12,000. The quarantine service was turned over to the government by the city a few weeks ago at a rental of $1 a year, pending action on the congressional appropriation. The intention of the city officials was to use the money from quarantine in establishing a new municipal hospital in the western part of the city.

Personal.—Major Alfred P. Roope of the Medical Reserve Corps has arrived at General Hospital No. 2, Fort McHenry, from Camp Lee, Va. There are now in the hospital about 300 patients.——Dr. Charles A. Reifschneider, Medical Reserve Corps, medical superintendent of the University Hospital, has been ordered to Camp Meade, Md. He has been assigned to Evacuation Hospital No. 19. Dr. Harry Schmuck, Baltimore, has been made superintendent of the hospital in place of Dr. Reifschneider.——Dr. J. Carroll Monmonier, Catonsville, captain in the hospital corps, who has been for some months in France, has been made chief of the medical and sanitary staff of one of the hospitals near the front, having been transferred from the aero squadron to which he was attached.——Dr. C. Frank Jones, a health warden of Baltimore city, is recovering from an operation performed at St. Joseph's Hospital. Dr. Jones was city diagnostician during the outbreak of infantile paralysis two years ago.——Dr. Luigi D. Stefano has been appointed health warden of the fifth ward of Baltimore, succeeding Dr. Joseph E. Heard, deceased.——Dr. Edward P. Smith, superintendent of Mercy Hospital, Baltimore, resigned, May 29.——Dr. George Y. Massenburg has returned to Baltimore after eight months' service with the Roumanian Red Cross.——Dr. H. G. Tonkin has been elected mayor of Martinsburg.——Dr. Mildred Jencks, who will sail for China in August to become resident physician of the David Gregg Hospital for Women and Children, was the guest of honor at an informal reception held in the Brown Memorial Church, May 7.

MASSACHUSETTS

Laboratory for Cancer Research.—A new laboratory building for the Huntington Memorial Hospital for Cancer Research, Boston, is to be erected at an estimated cost of $6,000, one third of which has already been obtained.

Sentence Confirmed.—It is reported that the state supreme court has decided that Dr. Lemuel F. Noble, Roxbury, Boston, must serve a term of eighteen months at Dear Island; this sentence was imposed by the superior criminal court a year ago, when he was found guilty on ninety-six counts of an indictment charging the unlawful prescribing of narcotic drugs.

Personal.—Dr. Albert M. Shattuck, Worcester, has succeeded Mr. Perreault as trustee of the Grafton State Colony. ——Dr. William H. Coon, formerly of Wakefield, has resigned as director of public health of St. Louis, in order to accept a position of director of health and sanitation of the Federal Ship Building Board.——Dr. Frank C. Richardson, *Brookline*, who has been seriously ill with neuritis, is reported to be improving.——Dr. Ernest V. Scribner, Worcester, is a patient at the Peter Brent Brigham Hospital, Boston.——Dr. Arthur W. Gilbert, secretary to the committee on agriculture of the Boston Chamber of Commerce, has been appointed milk administrator for New England by the New England Regional Milk Commission.——Dr. Ada F. Harris, Worcester, has been appointed pathologist of the Massachusetts State Hospital, Grafton.

District Society Meetings.—Franklin District Medical Society elected officers at Springfield, May 14, as follows: president, Dr. Charles Moline, Sunderland; vice president, Dr. John A. Mather, Colerain; secretary, Dr. Frank A. Millett, Greenfield.——Bristol South District Medical Society at New Bedford, May 9: president, Dr. Joseph A. Barre, Fall River; vice president, Dr. Edwin D. Gardner, New Bedford; secretary-treasurer, Dr. Alanson J. Abbe, Fall River.——Worcester District Medical Society at Worcester, May 8: president, Dr. William L. Johnson, Uxbridge; vice president, Dr. William J. Delahanty, Worcester; secretary, Dr. George A. Dix, Worcester; treasurer, Dr. George O. Ward, Worcester. ——South Essex District Society at Nahant, May 7: president, Dr. John J. Egan, Gloucester; vice president, Dr. Carolus M. Cobb, Lynn; secretary, Dr. Hamlin P. Bennett, Lynn; treasurer, Dr. George Z. Goodell, Salem.

Faculty Changes.—At the last meeting of the board of overseers of Harvard University, Dr. Richard C. Cabot was made clinical professor of medicine; Dr. Eugene A. Crockett, Le Compt, professor of otology; Dr. Franklin S. Newell, Boston, clinical professor of obstetrics; Dr. William Worth Hale has succeeded Dr. McIver Woody, Boston, as secretary of the medical faculty; Dr. Edwin A. Locke has been appointed assistant professor of medicine; Drs. Fritz B. Talbot and Charles H. Dunn, Boston, instructors in pediatrics; Dr. Robert M. Green, instructor in anatomy; Dr. Calvin G. Page, instructor in bacteriology; Dr. Frederick E. Jones, instructor in dermatology; Dr. Ernest W. Goodpasture, instructor in pathology, and Edward A. Boyden, instructor in comparative anatomy. Dr. Alexander Quackenboss has been granted leave of absence to enter government war work. Drs. Martin J. English, assistant professor in medicine; Horace K. Sowles, alumni assistant in surgery; Francis M. Rackemann, assistant professor of medicine, and James B. Ayer, instructor in anatomy, have resigned. The following appointments have been made: Dr. William A. Perkins, alumni assistant in surgery; Dr. Algernon Coolidge, acting dean of the graduate school of medicine; Dr. William B. Robbins, alumni assistant in medicine; Dr. William N. Souter, Portsmouth, N. H., instructor in ophthalmology.

MISSOURI

Prosecution of Midwives.—The second successful prosecution of a midwife for negligence and failure to report and properly to care for a case of ophthalmia neonatorum, undertaken by the Missouri Commission for the Blind, St. Louis, resulted in the imposition of a fine of $25 on Mrs. Ida Diamant, a local midwife. The prosecution was made through the St. Louis Department of Health. The midwife had failed to report a case of ophthalmia neonatorum. The baby lost one eye; the other was saved by skilful medical attention.

NEBRASKA

Medical School Not Recognized.—It is reported that the Nebraska State Board of Health has endorsed the action of the advisory board in refusing to permit graduates of the Lincoln Medical College to take the examination for the practice of medicine in that state. It was claimed that the medical school has not conformed to the requirements of the state law.

Personal.—Dr. Harris A. Newell, Marshalltown, Iowa, has been appointed first assistant physician at the Lincoln State Hospital, succeeding Dr. Frank S. Marnell, promoted to the position of assistant superintendent.——Dr. Edward Bollinger, first assistant physician at the Hastings State Hospital, has resigned.——Dr. Laureston A. Merriam, Omaha, was struck by an automobile, May 26, and sustained serious injuries.——Dr. Ernest T. Manning has been appointed health commissioner of Omaha.——Dr. Michael J. Ford, Omaha, who has been ill with pneumonia for six weeks, has recovered.

NEW YORK

Personal.—Canisius College has conferred on Dr. William G. Bissell of Buffalo the honorary degree of Doctor of Laws.——Dr. Joseph B. Ringland, Oswego, has been elected president; Dr. Edward J. Wynkoop, Syracuse, vice president, and Dr. Herman G. Weiskotten, Syracuse, secretary, of the Syracuse University College of Medicine Alumni Association.

Free Milk for Babies.—Five new milk stations have been added to the eight that are maintained all the year around by Nathan Strauss. These stations will not only supply milk to babies but will give it free of cost to soldiers and sailors. Of sixty-three babies examined on one day recently at the New York Diet Kitchen Association, more than 50 per cent. were suffering from malnutrition. To remedy the conditions found at the various examination centers, a canvass for the purpose of bringing babies under supervision has been planned. A census of New York's 600,000 children of less than 5 years of age is to be made. It has been found that one visitor reaches about fifty children a day and a physician can examine about thirty babies a day.

New War Hospitals.—The War Department has taken the ten-story building at the northwest corner of Lexington Avenue and Twenty-Second Street, which has just been completed by the city for the Manhattan Trade School for Girls, for use as a war hospital.——The New York Homeopathic Medical College and Flower Hospital has completed plans to convert a six-story factory building on East Sixty-Third Street into a hospital for wounded soldiers. This property adjoins the Flower Hospital. It is estimated that the changes in the building and the equipment will cost about $100,000.——Ground has been broken at 18 West One Hundred and Thirty-Third Street for a hospital to be known as the McDonough Hospital. The building is to cost about $100,000. It will be a regulation base hospital and will accommodate 200 patients. It is to be used exclusively for negro patients. White physicians will head the departments temporarily until negro physicians are trained to take over the work. Dr. Charles N. Dowd will head the surgical department. Dr. Howard C. Taylor and Dr. William P. Healy will also be on the staff temporarily.

New York City

Instruction in Health Work for Young Children.—In cooperation with the Peoples' Institute, Federation for Child Study, and the Bellevue Social Service, a course in war-time training for volunteers in health work for children of school age is now being conducted by Teachers College, Columbia University, under the auspices of the nutritional committee.

Personal.—Dr. C. H. Stockwell, surgeon of the *Carolina*, which was torpedoed, June 4, is among the rescued.——Dr. Herbert C. Allen, chief of staff, Dr. J. Hubley Schall, chief surgeon, and Dr. E. Rodney Fiske, of the Cumberland Street Hospital, Brooklyn, have handed their resignations to Charity Commissioner Bird S. Coler.——Dr. Henry Keller sailed for the Orient, June 11, with the medical unit that is being sent to Palestine.

New York Clinic for Speech Defects.—This is the first free medical clinic to be licensed by the state board of charities devoted solely to the cure of defective speech conditions. Though open only a few monthts, it has already treated more than 300 cases. It was organized to treat all forms of speech and voice disorders; to take care of teeth, mouth, and jaw conditions when such conditions are the causative factors of defective speech; to reeducate patients to overcome faulty voice or speech habits; to reeducate those who are deaf or hard of hearing. The clinic also maintains a bureau of information and a clearing house for speech and voice defects.

OHIO

Typhoid Statistics.—It is estimated by the state department of health that if the prevalence of typhoid fever in 1918 is as great as in 1917, 1,400 Ohio men of military age and at the most productive period of life will lose four weeks of working time. The department urges local health officials to support it in a vigorous campaign against typhoid.

More Tuberculosis Beds Needed.—The state department of health estimates that Ohio should raise its capacity of 1,500 tuberculosis beds to 5,000 in order to care adequately for the sufferers from tuberculosis in the state and to protect the remainder of the population from infection. The department is endeavoring to enlarge the state sanatorium at Mt. Vernon, and is urging the formation of health districts in counties which have not as yet organized.

Personal.—Dr. Austin S. McKitrick, Kenton, has been elected a trustee of the Ohio Northern University, Ada.——Dr. Charles L. Brown, Cincinnati, has been appointed city dairy and food inspector.——Dr. Joseph W. Hall, Cincinnati, has succeeeded Dr. Philip Dorger as city physician. Dr. Dorger has been city bacteriologist.——Dr. Harry M. Box has been appointed chief police and fire surgeon of Cincinnati, succeeding Dr. J. Stewart Hagen, who resigned to enter military service.——Dr. John M. Withrow has resigned as a member of the staff of the Cincinnati General Hospital, after eighteen years of continuous service.——Dr. Mark A. Brown has been appointed clinical professor of medicine in the University of Cincinnati.

PENNSYLVANIA

Personal.—Dr. John T. Dougherty, Hudson, suffered a fracture of the leg when his automobile went over an embankment, May 21.

Women Graduated.—A class of eight was graduated by the Women's Medical College of Pennsylvania, Philadelphia, June 5. The principal address was delivered by the Rev. Anna Howard Shaw of New York City.

Solarium Transferred.—The exercises attending the transfer of the new solarium for tubercular children of Ashland and vicinity to the state, were held June 5, at Ashland. The solarium is the gift of Mrs. Caroline Lind of Brooklyn. Dr. Jonathan C. Biddle, superintendent and chief surgeon of the Fountain Springs State Hospital, was in charge of the exercises.

Thirty Dispensaries to Be Opened.—Arrangements have been made by the state health department for the opening of a genito-urinary dispensary at Harrisburg. The dispensary will be in the rooms of the tuberculosis dispensary conducted by the state. This dispensary is one of thirty to be opened in various parts of the commonwealth by the health authorities. They are organized for a three-fold purpose: the relief of the physician from the almost compulsory burden of caring for the numerous charity patients suffering from venereal diseases; the prompt and efficient care of such patients free of charge who otherwise would neglect their condition with serious results, and, the betterment of the general health of the community by diminishing and, if possible, eliminating the menace of transmission of the seriously infectious venereal diseases by reaching all such cases and rendering them innocuous as rapidly as possible. The dispensaries were planned by the late Dr. Samuel G. Dixon, months before his death.

Philadelphia

Portrait Presented to Academy.—Through the generosity of Edward H. Coates, for many years president of the Pennsylvania Academy of Fine Arts, the permanent art collection has been enriched by a portrait of the late Dr. S. Weir Mitchell, who for many years was president of the academy.

Infant Mortality High.—The Child Federation has been investigating the problem of its child mortality, which is now higher than in any other city of the United States with one exception. The investigations show that in the poorer sections, the salaries of a year ago are being stretched over the greater demands of today with the result of crowded housing conditions, poor and insufficient food, and inadequate sanitation.

College of Physicians Meets.—At the stated meeting of the College of Physicians of Philadelphia, June 5, papers were read by Lieut.-Col. Pearce Bailey, M. C., N. A., on "Neuropsychiatry in the Army"; by Major Robert M. Yerkes, San. C., N. A., on "Psychological Examinations in the Army"; by Major Charles Bagley, Jr., M. R. C., U. S. Army, on "Neuro-surgical Lessons of the War." The discussion on these papers was opened by Major Stewart Paton, M. R. C., U. S. Army.

Personal.—Dr. Elmer H. Funk has been appointed medical director of Jefferson Medical Hospital to succeed Dr. Henry K. Mohler, who recently resigned to join the Jefferson Base Hospital Unit No. 38. To assume this position, Dr. Funk has resigned as a member of the tuberculosis examining board at Camp Dix.——Dr. Malcolm MacFarlan was knocked down by an automobile, June 14, while crossing Market Street and was taken to the Hahnemann Hospital, where he was found to be suffering from slight internal injuries.

TEXAS

Medical Colleges Merge.—The Fort Worth School of Medicine, medical department of the Texas Christian University, is reported to have merged with the Baylor University College of Medicine at Dallas.

VIRGINIA

New Officers.—At the annual meeting of the Norfolk Medical Society, June 3, Health Commissioner Powhatan S. Schenck was elected president, Dr. Southgate Leigh, vice president, and Dr. Dandridge P. West, Norfolk, secretary-treasurer.

Hospital Notes.—The state orthopedic hospital, which has been offered by the Medical College of Virginia to the state board of health, has been accepted by the board and will be conducted at the Medical College of Virginia and operated in connection with the Memorial Hospital until suitable buildings can be erected.

Personal.—Drs. Lawrence Ingram and Thomas L. Driscoll have been appointed members of the staff of district physicians of Richmond by the administrative board.——Dr. B. L. Phillips, Richmond, has reconsidered his resignation and consented to continue to serve as a member of the staff of the district physicians until the end of his present term.——Dr. Richard W. Garnett, health officer of Fauquier County, has accepted a position with the state board of health and will have charge of medical inspection and of the control of contagious diseases.——Dr. William T. Graham, Richmond, has been appointed head of the state orthopedic hospital.

New State Board of Examiners.—The following members of the state board of medical examiners have been commissioned for a term of four years: first district, Dr. John H. Ayers, Accomac; second district, Dr. P. St. Louis Moncure, Norfolk; third district, Dr. Junius E. Warinner, Richmond; fourth district, Dr. J. Bolling Jones, Petersburg; fifth district, Dr. Richard S. Martin, Stuart; sixth district, Dr. John W. Preston, Roanoke; seventh district, Dr. Philip W. Boyd, Winchester; eighth district, Dr. Samuel W. Maphis, Warrenton; ninth district, Dr. William W. Chaffin, Pulaski; tenth district, Dr. Robert Glasgow, Lexington. Dr. J. Leonard Jennings, Danville, was named as homeopathic member of the board and Dr. E. H. Shackleford, Richmond, as osteopathic member.

CANADA

Miscellaneous.—The government of Saskatchewan is to make a medical inspection of all defective children in that province.——Western University, London, Ont., has fallen into line in admitting women students to the study of medicine in that institution.

Personal.—Col. Alexander Primrose, Toronto, has been made a Companion of the Bath.——Col. George E. Armstrong, Montreal, has been made a Companion of the Order of St. Michael and St. George.——Dr. George Badgerow, formerly of Toronto, but for several years a practitioner in London, England, has been made a C. M. G.

Research at Toronto and McGill Universities.—A donation of $2,000,000 has been promised to the University of Toronto for research work, and the governors are considering the acceptance of the gift. Prof. A. B. Macallum, chairman of the scientific and industrial research council of Canada, recently gave it as his opinion that research science faculties should at once be established at McGill and Toronto universities.

GENERAL

Bequests and Donations.—The following bequests and donations have recently been announced:

To the Medico-Chirurgical Faculty of Maryland, his medical library, by the will of Dr. Henry M. Wilson, Baltimore.

American Theatrical and Hospital Association, $6,000, by the annual benefit at the Auditorium Theater, Chicago, June 9.

Goshen (Ind.) Hospital, $5,000, by the will of Hannah B. Walker.

Ossining Hospital, Ossining, N. Y., $1,000, by the will of Mrs. Julia Geer Simmons.

Catholic Hospital Association Meeting.—The third annual convention of the Catholic Hospital Association was held, June 18, 19 and 20, at St. Francis Xavier's Academy, Chicago. The program included several addresses bearing on the standardization of hospitals. The Rev. Charles B. Moulinier, S.J., regent of the Marquette University School of Medicine, Milwaukee, is president of the association.

National Tuberculosis Association Meeting.—The fourteenth annual meeting of the National Tuberculosis Association was held in Boston from June 6 to 8, under the presidency of Dr. Charles L. Minor, Asheville, N. C. The following officers were elected: President, Dr. David R. Lyman, Wallingford, Conn.; honorary vice president, Col. George E. Bushnell, M. C., U. S. Army; vice presidents, Drs. Lawrason Brown, Saranac Lake, N. Y., and Lee K. Frankel, New York City; secretary, Dr. Henry Barton Jacobs, Baltimore; treasurer, Dr. William H. Baldwin, Washington, D. C.; executive committee, William T. Parsons, Washington, D. C., and Drs. Orville W. McMichael, Chicago; Charles L. Minor, Asheville, N. C.; Hoyt E. Dearholt, Milwaukee; Fred A. Hoffman, Newark, N. J., and Edwin R. Baldwin, Saranac Lake, N. Y.; directors, Mrs. F. C. Hodgston, Atlanta, Ga.; George F. Canfield, New York City; Col. Frank Billings, M. C., N. A., Chicago; Dr. Alfred Henry, Indianapolis; Bolton Smith, Memphis, Tenn.; Col. George E. Bushnell, M. C., U. S. Army, Washington, D. C.; Miss Agnes Randolph, Richmond, Va.; Dr. Alfred Meyer, New York City; W. Frank Persons, Col. A. M. Foster, New Haven, Conn.; Isaac Adler, Rochester, N. Y.; Thomas McCrae and Dr. W. Jarvis Barlow, Los Angeles, Calif. The association adopted resolutions deploring the retirement of Surgeon-General Gorgas, and requested that he be continued in active service in his present position, so that neither his work nor his plans may be interrupted.

Training School for Mental Hygiene Workers.—It is announced from the New York headquarters of the National Committee for Mental Hygiene that a war emergency course will be given at Smith College, Northampton, Mass., to prepare workers to assist in reclaiming soldiers suffering from nervous and mental diseases. There is a large number of these maladies in the present war, as has been found in the experience of foreign countries as well as in our own Army. In the treatment of these soldiers, civilian aides as well as medical specialists are required, and it is for the training of these aides that the course is provided. It will be given also at the Boston Psychopathic Hospital through a subcommittee consisting of Drs. E. E. Southard, Boston; William L. Russell, L. Pierce Clark of New York, Walter E. Fernald Waverly, Mass., and William A. Neilson, Ph.D., president of Smith College. The work is to be under the immediate direction of Miss Mary C. Jarrett, chief of social service at the Boston Psychopathic Hospital. The course will continue for more than eight months and will be open to college graduates and other young women who have had an equivalent of technical training. The academic portion of the instruction will be given at Smith College from July 8 to August 31, to be followed by six months' practice work at various centers where there are opportunities for social work with psychiatric cases under the direction of trained social workers. Many eminent psychiatrists, psychologists and sociologists will be among the lecturers in the course.

FOREIGN

Medical Society Organized at Athens.—We are informed from Greece that a medico-surgical society has been organized at Athens, the purpose of which in part is to inform the profession in other countries of what is being done in the medical sciences in Greece. It seems to be the plan to send out carbon copies of the typewritten transactions, in French, to a few leading medical journals in other lands. Dr. N. Alivisato is president and Dr. A. Portocalis, Rue Canaris 11, Athens, is secretary.

National Information Bureau in France.—The French authorities have organized a special service for the purpose of disseminating information on various questions, particularly connected with the war, and it has distributed millions of educational pamphlets and circulars in the last year or two. The headquarters are at rue François Ier 3, Paris, which is also the headquarters of the Union contre la Propagande ennemie. The National Paper Commission has also been organized, which has lightened the burdens of the periodical press, and the National Press Commission is also simplifying matters. The medical press is not represented in this Office national de la Presse, and the Association de la Presse médicale has recently petitioned the government to permit it to be represented in the commission, citing various reasons why this should be done.

SOUTH AND CENTRAL AMERICA, MEXICO AND WEST INDIES

Argentine Medical Association Organizes an Honor Court.—The *Semana Medica* states that at the recent annual meeting of the Asociacion Medica Argentina at Buenos Aires, a *tribunal de honor* was organized, and Drs. J. Mendez, A. M. Centeno, E. Zarate, D. J. Cranwell and I. Allende were appointed as the executive board.

Twenty-Fifth Anniversary of the Gaceta Medica de Caracas.—As this journal is the official organ of the National Academy of Medicine of Venezuela, the twenty-fifth anniversary of its establishment was celebrated by a special historical meeting of the academy, although the academy itself was not organized until 1904. The evolution of medicine in Venezuela was reviewed by the first president of the local medical society, Dr. F. A. Risquez, and the history of the *Gaceta* was told by Dr. L. Razetti, the only director of the *Gaceta* since its foundation, who is also permanent secretary of the academy.

The Alcohol Question in Chile.—The *Semana Medica* reproduces a letter recently received from the secretary of the Liga Nacional contra el Alcoholismo of Santiago, Chile, Dr. C. F. Peña. He relates that last December an official committee was appointed by the authorities to study ways and means to reduce the consumption of alcohol. One of the first steps was to publish a series of articles which the lay press is publishing, not only to educate the public regarding the evils of acohol, but also to convince the liquor manufacturers that it would be to their own pecuniary interest to restrict materially their output of spirituous beverages. The higher prices they would receive from restricted output would more than counterbalance the loss in quantity. The lay press has taken up the matter with energy, supplementing the league's articles with editorials. Peña urges the anti-alcohol forces in Argentina to have his league's articles or their equivalent reproduced in the Argentine lay press, as he thinks that this measure of restricted production and higher prices solves the problem of alcohol by harmonizing private interests with public health interests. He adds that concerted action in neighboring countries would strengthen the movement materially.

BUENOS AIRES LETTER

Buenos Aires, May 6, 1918.

Medical School at La Plata

The executive board of the University of La Plata, on the initiative of the rector of the university, Dr. R. Rivarola, has voted to organize a preparatory school for the medical sciences, corresponding to the first three years of the medical curriculum at the University of Buenos Aires. The principal reason for the foundation of this medical school is the overwhelming number of students of these first years at Buenos Aires. There are more than 3,000 students enrolled at Buenos Aires in the medical and dental departments and in the departments for pharmacy and obstetrics. The cities of Buenos Aires and La Plata are only 60 kilometers (37 miles) apart. The new school will start the first two year courses in 1919, and the third year will be added in 1920.

Strike of Students at Cordoba

There has long been a movement under way for the reform of the statutes of the University of Cordoba, in northern Argentina, but any change has been opposed by the executive board of the university. The officers of the various faculties form the board, and their positions are for life. This system of administration was modified some time ago in the other state university, the one at Buenos Aires. On account of some of the measures imposed by the board of the University of Cordoba, there has recently been a strike on the part of the students, which compelled the intervention of the national authorities. Dr. Matienzo was appointed arbitrator, and he has made his report to the government, and the decision of the latter is now awaited. All the medical schools of Argentina (Buenos Aires and Cordoba) are state institutions. No schools of the kind can exist except those belonging to the state, according to the laws of the country.

Campaign Against Malaria

The president of the Public Health Service has gone to the northern part of the country to reorganize the antimalaria service for more effectual work. On account of the enormous size of the area affected and the scanty population, as well as the funds available, it will be necessary to limit to certain selected points the measures to be applied.

Official Organ of the Academy of Medicine

When the Academia de Medicina of Buenos Aires was founded in 1822, a bulletin was issued the following year, entitled the *Anales de la Academia de Medicina*, but it was not long lived. The bulletin has been now revived, and the first number of the first volume has appeared. The leading article is Ayerza's report on endemic regional arsenic poisoning [from the drinking water. The region affected is the Bell Ville district. This endemic chronic poisoning was described in The Journal, Feb. 16, 1918, p. 496.]

Alcoholism and Mental Disease

The official report of the state insane asylum, covering a period of twenty-seven years to date, reveals that among the 28,035 patients during that period alcohol was responsible for the insanity in 39.6 per cent.

New Chief of Public Health Service

The national executive has appointed Prof. Dr. G. Araoz Alfaro president of the Departamento Nacional de Higiene. Dr. Alfaro has ratified the appointments of all the personnel of the service, and intends to reorganize the department. Among his chief efforts figures the organization of an active campaign against pulmonary tuberculosis, with permanent institutions to aid in combating it. New hospitals, sanatoriums and dispensaries are to be created. The government plans a tax on the Lottery which it is expected will bring in about four millions annually.

Death of Dr. B. Sommer

Dr. B. Sommer died April 11, two years after he had completed twenty-five years' service as professor of dermatology in the medical school of the University of Buenos Aires. He was the founder of this chair in 1892.

Elections in the Medical Societies

The annual elections have recently been held in the principal medical societies of Buenos Aires. In the Asociacion Medica Argentina Dr. C. Robertson was elected president, Dr. J. Saralegui secretary, and Dr. P. Hardoy, director of the

Revista, published by the association. In the Sociedad de Cirugia, Dr. M. Castro was elected president and Dr. M. Antelo, director of the *Revista*. In the Sociedad de Higiene, Microbiologia y Patologia, Dr. J. E. Penna was appointed president.

LONDON LETTER

LONDON, May 22, 1918.

Interallied Conference on Disabled Fighting Men

The Duke of Connaught has opened the Interallied Conference on Disabled Fighting Men in the Central Hall, Westminster. The object is to discuss the after-care of discharged sailors and soldiers. Nearly 100 British representatives attended. The other countries represented were Australia, Belgium, Canada, France, India, Italy, New Zealand, Portugal, Serbia, South Africa and the United States. Speaking in French, the duke welcomed those present on behalf of the king and the government of Great Britain. "It is just a year ago," he said, "that the first Allied Conference, called by the French and Belgium governments, met in Paris and laid the foundation of these meetings, resulting in the formation of a permanent committee with a research bureau and museum in Paris. The first number of the *Inter-Allied Review on the After-Care of Disabled Men* has just appeared, and in its pages will be found from time to time all the latest developments of science in the great cause which we all have so much at heart, namely, the healing of wounds and the reestablishing in civil life of men maimed and disabled by war. As our armies are united in the field against the common foe to uphold liberty and justice against invasion and oppression, so are we all united here today to bring to light and to discuss all that is new and all that is scientifically possible to alleviate the sufferings and heal the wounds of the brave and gallant men who side by side have fought and shed their blood for home and country in this great war. I am happy and proud to welcome here today delegates from all our great Allies and neighbors, whose armies are now fighting shoulder to shoulder with our men in the terrible struggle only some hundred miles away—delegates from France (among whom I am pleased again to see Dr. Bourrillon, president of the Permanent Committee in Paris), Italy, Belgium, United States, Portugal, Serbia, and Siam, and from our gallant Dominions of Canada, Australia, South Africa, New Zealand, India, Newfoundland, and other parts of the British Empire." In connection with the conference there is an exhibition of the various kinds of apparatus used by the disabled and at which they perform such operations as basket making and boot repairing. This was visited by the king and queen, who took great interest in the work and chatted with representatives of foreign countries, frequently in their own language.

The Medical Service of the Navy

In this war the navy has been called the silent service, not because of any want of recognition of the fact that its work is all-important, but because the circumstances have rendered it necessary that secrecy should be maintained as to most of its operations. Hence while much has been heard of the work of the Army Medical Service, little is heard of the Naval Medical Service. Yet it could furnish a wonderful record of preparation and foresight and work performed without a hitch on the two most important occasions when it was put to the test—the battles of Jutland and Zeebrugge. Several new formations have been created under war experience, such as the Naval Medical Transport Unit, the Naval Massage Corps, and the Naval Voluntary Aid Detachment. In July, 1914, the number of medical officers serving was 520; at the present time the number is 1,378, in addition to surgeon-probationers and dentists. There are fifty-nine dental surgeons holding commissioned rank in the Royal Naval Volunteer Reserve, and serving with the fleet at sea, and 218 surgeon-probationers with the relative rank of sublieutenants. The nursing sisters at home and abroad number in all 252. Of the new services, the special unit to deal with the transport of sick and wounded from the fleet is numerically the most important. It consists of thirty medical officers and 500 ratings, with a civilian voluntary personnel consisting of the voluntary aid detachments and bearer parties of approximately 1,200 men, all exempt from military service. There are five regular service ambulance trains, and in addition there is a voluntary aid detachment train always ready for service at Glasgow. There are more than 100 motor ambulances. In Scotland and on the east coast of England are mobile parties which can be sent at short notice from place to place. Nine qualified masseurs or masseuses are attached to each large naval hospital, and recently 104 women members of the voluntary aid detachment have been enrolled for service with the navy and are employed only in hospitals. The great naval hospitals at Haslar, Plymouth and Chatham have accommodations for 3,556 patients, and in the United Kingdom there is accommodation for approximately 10,000 men. In addition there are hospitals at Hong Kong, Bermuda, Simonstown, Malta and Gibraltar, the last two named providing accommodations for 1,450 patients. Since the outbreak of war the health of the navy has been remarkably good, and, in fact, is probably better than in the years preceding the war. There are eleven hospital ships working between the fleet and the shore hospitals. Though the number of naval medical officers killed in action is small in comparison with the Army Medical Corps, a heavy toll has been taken when the comparatively small size of the force is considered. The number of naval medical officers killed or drowned in action to the present date is eighty-three, while nineteen have died in service.

The Epidemic of Acute Encephalitis

The epidemic of acute encephalitis (described in my last two letters) still continues. The various names that have been applied to the condition—acute infective ophthalmoplegia, acute encephalitis myelitis, botulism, etc.—show that considerable doubt prevails as to its nature. Investigations by the local government in collaboration with health officers and physicians continue. The earliest case is reported to have had its onset January 28, and there were two having onset in the week beginning February 10, and two in the last week of that month. In consecutive weeks in March, 7, 3, 10 and 14 cases came to notice; and in April and the first week of May the corresponding numbers were 11, 19, 14, 16 and 6. The largest number of cases has been recorded in London, but groups of cases have occurred also in Sheffield and Birmingham, and single cases have been reported from many other parts of England and Wales. The cases occurred among persons having the most varied occupations. No group of cases was associated with a single occupation. In only one instance were there two cases in the same household. The cases about equally affected the two sexes. The case mortality has approached 20 per cent. It is probable that slight cases have been overlooked. Three cases occurred in infants in the first year of life, one of them being in a breast-fed infant aged 3½ months. Five were in children from 1 to 5, and seven in children from 5 to 10. Of 105 cases of which partial reports are available, sixty-four occurred in persons over 20 years of age. The clinical records at present available relate to eighty-seven cases, but many of them are incomplete, and it is not certain that in all cases there was paralysis of the cranial nerves. The symptoms and signs recorded may be thus summarized: Among general symptoms pyrexia was present in 41 of the 87 cases, usually in the early stage of the illness; it may have been present in some other cases which were not reported on while in that stage. In eight cases it was stated that there was no fever. Of other general symptoms, headache or localized occipital, temporal or frontal pain was recorded in 31 cases. Profuse sweating was noted in 7 cases and an erythematous or other rash in 6. Various mental symptoms come next to pyrexia in order of frequency, namely, drowsiness in 29 cases, lethargy in 18, stupor in 13, asthenia in 12, coma in 9; also vertigo in 17 and delirium in 20. Absence of lethargy was recorded in 3 cases, and the presence of restlessness, irritability or sleeplessness in 5. Of symptoms referable to partial or complete paralysis of certain cranial nerves, there were recorded bilateral facial paralysis in 9, unilateral in 11; bilateral ptosis in 32 cases, unilateral in 2; ophthalmoplegia in 18, diplopia in 18, strabismus in 10, nystagmus in 9, double third nerve palsy in 6, pupillary dilatation with failure of accommodation in 2, and paralysis of the tongue in 2. Affections of speech were noted in 5 cases. Rigidity of the muscles was recorded in 10 cases, muscular tremors in 9, and twitching or jerking of certain muscles of the face or limbs in 6. Among symptoms referable to the gastro-intestinal system, obstinate constipation was recorded in 35 cases, vomiting in 10 cases, difficulty of swallowing in 9, and dryness or soreness of the throat in 3. The parotid glands were swollen in 2 cases. Retention of urine was recorded in 15 cases, and incontinence in 3. The records relating to the circulatory and respiratory systems are not sufficiently complete for useful summary at present. Although in a considerable proportion of the reported cases there was a history of the recent consumption of such foods as sausages, sardines, shrimps, lobsters, canned salmon, cheese, bacon and ham, these and other exceptional foods had not been consumed in the majority of reported cases; and no particular food has been found to be related to the outbreak. The pathologic investigation of the outbreak is being undertaken by the Medical Research Committee. The results so far obtained show no bacteriologic evidence of botulism and give no support to the association of the outbreak with infection from food. Further investigations are in progress. The view has been put forward that the epidemic is the cerebral form of acute anterior poliomyelitis, that is, poliencephalitis; but against this is the fact that there is no prevalence of the ordinary or spinal form of this complaint.

A Permanent Anthropometric Department

At a meeting of the reconstituted National Birth-Rate Commission (instituted by the National Council of Public Morals), a resolution advocating the inclusion in a ministry of health of a permanent anthropometric department was passed. Prof. Arthur Keith stated that the Anthropological Survey Committee, appointed in 1916 by a conjoint board of scientific societies, had reported that a survey was highly desirable in the national interest—the survey of adult males by the Ministry of National Service, of schoolchildren by the Board of Education, and of factory children by factory physicians working under the Home Office. An anthropometric survey is being made of soldiers of the new armies of the United States, and the committee is in communication with the American committee to secure adoption of common methods, so that their results may be comparable. It would be interesting, he said, to compare the original national (Britain) with her descendants in America. A comparison of the skulls and skeletons of ancient with modern British people shows that distinct changes have taken place and apparently are taking place, particularly in the teeth, jaws and faces of modern persons. These changes are of a degenerative nature. There is reason to believe that certain racial constituents of the people suffer from these changes more than others, and the survey should be of such a nature as to elicit the racial constituent of each district and each section of the people in that district.

PARIS LETTER

Paris, May 16, 1918.

The Commission for Radioactive Substances

By decree of the minister of armament and war materials, there has been instituted a committee to be known as the "Comité des corps radioactifs" which will take up particularly the needs of the state and private industries in respect to radioactive substances, and supervise the purchase, manufacture, import and export of such substances. One of the vice presidents of this committee is a representative of the army medical service; the civil practitioners and the radium institute are also represented. This decree is based on reports showing the increasing use of radioactive substances in war and private industries, and in military and civil hospitals. The radium industry, a product of France, should have a much greater growth and development after the war.

Gift from the American Red Cross

The American Red Cross has donated to the French Red Cross 10,000,000 francs in recognition of the valuable services rendered by the latter and to cement the friendship already existing between these two bodies. The American Red Cross has admitted to its honorary membership the Société de secours aux blessés militaires, l'Union des Femmes de France and l'Association des Dames françaises.

Epidemic Lethargic Encephalitis

March 22, Prof. Arnold Netter called the attention of the Société medicale des hôpitaux de Paris to the existence of a small epidemic of lethargic encephalitis. This affection, usually febrile in nature, makes its onset with headache and sometimes vomiting. Soon there appears somnolence, increasing in degree gradually, and nearly always an involvement of the muscles of the eyes. Lumbar puncture is negative, bacteriologically and otherwise. Since then other physicians in Paris have seen similar cases, and they have also appeared in England in London, Sheffield and Manchester (epidemic in ·por). The characteristic symptoms in connection with repr eye include ptosis of the eyelid, strabismus, immobility meas eyeball and nystagmus. The internal eye muscles are the pr volved so often, although there may be paralysis of public l dation, a slowness of the iris to react to light. The neighbori nnervated by the facial nerve, those of the tongue, materially nx and of the extremities, may participate in the paralysis. Tremor is not exceptional. The typical symptoms of meningitis, Kernig's sign, stiffness of the muscles and irregular pulse, are absent or present only in mild degree. The disease is grave. Death or a cure may take place in a few days. Usually the disease is prolonged for weeks or months. During the convalescence the persistence of muscle fatigue and eye disturbances is noted for a long time. Netter is of the opinion that this disease is similar to that mysterious epidemic which was observed in Italy in 1890 and known as "nona" and whch was characterized by a lethargy which often proved fatal.

Signs of Death

The usual procedure employed at the front to determine that death has actually occurred is to inject fluorescein according to the method of Dr. S. Icard of Marseille. In the living the eye will take on a peculiar green color, as though a large emerald had been set in the orbit. If there is no such coloration to be noted one or two hours after this injection, it may be stated positively that the person is dead. Another positive sign is the acid reaction of the spleen tissue (Ambard and Brissemorel). Dr. Terson of Paris has called attention to eye signs indicative of death which are obtained by acting on the external circulation of the eye. Hàlluin recommended the instillation of ether, which produces rubefaction in the living eye; but this is sometimes very dangerous for the cornea. It is better to produce a reaction by mechanical means, by scarification, cauterizing the conjunctiva of the eyeball or of the eyelids, chemically by means of copper sulphate or by conjunctival injections of sodium chlorid solution. These procedures are not dangerous; if redness is not produced thereby it signifies that there is no circulation. Terson has experimented with the use of ethyl-morphin hydrochlorid powder (dionin), which produces intense vasodilatation in the living, with chemosis, and yet without any danger to the eye. He is of the opinion that if the result of these various methods is negative, two hours after the supposed death, there is no danger of premature burial.

Sanitation of Dugouts

The Société de médecine publique et de génie sanitaire recently discussed this subject at some length. The results of this discussion may be summarized as follows: The making of airholes in these dugouts or shelters has never caused any special inconvenience, hence openings should be made in the masonry recently built to prevent the entrance of asphyxiating gases. These openings should, however, allow air to enter so that the shelters will be ventilated sufficiently. The number of men to be admitted to these shelters and the cubic feet of air space which they should have should be computed at not less than 4 cubic meters of air space for each person. After each alarm these dugouts must be ventilated as much as possible by opening wide the entrances. They should be cleaned and disinfected at regular intervals; all shelters should be taken care of in this way; milk of lime (suspension of calcium hydroxid) seems to be the best available agent for this purpose. All persons suffering with infectious diseases should be isolated as much as possible from the other individuals who have sought refuge in the same shelter. The society called the attention of the authorities to the most efficacious means of avoiding the accidents resulting from the ignition of gas freed by a broken conduit or the invasion of the shelters by gas.

For the Blinded Soldiers

Acting on the suggestion of Mr. Georges Kessler, president of the Fonds permanent d'assistance aux aveugles de guerre britanniques, français et belges, Mr. J. Seligman recently placed at the disposal of the blinded soldiers of the allied armies the château de Madrid with 160 rooms, situated near Paris on the confines of the Bois de Boulogne. Mr. Seligman has set apart for this service an annual income of 75,000 francs with the sole proviso that American soldiers are to be received and cared for at the château in the same way as the British, French and Belgian soldiers. The château is given for this purpose for a term of three years.

The Legion of Honor

Dr. Alexis Carrel of New York has been made a commander of the Légion d'honneur, and Dr. G. Lafayette Foster, director of the Canadian Army Medical Service an officer.

Personal

May 21, the Académie de médecine elected Dr. Siredey of Paris to membership in the section on pathologic anatomy.

Dr. Vaillard, medical inspector general (retired) has been made a member of the Conseil supérieur d'hygiène publique de France, vice Dr. Mosny, deceased.

Deaths

John Harper Long, professor of chemistry at the Northwestern University Medical School and member of the Council on Pharmacy and Chemistry, died at his home in Evanston, Ill., June 14, after an illness of over six months. Professor Long was born near Steubenville, Ohio, in December, 1856. He was graduated from the University of Kansas in 1877, and later studied at Tübingen, Germany, receiving the degree of doctor of science in 1879. He was appointed professor of chemistry in the medical school of Northwestern University in 1881. Professor Long was a member of the referee board of consulting scientific experts of the United States Department of Agriculture.

He was a chemist of the state board of health and of the sanitary district of Chicago. He served as president of the American Chemical Society in 1903, of the American Association for the Advancement of Science in 1903 and of the Institute of Medicine of Chicago in 1917. Professor Long was a member of the United States Pharmacopoeia Revision Committee, and from the time of its organization until his death a member of the Council on Pharmacy and Chemistry. During 1913-17 he was dean of the school of pharmacy of Northwestern University.

Professor Long did much chemical research work, particularly in the branches of physiologic chemistry closely related to medicine. As a member of the Council on Pharmacy and Chemistry he not only gave much time to the routine work, but in addition carried out many original investigations.

Professor Long leaves, besides his widow, Catherine S. Long, four sons—Albert, Esmond, Lother, Captain, United States Marine Corps in France, and Byron, Lieutenant, United States Army—and one daughter, Ariel, wife of Lieut. E. P. Miller of Washington, D. C.

PROF. JOHN H. LONG,
Member of the Council on Pharmacy and Chemistry

Arthur Washington De Roaldes, New Orleans; Tulane University, New Orleans, 1870; aged 69; formerly a Fellow of the American Medical Association; fellow of the American Laryngological Association and president in 1916-1917; a member of the American Otological Society; emeritus professor of diseases of the eye, ear, nose and throat in the New Orleans Polyclinic; assistant surgeon of the Sixth International Ambulance Corps during the Franco-German War; founder, trustee and surgeon-in-chief of the Eye, Ear, Nose and Throat Hospital, New Orleans; commander of the Legion of Honor in France; commander of the Order of St. Gregory the Great and knight of the Order of Saints Maurice and Lazare; died at his home in New Orleans, June 13.

Seth Delmar Dice, Hollywood, Calif.; New York University, New York City, 1897; Cornell University, New York City, 1899; aged 46; formerly a Fellow of the American Medical Association; who contracted tuberculosis while an intern in Bellevue Hospital, and after an arrest of the infection was again attacked in 1906, and had been ill since that time with pneumothorax, pneumonia, and empyema, for which four ribs were resected in 1915; died in Los Angeles, May 22, from amyloid degeneration of the liver and kidney.

George Winfield Foster, Stevenson, Ala; Vanderbilt University, Nashville, Tenn., 1892; aged 61; a Fellow of the American Medical Association; and Association of Surgeons of Southern Railways, and president of the Jackson County Medical Society; local surgeon for the Nashville, Chattanooga and St. Louis, and Southern railroads; died at his home, March 11, from meningitis following mastoiditis.

Benjamin E. Miller, Albion, Ind.; Cincinnati College of Medicine and Surgery, 1871; aged 72; formerly a Fellow of the American Medical Association; a member of the Indiana State Medical Association; and treasurer of the Noble County Medical Society; a veteran of the Civil War; for twenty-two years a pharmacist, and for many years health officer of Albion and Noble County; died at his home, May 31, from valvular heart disease.

U. Sim Grant Deaton, Toledo, Ohio; Memphis Hospital Medical College, Memphis, Tenn., 1894; aged 50; a member of the Ohio State Medical Association; a member of the House of Representatives and state senator from Lucas County; captain and assistant surgeon in the Spanish-American War, with service in Cuba, China, and the Philippine Islands; died in Robinwood Hospital, Toledo, May 31, from appendicitis.

John Hillman Bennett, Pawtucket, R. I.; Boston University, 1891; aged 48; a member of the Rhode Island Medical Society, and for several terms president; for many years a member of the State Board of Health, and at the time of his death president; and health officer of Pawtucket; died at his home, June 4, from aneurysm of the aorta.

William Seth Watson, Sacramento, Calif.; Bellevue Hospital Medical College, 1870; aged 67; formerly a Fellow of the American Medical Association and American Electro-Therapeutic Association; medical director of the Institute for Nervous and Mental Disease, Fishkill-on-Hudson, N. Y., and mayor of Fishkill; for nine years a resident of California; died at his home, May 26.

Lieut. Thomas Hart Raines, M. R. C., U. S. Army, Savannah, Ga.; Medical College of Georgia, Augusta, 1900; aged 39; formerly psychiatrist in the Westchester County Penitentiary, East View, N. Y.; and local medical examiner for the Atlantic Coast Line District; on duty as psychiatrist at the Base Hospital, Fort Riley, Kan.; died at that institution, May 24.

Robert R. Hopkins, Richmond, Ind.; Cincinnati College of Medicine and Surgery, 1868; aged 73; a member of the Indiana State Medical Association; surgeon of United States Volunteers during the Civil War; for two years superintendent of an asylum near Cincinnati; an expert on medical jurisprudence; died at his home, May 30.

Robert Day William, Trafalgar, Ind.; Miami Medical College, Cincinnati, 1868; Bellevue Hospital Medical College, 1879; aged 75; a member of the Indiana State Medical Association and once president of the Johnson County Medical Society; a veteran of the Civil War; died at his home, June 3.

Lieut. Tony Edward Hunter, M. R. C., U. S. Army, Versailles, Ind.; Kentucky University School of Medicine, 1904; aged 39; formerly a Fellow of the American Medical Association; a member of the Indiana State Medical Association; died in Hattiesburg, Miss., April 18, from pneumonia.

William Bacon McGill, Lancaster, Calif.; University of Pennsylvania, Philadelphia, 1889; aged 59; a member of the Medical Society of the State of Pennsylvania; district surgeon for the Southern Pacific System; died at his home, March 19, from septicemia following erysipelas.

Albert Jeremiah Elliott, San Diego, Calif.; University of Michigan Homeopathic Medical School, Ann Arbor, 1897; aged 45; formerly a Fellow of the American Medical Association; died in St. Joseph's Hospital, San Diego, May 23, a day after a surgical operation.

Henry B. McKenzie, Enid, Okla.; Medical Department of the University of Tennessee, Nashville, 1887; aged 65; a member of the Oklahoma State Medical Association, and president of the Garfield County Medical Society; formerly health officer of Enid; died at his home, April 23, from pneumonia.

Gaines Worley, St. Augustine, Fla.; Chattanooga (Tenn.) Medical College, 1900; aged 42; a Fellow of the American Medical Association; surgeon of the Florida East Coast Railroad Hospital, St. Augustine; died in Johns Hopkins Hospital, Baltimore, May 30.

William Lockwood Parker, Baker, Ore.; University of Oregon, Portland, 1896; aged 48; formerly a Fellow of the American Medical Association; a member of the Oregon State Medical Association; died in the Good Samaritan Hospital, Portland, May 31.

Gabriel F. Foster, Memphis, Mo.; Long Island College Hospital, Brooklyn, 1868; aged 80; formerly a Fellow of the American Medical Association; a member of the Missouri State Medical Association; died at his home, April 18, from cerebral hemorrhage.

Ethelbert Eldridge Meek, Regina, Sask.; Manitoba Medical College, Winnipeg, 1901; aged 40; medical officer of the sixty-eighth battalion and for two years on duty in France; died from wounds, in a Canadian Hospital at Boulogne, France, June 2.

Jaroslav Radda, New York City; University of Maryland, Baltimore, 1908; Fordham University, New York City, 1909; aged 45; a Fellow of the American Medical Association and American Urological Association; died at his home, June 5.

James Henry Tobin, Pittsfield, Mass.; Albany (N. Y.) Medical College, 1890; aged 50; formerly a Fellow of the American Medical Association; a member of the Medical Society of the State of New York; died at his home, June 6.

William Thomas Bruce, Lebanon, Pa.; Hahnemann Medical College, Philadelphia, 1876; aged 72; for several terms a member of the City Council, local board of health and board of education; died at his home, June 1, from uremia.

Joseph Hervy Buchanan, North Plainfield, N. J.; Jefferson Medical College, 1896; aged 46; a Fellow of the American Medical Association; clinical assistant in the Muhlenburg Hospital, Plainfield; died at his home, June 7.

Lieut. Charles Richard Long, M. R. C., U. S. Army, Sedalia, Mo.; National University of Arts and Sciences, St. Louis, 1916; a member of the Missouri State Medical Association; was killed in battle in France, early in April.

Samuel A. S. Jessop, Kittanning, Pa.; Jefferson Medical College, 1879; aged 61; a member of the Medical Society of the State of Pennsylvania; died at the home of his brother in Kittanning, June 2.

Joseph Henry Mattingly, Johnstown, Ohio; Medical College of Ohio, Cincinnati, 1885; aged 58; formerly a member of the Ohio State Medical Association; died at his home, June 4, from arteriosclerosis.

James Cook Benson, Camden, Ala.; University of Alabama, Mobile, 1887; aged 50; a member of the Medical Association of the State of Alabama; died at the Burwell Infirmary, Selma, June 1.

William J. Robinson, Lapeer, Mich.; Michigan College of Medicine, Detroit, 1881; aged 64; a Fellow of the American Medical Association; died at his home, May 31, from septicemia.

Paul D. Carpenter, Pittsford, N. Y.; Jefferson Medical College, 1867; aged 52; a Fellow of the American Medical Association; died at his home, June 4, from peritonitis.

John Henry Hinchman, Richmond, Va.; Medical College of Virginia, Richmond, 1879; formerly a member of the Medical Society of Virginia; died at his home, about May 31.

Don Leroy Talcott, Crofton, Neb.; State University of Iowa, Iowa City, 1904; a member of the Nebraska State Medical Association; died at his home, May 26.

William S. Purkhiser, Moscow, Ohio; Eclectic Medical Institute, Cincinnati, 1898; aged 53; for several terms coroner of Clermont County; died at his home, June 4.

Watson F. Quinby, Wilmington, Del.; Jefferson Medical College, 1847; aged 93; one of the original experimenters with aircraft; died at his home, May 26.

Aurelia Springer, Lewiston, Maine; New England Female Medical College, Boston, 1872; aged 82; died in the Maine General Hospital, Lewiston, June 3.

Frank Oakley Stockton, East Orange, N. J.; College of Physicians and Surgeons in the City of New York, 1881; aged 58; died at his home, May 27.

Joseph W. Binckley, Canton, Ohio; Cleveland University of Medicine and Surgery, 1867; aged 80; formerly mayor of Canton; died at his home, June 1.

Warren Lee Hummer, Greenfield, Iowa; University of Nebraska, Omaha, 1904; aged 43; died in a hospital in Omaha, May 28, from nephritis.

James J. Choate, Los Angeles; Washington University, St. Louis, 1879; died about June 1, from heart disease, while making a professional call.

Archibald W. Rhea, Seattle; (license, Washington, 1896); a practitioner since 1860; aged 76; died at the home of his son in Tacoma, May 21.

Orville Juan Perkins, Chicago; Bellevue Hospital Medical College, 1878; aged 68; died at his home, June 14, from valvular heart disease.

Jesse Braman, Wadhams, N. Y.; University of Vermont, Burlington, 1884; aged 64; died at his home, May 28, from cancer of the rectum.

Lewis Robert McFarland, Transfer, Pa.; Eclectic Medical Institute, Cincinnati, 1883; aged 68; died at his home, May 15, from diabetes.

George E. White, Nashville, Tenn.; (license, Tennessee, 1911); aged 41; died at his home, April 23, from traumatic lobar pneumonia.

John K. Stone, Arlington, Texas; Texas Medical College and Hospital, Galveston, 1877; aged 65; died at his home, May 27.

Robert A. McKinney, Lagrange, Texas; University of Pennsylvania, Philadelphia, 1870; aged 73; died at his home, May 30.

Merton Reynolds Streeter, Oshkosh, Wis.; Rush Medical College, 1889; aged 52; died at his home, May 28, from nephritis.

Uriah Irvin Ward, Wichita, Kan.; University of Wooster, Cleveland, 1865; aged 80; died in the Masonic Home, Wichita, May 19.

Alexander Hitchcock, Port Clinton, Ohio; University of Wooster, Cleveland, 1872; aged 70; died at his home, May 27.

Elwood Holaday, West Elkton, Ohio; Pulte Medical College, Cincinnati, 1886; aged 64; died at his home, May 31.

Evan Edmiston Gwynne, Chicago; Hahnemann Medical College, Chicago, 1879; died at his home, about June 5.

Edwin Charles Loomis, Perrysville, Ind.; (License, Indiana, 1898); aged 72; died at his home, May 27.

Leon M. Rosenson, Brooklyn; University of Kharkov, Russia, 1887; aged 54; died at his home, June 3.

Marriages

Capt. Ralph Thomas Knight, M. R. C., U. S. Army, Minneapolis, on duty with the Mobile Surgical Operating Unit, Allentown, Pa., to Miss Phoebe Clara Hill, of Lincoln, Neb., at Mount Vernon, N. Y., June 4.

Lieut. Clayton James Hyslop, Chicago, on duty at Camp Wheeler, Macon, Ga., to Miss Edna Forsythe, Galesburg, Ill., at Macon, Ga., June 8.

Lieut. Robert Jay Cook, M. R. C., U. S. Army, Boston, to Miss Edith M. Valet, at Chickamauga Park, Ga., June 3.

Lieut. Edwin Franklin Syrop, M. R. C., U. S. Army, Baltimore, to Miss Rena Fleischman, recently.

William Wilson Meriwether, Montgomery, Ala., to Miss Mattie D. Hudson, of Macon, Ga., June 19.

Louis Bernard Samaine, Mulliken, Mich., to Miss Dorthia Nichols, of Charlotte, Mich., May 27.

David Wolin, Rochester, N. Y., to Miss Lillian Feinbloom, of Poughkeepsie, N. Y., May 6.

Ralph Leroy Thompson, to Mrs. Elizabeth S. Schuyler, both of St. Louis, May 28.

Charles Wendell Garey, to Miss Margaret Fowler, both of Quincy, Mass., June 1.

Victor Albert Williams, to Miss Mary Bryan, both of Pittsburgh, June 3.

The Propaganda for Reform

IN THIS DEPARTMENT APPEAR REPORTS OF THE COUNCIL ON PHARMACY AND CHEMISTRY AND OF THE ASSOCIATION LABORATORY, TOGETHER WITH OTHER MATTER TENDING TO AID INTELLIGENT PRESCRIBING AND TO OPPOSE MEDICAL FRAUD ON THE PUBLIC AND ON THE PROFESSION

SEVERAL "MIXED" VACCINES NOT ADMITTED TO N. N. R.

Report of the Council on Pharmacy and Chemistry

The "mixed" vaccines which are discussed in the reports that follow were considered by the Council during the past year because inquiries had been received in regard to them.

In publishing these reports it is desirable that the attitude of the Council toward "mixed" vaccines again be stated. In view of the rapid development of bacterial therapy, the possibility for harm that attends the use of bacterial vaccines and the skepticism among experienced clinicians as to the value of vaccines representing a combination of organisms, the Council has felt that it should scrutinize the claims for such agents with exceptional care and that there should be admitted to New and Nonofficial Remedies only those vaccine mixtures for which there is acceptable evidence to indicate that the use of the particular mixtures is rational.

In considering the subject the Council has borne in mind the fact that in many institutions in which cases are studied and the results of therapeutic measures carefully observed and controlled, vaccines of any sort are practically never used—certainly here the stock mixed vaccine has no recognition. Experienced clinicians have generally come to the conclusion that mixed vaccines have no specific action and that any effect they may produce is due to a non-specific protein reaction.

As set forth in the reports, in no case was the evidence submitted by the proprietors sufficient to establish the claims made for the preparations. Hence none was accepted for New and Nonofficial Remedies.

The preparations that form the basis for the accompanying reports are only a few of the many that are being made and sold by some biological houses. Doubtless many of those not dealt with in this report are equally irrational and sold under claims equally—or probably even more—unwarranted than those with which the present report deals.

W. A. PUCKNER, Secretary.

Mixed Vaccines-Abbott

In response to inquiry the Council undertook a consideration of the following "mixed" vaccines sold by the Abbott Laboratories:

M. Catarrhalis-Combined-Bacterin, said to contain killed Micrococcus catarrhalis, Bacillus Friedländer, Pneumococci, Streptococci, Staphylococcus aureus and Staphylococcus albus.

B. Coli-Combined-Bacterin, said to contain killed Streptococcus viridans, Streptococcus hemolyticus and Bacillus coli.

Pertussis-Combined-Bacterin, said to contain killed Bacillus pertussis, Pneumococci, Streptococci, Staphylococcus albus, Staphylococcus aureus and Micrococcus catarrhalis.

Streptococcus-Rheumaticus-Combined-Bacterin, said to contain killed "Streptococci (Rheumaticus, Viridans, etc.)" and Pneumococci.

Streptococcus-Viridans-Combined-Bacterin, said to contain killed Streptococcus viridans, Streptococcus hemolyticus, Pneumococcus and Staphylococcus albus.

The Abbott Laboratories were asked to assist in the investigation of these products and to submit evidence to establish their eligibility for admission to New and Nonofficial Remedies. The manufacturer was informed that the Council accepts "mixed" vaccines or bacterins, provided the usefulness of these products is established by acceptable clinical evidence, and references to the literature bearing on the value of the preparations were requested.

The Abbott Laboratories submitted specimens of the products, the advertising matter therefor and a considerable list of references to current literature; all of which was transmitted to the Committee on Serums and Vaccines for consideration. In due time a referee of the committee submitted the following report:

THE COMMITTEE'S REPORT

The referee has studied the literature covered by the references submitted. In general the articles are favorable to the use of vaccines, though many of these papers do not consider "mixed" vaccines; indeed, a number of the articles do not discuss treatment at all, but are devoted entirely to the consideration of etiology of the disease. Many of the papers are by those who are obviously overenthusiastic on the subject of the use of biologic preparations. One paper—not included in the references submitted by the Abbott Laboratories—records an alarming reaction following a dose of mixed vaccine; no claim is made that improvement followed.

The following comments on the submitted references are offered:

M. Catarrhalis - Combined - Bacterin.—Only four of the nine references given deal with the therapeutic use of the vaccine. The reported results in general were favorable, but sometimes in the discussion evoked by certain of the papers, views the reverse of those expressed by the author were brought forward. The enthusiasm of one writer is shown in his statement that following the use of vaccine in cases of carbuncle complicating diabetes the sugar in the urine disappeared or was reduced. One observer, who reports excellent results in nasal and pharyngeal catarrh, speaks of certain vaccines as "bulk goods," while another considers "——'s No. 7" as the proper thing. It is evident that the reports are not based on careful, scientific data, or such unscientific definition of the product employed would not be used.

B. Coli-Combined-Bacterin.—In the references cited in support of this preparation the following general statements are noted: One enthusiastic writer says, "It must be recognized that we have no satisfactory explanation of the action of vaccines, and their use at present is empirical." One author dwelt on the superiority of autogenous vaccines but admits that occasionally stock vaccines are indicated. One vaccine therapist in concluding an article states, "It is simply impossible to practice modern urology without our modern biologic products." Yet it is a well-known fact that many successful and capable genito-urinary surgeons avoid the use of vaccines, mixed or simple.

Pertussis-Combined-Bacterin.—These reports are uniformly favorable, but are not controlled and their value is not to be compared with a recent report from the New York City Department of Health which indicates that the vaccine is practically valueless. It is noted, further, that one of the articles cited which dealt rather fully with the treatment of pertussis did not mention vaccines.

Streptococcus-Rheumaticus-Combined-Bacterin.—The references cited in support of the preparations by the manufacturer give no support whatever for the use of mixed stock vaccines. The first reference deals with the relation of Streptococcus viridans to arthritis deformans and endocarditis and reports the following cases:

Case 1.—Vaccine case—improvement after eight months.
Case 2.—Slight improvement following use of vaccine.
Case 3.—Slight improvement following use of vaccine.
Case 4.—Marked improvement.
Case 5.—Prompt improvement.
Case 6.—Vaccine not mentioned.
Case 7.—Vaccine followed by slight improvement.

In each of the cases other methods of treatment were used. The paper shows the etiologic relation of Streptococcus viridans rather than the value of vaccines. There is no indication that stock vaccines were used, though the paper is not clear on this point. The second paper deals with the application of vaccine therapy in the treatment of arthritis. This paper is by a man who is avowedly an enthusiast on vaccine therapy. The indications are that he generally used a mixed autogenous vaccine, but the reports of cases are not always clear. This writer apparently makes no serious attempt at the classification of the joint conditions he treats. The third reference is a purely experimental study and has no bearing on the use of vaccines in treatment. The fourth article was admitted by the manufacturer to be "negative as regards evidence." The fifth reference specifically states that "the vaccine must be autogenous." The sixth reference deals with the experimental production of appendicitis by the use of diplococci, and has not the most remote bearing on the use of vaccines in the treatment of rheumatism.

Streptococcus-Viridans-Combined-Bacterin.—The article which bears evidence of more care than the others admits that we are not in position to state the value of vaccines in pyorrhea but the author believes they may have value supplementary to local treatment.

It is not surprising that a large number of favorable reports can be accumulated when we appreciate how promptly men report what they consider to be their successes and how commonly they leave their failures unrecorded. Bearing in mind the fact that these stock mixed vaccines, though before the profession for many years, have not been used, or continued in use, in hospitals where work is rigidly controlled and that they are used practically not at all in the large government hospital service, a candid critic must hold that there is no substantial evidence in favor of the therapeutic use of a mixed vaccine, certainly not for stock "goods" and that probably there is but a limited field for the employment of autogenous vaccines.

The referee calls attention to a shift in the advertising matter on vaccines—the tendency to recommend vaccines to be used in conjunction with drugs. A heading in the Abbott booklet reads, "The Biologics Do Not Replace Drugs"; and the paragraph speaks of serums and bacterins as "new tools, supplemental to those we already have, but not replacing them." . . . "We need them both."

The referee recommends that the several mixed vaccines discussed in this report be not accepted on the grounds that satisfactory evidence of their value is wanting.

Having been endorsed by the Committee on Serums and Vaccines the Council adopted the report and declared M. Catarrhalis-Combined-Bacterin, B. Coli-Combined-Bacterin, Pertussis-Combined-Bacterin, Streptococcus-Rheumaticus-Combined-Bacterin and Streptococcus-Viridans-Combined-Bacterin ineligible for admission to New and Nonofficial Remedies.

Catarrhal Vaccine Combined-Lilly and Influenza Mixed Vaccine-Lilly

Because of inquiry received, the Council requested Eli Lilly and Company to aid in determining the acceptability of the following products for New and Nonofficial Remedies: "Catarrhal Vaccine Combined," said to contain killed cultures of the Bacillus of Friedländer, Micrococcus catarrhalis, Staphylococcus aureus and albus, Pneumococcus and Streptococcus; "Influenza Mixed Vaccine," said to contain killed cultures of Staphylococcus albus and aureus, Streptococcus, Pneumococcus, Micrococcus catarrhalis and Bacillus influenzae.

Lilly and Company sent the circulars, etc., used in advertising these products. A circular for "Catarrhal Vaccine Combined" contained the following claim:

> "Catarrhal Vaccine has been especially useful in many respiratory infections, including bronchitis, pharyngitis, rhinitis, chronic catarrh and in the mixed infections of pulmonary tuberculosis."

A circular for "Influenza Mixed Vaccine" contained the following:

> "The vaccine is useful in the treatment of influenza and ordinary colds, and in any infection in which the Bacillus influenzae is the causative agent."

An advertising pamphlet contained the following:

> "Catarrh, Acute and Chronic; Colds, *Influenza.*—The micro-organisms capable of producing catarrhal conditions of the nose and pharynx and most commonly isolated are B. Friedländer, M. catarrhalis, staphylococcus, pneumococcus (in infections beginning in the larynx), B. *influenza* and streptococcus. These organisms are found normally in the respiratory passages and acquire virulence only when resistance has been lowered through overwork, exposure to cold, etc.
>
> "The results following the use of Catarrhal Vaccine Combined (in the non-epidemic forms) and Influenza Mixed Vaccine (in the epidemic types) have been very satisfactory, due to the great vascularity of the tissues. Acute attacks are aborted altogether or shortened in duration and the danger of complications greatly minimized."

No evidence was submitted which warrants the preceding claims nor is the Council aware of any reliable testimony to indicate that the administration of the mixtures here discussed is warranted or desirable. On the recommendation of the Committee on Serums and Vaccines the Council voted that "Catarrhal Vaccine Combined-Lilly" and "Influenza Mixed Vaccine-Lilly" *be not included* in New and Nonofficial Remedies because satisfactory evidence of their value is wanting.

Influenza Serobacterin Mixed-Mulford

Because of inquiry received, the Council took up the consideration of "Influenza Serobacterin Mixed-Mulford," and requested the Mulford Company to present evidence to establish the admissibility of the preparation to New and Nonofficial Remedies. The Mulford Company sent specimens of the serobacterin in question, an advertising circular and a letter by the director of its Biologic Laboratories.

According to the label on the package, the preparation is made from the following organisms: Bacillus influenzæ, Staphylococcus aureus, Staphylococcus albus, Streptococcus, Pneumococcus and Micrococcus catarrhalis (group). This mixture is recommended by the manufacturer:

> "For the prophylaxis and Treatment of Common Colds, Mixed Infections of the Respiratory Mucous Membranes, Acute and Chronic Catarrhal Conditions of the Nose, Throat and Respiratory Passages."

No evidence is submitted for this recommendation except that in "colds and bronchitis and the other common infections of the upper respiratory passages . . . five or six bacteria are very commonly present—two or more of them are nearly always present . . . ." and the letter by the director of the Mulford Biologic Laboratories expressing the belief that in his own case the use of the mixed vaccine has aborted or prevented colds.

As regards the use of this complex biologic preparation:

First, the cause of common colds is, at the present time, quite unknown. One of the most striking things is that at the beginning of a cold the organisms to be cultivated from the nasal mucous membrane are very few in number and there is no uniformity in the type of organism found. If some one of the well-known organisms (Streptococcus, Staphylococcus, Pneumococcus, Micrococcus Catarrhalis, Influenza Bacillus, etc.) were responsible, we should expect to find one of them preponderating and in overwhelming numbers. This is far from the case. After the duration of the cold for a day or two with the increased production of mucus and apparently with the infection of a mucous membrane whose powers of resistance have been greatly lowered, bacteria of all kinds are to be found in immense numbers. There is considerable reason for believing that an ultramicroscopic organism is responsible for this condition (See Foster, *Journal of Infectious Diseases*, November, 1917, **21**, 451).

Second, there is no acceptable clinical evidence that vaccination with the influenza bacillus, the Streptococcus, the Pneumococcus or the Micrococcus Catarrhalis will influence the course of an infection due to one or the other of these organisms. It has been repeatedly found that a staphylococcus vaccine is of a certain degree of value when the infection with the staphylococcus is localized, but it is well known that general systemic infections with the staphylococcus are not at all benefited.

Third, the letter submitted as evidence by the Mulford Company is not convincing. The Council is not prepared to accept evidence of this sort unless it is in volume large enough to justify a definite conclusion.

Holding that there is no evidence for the value of this mixture, the Council declared "Influenza Serobacterin Mixed-Mulford" inadmissible to New and Nonofficial Remedies because its use is illogical.

Sherman's Mixed Vaccine No. 40

Because of inquiry received the Council decided to consider this preparation and requested the manufacturer, G. H. Sherman, Detroit, Mich., to submit evidence in support of the claims made for it.

This vaccine is said to be made from killed cultures of Streptococcus, Pneumococcus, Micrococcus catarrhalis, Staphylococcus aureus, and Staphylococcus albus. In the printed matter sent out by G. H. Sherman this vaccine is recommended for hay-fever, in which it is stated that some of the symptoms are due to bacterial invasion of the respiratory mucosa; for tonsillitis, both as a remedy and as a prophylactic against rheumatic and other sequelae; for "throat infections"; for rhinitis with the claims that acute coryza can be aborted within twenty-four hours; for pneumonia in which it is advised for all stages; for laryngitis, for bronchitis, and for asthma.

No acceptable evidence was submitted as to the value of the product in the treatment of any of the foregoing conditions. In view of what is known about non-specific reactions, it seems likely that any influence which this vaccine may have on the divers conditions enumerated by the manufacturer, is due to this, rather than to the combination of organisms used in its preparation.

On the recommendation of the Committee on Serums and Vaccines, the Council declared "Sherman's Mixed Vaccine No. 40" ineligible to New and Nonofficial Remedies because the therapeutic claims made for it are unwarranted (Rule 6) and because the combination, in view of its complexity, is irrational and detrimental to sound therapy (Rule 10).

Correspondence

PROCAIN AND NOVOCAIN IDENTICAL

To the Editor:—It appears that in certain quarters the attitude is taken that the local anesthetic sold as procain is not identical with that marketed as novocain. The Subcommittee on Synthetic Drugs of the National Research Council believes it important that this misunderstanding should be corrected and hence offers the following explanation:

The monohydrochlorid of para-amino-benzoyldiethyl-amino-ethanol, which was formerly made in Germany by the Farbwerke, vorm. Meister, Lucius and Bruening, Hoechst A. M., and sold under the trademarked name "Novocaine," is now manufactured in the United States. Under the provisions of the Trading with the Enemy Act, the Federal Trade Commission has taken over the patent that gave monopoly for the manufacture and sale of the local anesthetic to the German corporation, and has issued licenses to American concerns for the manufacture of the product. This license makes it a condition that the product first introduced under the proprietary name "Novocaine" shall be called procaine, and that it shall in every way be made the same as the article formerly obtained from Germany. To insure this identity with the German novocain, the Federal Trade Commission has submitted the product of each firm licensed to the A. M. A. Chemical Laboratory to establish its chemical identity and purity, and to the Cornell pharmacologist, Dr. R. A. Hatcher, to determine that it was not unduly toxic.

So far the following firms have been licensed to manufacture and sell procain: The Abbott Laboratories, Ravenswood, Chicago; Farbwerke-Hoechst Company, New York; Rector Chemical Company, Inc., New York, and Calco Chemical Company, Bound Brook, N. J. Of these, the first three firms are offering their products for sale at this time, and have secured their admission to New and Nonofficial Remedies as brands of procain which comply with the New and Nonofficial Remedies standards.

While all firms are required to sell their product under the official name "Procaine," the Farbwerke-Hoechst Company is permitted to use the trade designation "Novocaine" in addition, since it holds the right to this designation by virtue of trademark registration.

In conclusion: Procain is identical with the substance first introduced as novocain. In the interest of rational nomenclature, the first term should be used in prescriptions and scientific contributions. If it is deemed necessary to designate the product of a particular firm, this may be done by writing Procaine-Abbott, Procaine-Rector, or Procaine-Farbwerke (or Procaine [Novocaine brand]).

Julius Stieglitz, Chicago.
Chairman, Subcommittee on Synthetic Drugs, National Research Council.

Comment.—Physicians should adopt the Federal Trade Commission's recommendation to use the official name of the licensed drugs in connection with all written articles and prescriptions, and if the proprietary brand name is to be used, to place this side by side with the official name.

The official names so far adopted by the Federal Trade Commission are:

Arsphenamine for salvarsan, diarsenol and arsenobenzol, etc.
Neoarsphenamine for neosalvarsan, neodiarsenol and novarsenobenzol, etc.
Barbital for veronal.
Barbital-sodium for medinal and veronal-sodium.
Procaine for novocaine.
Procaine nitrate for novocaine nitrate.
Phenylcinchoninic acid for atophan.

SERUM DIAGNOSIS OF SYPHILIS

To the Editor:—Regarding the communication of Dr. Hindman (The Journal, May 25, 1918, p. 1561) in which he states that "sodium acetate [recommended by me for preservation of complement, The Journal, Sept. 22, 1917] forms a precipitate with some guinea-pig serums," let me state, after considerable experience with this method, that no such precipitate occurs from acetate solutions up to 25 per cent. strength. Solutions above this strength may cause a crystalline precipitate, which can be sedimented off and does not interfere in any way with the complement fixation reaction.

In regard to his observation as to the possibility of getting a negative reaction in a weakly positive case, on account of the sharp reaction or possible overaction of acetated complement, allow me to suggest that this is a matter entirely of exact technic.

In my experience, which has been entirely with guinea-pig serum, I found that in using acetated complement in which the complementary unit has been stabilized, one must be much more exact in the technic (as excess would give overactivity) than in handling an unpreserved complement in which the complementary activity is constantly diminishing, especially in warm weather.

Therefore the unit not only of the guinea-pig complement but also of the amboceptor, the antigen and the complementary unit for each individual batch of red cells (see my note, The Journal, Nov. 17, 1917, p. 1728) must be determined by titration. If, then, the patient's serum is inactivated to do away with its varying content of complement which would act as excess, one will not, when using titrated units of acetated complement, get any negative reactions in weakly positive cases.

Captain, M. R. C., U. S. Army.

THE CONTROL OF VENEREAL DISEASE IN THE ARMY

To the Editor:—Owing to the great interest awakened in the morbidity of venereal diseases incident to the prime necessity of a supply of healthy, vigorous manhood with which to win the war, the public is now learning how vitally necessary it is to keep undefiled the spring of that stream not alone by sanitary regulations of extracantonment zones but also of the cities and towns from which our soldiers enlist or are drafted.

We all know the report, how well founded I cannot say, that Germany sent a flood of prostitutes to infect and disable the French and British troops; but whether Germany had anything to do with it or not, the soldier in the hospital from a venereal disease is just as much a noncombatant as a soldier disabled in combat. Moreover, he occupies and demands shelter, medicines, transportation, beds, bedding, nurses and doctors, all of which tax the military resources and to which he should not be entitled since he takes an oath to defend the United States against all their enemies and not to go to bed sick and to that extent aid Germany.

Now that we are alive and anxious to do, for military reasons, what we would not do for purely moral reasons or public health reasons in time of peace, we see plainly that prostitution is pro-German and that every one engaged in the occupation of prostitution or aiding or abetting it by pandering or renting rooms or buildings for its practice is an enemy of the Republic and pro-German.

I believe, therefore, that as a legal measure two things would cut to the root: 1. Punish all landlords, hotel managers, boardinghouse keepers and other persons who maintain places for the practice of prostitution by a term of years in a penitentiary. 2. Punish all prostitutes by restraint in internment camps for treatment and segregation during the war. I do not suggest fines because the traffic is already burdened with high rentals and graft bribes and could no doubt stand more, because those whom this act is designed to reach will gladly pay a nominal fine, viewing it very lightly, too, as a tax laid by the state on the traffic, which is a matter to our minds unthinkable.

Frank Thomas Woodbury, M.D.,
Camp Gaillard, C. Z.
Lieutenant-Colonel, M. C., U. S. Army.

"THE VALUE OF THE WASSERMANN REACTION"

To the Editor:—Referring to the article "The Value of the Wassermann Reaction: A Reply," by Drs. Larkin, Levy and Fordyce (The Journal, June 1, 1918), may I ask the courtesy of a few lines of space; although Dr. Symmers needs no protector, the responsibility for publishing Dr. Symmers' article which they criticize being entirely mine. At a future date Dr. Symmers will answer the points which the authors criticize.

The article by Dr. Symmers was read and approved by me as director of laboratories of Bellevue Hospital at that time. Dr. Symmers had nothing to do with the performance of the Wassermann reactions. The methods employed in the pathologic department of Bellevue Hospital are well known, as a description was published by Dr. Cyrus W. Field, and they thus became public property. I might add that Dr. Field and myself were members of the committee appointed by Dr. Haven Emerson several years ago to bring harmony of methods into the various laboratories, public and private, of New York City, and that, therefore, we believe ourselves to be entirely familiar with the details of the technic of the Wassermann reaction. The laboratory at Bellevue Hospital was one of the first to make routine Wassermann examinations, and for several years every patient entering Bellevue Hospital and remaining for a period of three days or longer was thus investigated, so that many thousands of reactions have been made. Bellevue Hospital was fortunate, moreover, in having the expert services of serologists of repute, such, for example, as Dr. Cyrus W. Field, and their co-workers were always men of training and ability.

In regard to the matter of careless postmortem observations, I may state that, as director of laboratories of Bellevue Hospital, I saw most or nearly all of the necropsies and personally corrected all postmortem records during the thirteen years of my incumbency. Any fault that is to be found with the observations is largely mine, and I am willing to assume the responsibility for it, although in fairness to Dr. Symmers it should be stated that, during practically the whole of the Wassermann era, he has been actively associated with me at Bellevue Hospital and has acted in an advisory or supervisory capacity in a great many additional postmortem and microscopic investigations.

The assumption of Drs. Larkin, Levy and Fordyce that because no mention of histologic examinations was made in the paper by Dr. Symmers, this branch of activity at Bellevue Hospital is neglected, is unwarranted, since it has always been one of the rigid rules of the laboratory to keep pieces of the viscera of all bodies coming to necropsy, and in the great majority of cases the histologic preparations still form part of the laboratory records. I should also like to call attention to the fact that Drs. Larkin, Levy and Fordyce have been guilty of the negligence of which they accuse us, namely, they do not state the methods by which they have come to the conclusion that they were dealing with syphilis. Moreover, in detailing the remarkable successes which they have had, clinically and pathologically, with the Wassermann reaction, they neglect to detail the serologic methods employed, while at the same time they severely criticize Bellevue Hospital for a like omission, in spite of the fact that a report of our methods has been published.

Charles Norris, M.D., New York.
Formerly Director of Laboratories, Bellevue and Allied Hospitals.

SLOUGHING OF GUMS AFTER INSTALLATION OF GOLD BRIDGE

To the Editor:—A perplexing problem presents itself here in my office which is associated with that of a dentist, Dr. J. Wallace. His patient was referred to me because of a sloughing of the mucous membranes of the mouth taking place thirty-six hours after a gold bridge had been placed therein. The sloughing seems most pronounced at the immediate point of contact with the gold, which was 22 carats fine. Phosphoric acid enters into the cement, but at the crown margin the sloughing is not pronounced. The symptoms are those of pronounced salivation. The cement used is Fellowship Cement. Could you shed some light on the subject? Many have used this cement without any ill effects, and this is the first case of this nature to come to my attention.

D. H. Pettingell, M.D., Ely, Nev.

Answer.—From the meager description of the case, it is difficult to solve the problem offered. However, it is certain that neither the 22 carat gold nor the cement used was a cause of the sloughing of the gums. If a local anesthetic was injected into the gums during the fitting or setting of the bridge, it may have caused the destruction of the adjoining tissues. This may follow the use of local anesthetics containing suprarenal products. It was rather soon for an infection to result, though the fitting of the abutments may have preceded the setting of the bridge several days. If this were the case, the gums may have been infected in the primary operation. The description leads one to think of what is known as Gilmer's disease—acute ulcerous gingivitis, or, as it is sometimes called, "trench mouth." Acute ulcerous gingivitis is due to the *Bacillus fusiformis.* It is a rather uncommon affection of the gums, commencing with ulceration of the gum margins about a few teeth. The gums are destroyed rapidly, leaving a grayish deposit not unlike that found covering the so-called "mucous patches." There is extensive salivation, slight rise in temperature, and fetid breath. The treatment is indicated by the nature of the organism causing it, which is an anaerobe; that is, an oxidizing agent such as hydrogen peroxid, with a weak solution of potassium permanganate to offset the odor. Calomel in small doses is indicated.

Incineration.—The incineration of dead human bodies is a practice which, while desirable from the modern point of view, grows slowly on account of lack of popular knowledge concerning it, or on account of religious, superstitious or social prejudices. It needs the impetus of a strong, continuous propaganda to make it the sole method of disposing of the dead. Figures furnished by Dr. Charles Scott Miller, chief of the division of vital statistics of the bureau of health and charities of Philadelphia, show that from 1876, when the first crematory was built in the United States, to and including 1915, the total number of bodies incinerated in the United States was 110,012, and only since 1913 has the annual figure reached the 10,000 mark. In 1913 the number was 10,183, in 1914 it was 11,239, and in 1915 it was 12,767. At present about half the states have crematories. The tremendous impetus given by the war to the study and practice of better sanitation should include a better knowledge and extension of incineration of the dead. While distinctly a sanitary question in some of its aspects, the matter of incineration of the dead, when rightly understood, should appeal even more strongly to sentiment as compared with earth burial.

Montana April Examination

Dr. S. A. Cooney, secretary of the Montana State Board of Medical Examiners, reports the written examination held at Helena, April 2-4, 1918. The examination covered 10 subjects and included 50 questions. An average of 75 per cent. was required to pass. Of the 17 candidates examined, 12 passed and 5 failed. The following colleges were represented:

College	Year Grad.	Per Cent.
PASSED		
Chicago College of Medicine and Surgery	(1917)	75
Loyola University	(1916)	79.2
Rush Medical College	(1897) 77.5; (1901) 81.5; (1917)	78.1
State University of Iowa College of Medicine	(1891)	77.9
University of Louisville	(1892)	82.2
Maryland Medical College	(1903)	75.2

Physician Entitled to Damages for Eviction of Trespass

(Grammont Holding Co., Inc., v. Lellmann (N. Y.), 168 N. Y. Supp. 29)

The Supreme Court of New York, Appellate Term, First Department, in reversing a judgment obtained by the plaintiff, and granting the defendant, a physician, a new trial, with $30 costs to him to abide the event, says that this action was brought to recover for rent of an apartment in a house owned by the plaintiff. The only matter litigated was the counterclaim of the defendant physician, based on acts of the plaintiff during the defendant's occupancy, which resulted in his abandonment of the premises. It appeared that the plaintiff undertook to reconstruct its building; that in the course of that work it disconnected the telephone service, stopped the operation of the elevator, and attempted to run pipes through the defendant's apartment; and that as a result of the work in the building water and large quantities of dust and plaster entered the apartment occupied by the defendant. There were also continuous loud noises and shocks generally accompanying the performance of the work which shook the premises. The defendant claimed damages by reason, among other things, of interference with his business as a practicing physician, and expense entailed in moving. The plaintiff urged that damages for an eviction were limited either to a nominal figure or at most to the difference between the rental value of the premises as they were and the rent reserved in the lease, but conceded that, in case the interference with the leased premises amounted substantially to a trespass, a more liberal measure of damages would be applicable. The evidence here presented a case wherein, short of deliberate personal violence offered to the defendant, the proof of trespass on the leased premises was overwhelming. By the very rule conceded by the plaintiff, therefore, the defendant was entitled to prove at least the loss of business which he suffered by reason of such interference. It was unnecessary to pass on all the items of damage which the defendant claimed and undertook to prove, as the evidence was excluded by the trial court. Indeed, the defendant's position did not rest solely on an eviction, but might perhaps with equal force be sustained on the theory of trespass alone.

Adulteration with Saccharin

(People v. Excelsior Bottling Works, Inc. (N. Y.), 168 N. Y. Supp. 570)

The Court of Special Sessions, City of New York, holds that the defendant, in keeping and offering for sale a beverage called strawberry soda, which contained saccharin, was guilty of violating Section 68 of the Sanitary Code of the board of health of the department of health of the city of New York, prohibiting the having, selling, or offering for sale of any adulterated or misbranded food, including beverages. The court holds that this section and a resolution of the board of health, to the effect that foods containing saccharin shall be deemed adulterated, were passed in pursuance of a reasonable exercise of the public power; and that they are not obnoxious, in any respect, to the provisions of the constitution of the United States, or of the constitution of the state of New York. The opinion of Chief Justice Russell says that the testimony in this case was very voluminous and covered about 477 pages of stenographic minutes. Eighteen witnesses were examined at length, several of whom were world-famed scientists, and eminent in the medical profession as food experts. This record, at least, showed that there is a difference of opinion among those best qualified to judge respecting saccharin and on the question of excluding it from foods. Saccharin is a substitute for sugar, and itself has no food value. Under the authorities, although as an ingredient of food it may not be deleterious, still its use can be absolutely prohibited. An article may be manufactured in imitation or semblance of a well known article in common use, and consumers or purchasers may be thus imposed on. Legislation intended to prevent such an article from being manufactured has been held valid. The legislature certainly cannot forbid or wholly prevent the sale of a wholesome article of food. But in forbidding the sale and use of saccharin as food, no attempt was made to prevent the sale of a wholesome article of food. Saccharin is not a food, but a product of coal tar, a synthetic substance from a laboratory. The object of such regulation was to prevent imposition and fraud. Nor will a suitable label afford a sufficient protection to the public against fraud. The blind and illiterate are entitled to the full protection of the law. Then, too, a certain amount of nourishment will surely be lost if saccharin is permitted to displace sugar as a sweetener.

Liability for Representations and Negligence or Incompetence of Physicians

(Denver & R. G. R. Co. v. Ptolemy (Colo.), 169 Pac. R. 541)

The Supreme Court of Colorado reverses a judgment obtained by the plaintiff for damages for personal injuries, because it holds that the evidence failed to justify the setting aside of a settlement previously made in consideration of the payment to her of $450, but which she alleged that she was induced to accept by reason of the false and fraudulent representations made to her by the defendant company's claim and by its physician as to her condition and the nature and extent of her injuries. The court says that the plaintiff had the burden of proving the charge that the defendant's agents—the physicians and the claim adjuster—deliberately and consciously misrepresented to her her physical condition, with intent to induce her to make the settlement, and that she was thereby induced to make it. To prove fraud the evidence must be clear, precise and indubitable. It could not be said that such evidence was presented in this case. The plaintiff herself testified only that the physician who had entire charge of the case, after her first day in the hospital, and during her stay there, stated "as his opinion" that her injuries were not serious. She now complained that she was, in fact, suffering from internal injuries, but in at least two places in her brief it was said that the defendant's physicians failed to discover such injury. Clearly, then, they were not and could not be guilty of fraudulent misrepresentation as to that injury. If they failed to discover it, that might indicate negligence on their part, but that was no part of the issue made by the pleadings. If the physicians were negligent or incompetent, the defendant would be liable for the results of such negligence or incompetence only in case it appeared that the defendant knew or should have known of the physicians' unfitness, and that, too, in a case wherein the pleadings presented that question. A physician's diagnosis is necessarily a matter of opinion, except in cases wherein the ailment is external and visible. There was in this record no evidence which even raised a suspicion that the statements made to the plaintiff as to her condition were not made in perfect good faith. Neither of the physicians who attended her for the defendant was present at the settlement, nor did they at any time take part in the negotiations for it. The attempt to invalidate the contract of settlement wholly failed.

Testicle Held to Be Member of Body

(State v. Sheldon (Mont.), 169 Pac. R. 37)

The Supreme Court of Montana, in affirming a conviction of the defendant of the crime of mayhem in depriving a man of his right testicle, says that the sufficiency of the information depended on whether the right testicle of a male human being is "a member of his body" within the meaning of Section 8304 of the Revised Codes of Montana defining the crime of mayhem, and that the court thinks it so obviously is that any discussion of the matter is unnecessary. The contention that it is not was based on the claim that at common law the only members of the body within the definition of mayhem are those directly useful in fighting, such as to enable one to defend oneself or to annoy one's adversary. But however this may be, and there is room for doubt about it, the answer is that the Montana statute is not so restricted.

Social Medicine, Medical Economics and Miscellany

THE GREAT MELTING POT

The Amalgamation of Our Citizens Through the War

The Ambulance des Alliés, as its title implied, was equipped and operated for the Allies; at least that was the interpretation put on its name by the chief surgeon—an American. Consequently, when in due course of time our —th Division quietly slipped in and occupied an adjoining sector, where they literally rubbed elbows, company by company, with their French comrades in arms, proper steps were at once taken to receive our Amex's and give them a touch of home life. As this particular sector was only to be temporarily occupied by our troops, it had been judged more expedient not to have any of our sanitary formations in the zone of the lines of communications. A wounded American received first aid at his regimental aid station, from which post he was sent back to a French evacuation hospital for further treatment. As the Ambulance des Alliés was operated under the administrative supervision of the French Service de Santé, the transfer of wounded Americans to our formation presented no formidable difficulties. Our hospital boat could go up the river as far as division headquarters, making the question of transportation an exceedingly simple one.

When the first group of our wounded boys arrived in ambulances at the boat landing, saw the nurses in their smart uniforms, and heard the English language spoken, after having spent several days in a French hospital, they burst into tears.

A perusal of their "diagnosis tags," followed by short chats with one after the other of the first fifty or so American admissions, suggested the title for this story. Armenia, Ireland, Italy, Poland, Russia, Sweden, and the French province of Canada were all represented, often in the same company. A sturdy descendant of the Pilgrim fathers was flanked on either side by an offspring of the Ghetto and a Swedish emigrant; a Polish factory boy tried to converse in broken English with his neighbors, a French Canadian on one side, an Italian on the other; an irrepressible Irish lad flung Bowery jokes at an Armenian, the latter smiling his polite misunderstanding. They were all Americans, all doing their "bit" for the common cause of liberty; what mattered a few generations more or less, spent on American soil? "We tutti have to crossa da bigga oceano soma tim," said Tony Damiano.

Ah! the proud look on the boys' faces as they one and all vouchsafed the information that they were not drafted but had volunteered. That the Middle West is the *great melting pot* for the downtrodden masses of the Old World is a fact long admitted by all; but that this particular division, recruited in the New England States, should contain the same elements in its cadres was interesting and significant.

Beppo Yanko, called "Macaroni" by the nurses, was as handsome a specimen of southern Italy as one could wish to see. His birthplace was Calabria, his country: "Me Americano, voluntario! Me landa en America at ten years; me liva en Lawrence, Mass.—do averything—shina da shoe, worka da shov', sella da banan; Guerra he come, me fighta for ma new country; me soldier boy, var' fina ting; me wounda in da leg by big Germ'; me killa da son-of-a-gun, no care go-dam; killa some more soma day!" Good old macaroni! In spite of his queer handling of the English language, his comrades respected and treated him as one of their own—as a pal.

Maddy Archambault, lineal descendant of a long line of "voyageurs," was following the career of a lumber jack in the Maine woods when the call came to him and he enlisted in the nearby village. With his knowledge of "habitant" French, which managed to be understood wherever he went, Maddy had, immediately on landing in France, become the unofficial interpreter, go-between and purchaser of "extras" for his company mess. A quiet, modest, retiring sort of lad was our Maddy, yet, on his breast was the coveted Croix de guerre, which a French general had pinned on him for conspicuous bravery. His face and arms had been badly peppered by shrapnel, which made the boy sometimes wonder whether his best girl at home, up in the Maine woods, would still favor him with her smiles when he returned. Old boy, if Angéline is the right sort of girl, she will fasten her adoring and admiring eyes on your military cross, and feign not to see the absence of part of your nose and upper lip. Bon courage and good luck to you. With Duplessis, Labelle and Leclerc—all good old French Canadian names—you formed a quartet of sterling fighters; would that more of your kind could slip across the border and enter our army.

Iky Rhozinski, typical product of any large city ghetto, felt the importance of his new rôle in society. Gone were the sloping shoulders, pussy-foot gait and shifting eye, inherited traits which are the natural result of centuries of persecution. Iky stood like a flagpole and looked you straight in the eye; he had been wounded "in line of duty," suffered uncomplainingly and was secretly very proud of his bandaged and splinted limb; he felt that he was an American, and his comrades treated him as such.

To Walter Brodowski, Catholic, Iky should have been anathema, for there has never been any love lost between Catholics and Jews in unhappy Poland. The two frequently conversed together, now in broken English, now in Polish, apparently on the very best of terms.

Walter—he confided to me that he had been baptized Stanislas but had found Walter more comfortable for school purposes—was a typical Slav with tawny hair, high cheek bones, low forehead, dilated nostrils, large mouth and sad blue eyes. Several years of premature factory life had given him that dull, hopeless look so familiar to settlement workers. He was doing his manly best to overcome the old handicap, but it still lingered in gait and facial expression. Six months from now, if all goes well with him in the meantime, Stanislas will be completely emancipated from the old fetters, which had been prematurely crushing and aging him at home. He will be a real man. Just what his attitude will be toward his prewar "job" when he returns is one of the big problems for our sociologists to work out. Where are we going to get our future factory slaves from? Is a man who has breathed God's fresh air, slept under the starry heavens, and faced death unflinchingly going to return to the States in order again to punch the time clock and be known as plain No. 975, d—d Pollak?

Of course Timothy O'Neil had freckles, carroty hair, a stub nose and "pug" chin. Tim, enlisted belligerent in B Co., Nth Infantry, entered the hospital with "mitts" clenched and an angry gleam in his eye. Shot through the left foot, with the wound badly infected and needing immediate surgical attention, Irish Tim announced to all who cared to listen to him that it would take ten nurses and six surgeons to get him into the operating room. "Tim, my boy," said the surgeon quietly, patting him on the shoulder, "you will have to have your foot drained if you don't *wish to lose it*; take these crutches, walk with them to the operating room, and climb on the operating table yourself." Blue eyes looked into equally blue eyes for a few seconds; then a sheepish grin slowly spread over the lad's face as he picked up the crutches and said, "Yes, sir." From that moment, Tim became the star patient of his ward. Full of grit and determination, fairly bubbling over with native wit, he constituted the only necessary tonic, disbursing this commodity in continuous heroic doses. My last recollection of Tim, before a hurried evacuation to a safer zone, was when, leaning on his friendly crutches, he played ball with Iky—also on crutches—in the hospital yard, before an admiring crowd of convalescent English, French and American soldiers. Both were good pitchers and catchers; both stopped overhead balls with a crutch, and nobody sighed for a pennant game that day. How quickly a scene can change during war time! That same courtyard has, since that last happy afternoon, resounded with the daily and nightly rumble of ambulances, bringing in desperately wounded men to us from the nearby improvised lines.

Yan Jansen—no need to tell you that he was of sturdy Norse descent—had grown up to be a famous ski jumper 'way back in Minnesota; he was also an expert lumberman, and had been coaxed to the Maine woods by the lure of war wages and a foreman's job. Neither job nor wages had been able to still the great call to duty, and Jansen had become an excellent ambulance driver, assigned to a French division which occupied a nearby sector. Of his Scandinavian origin, only the name and physique remained, for Yan had finished high school at home and now spoke French with a fluency which made him the envy of his less linguistically inclined comrades.

John Arda, a handsome, black haired, dark eyed Armenian, had given up pedling imitation Oriental rugs in Boston in order to show his gratitude toward his new fatherland. This was truly a holy war for John; his people in Armenia had not been heard from for two years, and he had given them up for dead—or worse. His face would light up with long suppressed passion as he recounted the tales of unprintable atrocities committed on his people under the guise of Kultur. Well did he know at whose door in Potsdam lay the real blame; whose were the brains which had engineered the wholesale Armenian deportations. Though wounded, Arda felt that he had given more than he had received, and he was eager to meet Fritz again and again on the battlefield.

As for the American-born Sammies—genuine Yankees most of them—they were in France because the honor of their fatherland had been trampled underfoot and they had enlisted in order to right a hideous wrong. Splendid, lovable fellows, all of them, many were mere children in worldly wisdom; a few of the older ones more or less sophisticated. With their strong, though boyish-looking faces, their manifest intelligence and splendid physique, they were the admiration of their French comrades. With the help of a smile, a hand-shake and a cigaret, new and mutually valuable international friendships were soon formed, and it was a joy to see Sammies and Poilus, on a sunny afternoon—rare treats, alas, in this part of France—basking in the sun and carrying out all sorts of impossible conversations in Frankingle or Inglefrank—depending on whether French nouns and verbs were being anglicized or English nouns and verbs were frenchified.

What a liberal education for one and all of them; what a rare opportunity for free exchange of thought! After this hideous war is over, will there evermore be such a thing as a d—d foreigner—at least among the Allies? Will not this great cataclysm which has befallen the civilized world, save the mark, bring about a better understanding among the people who have been gasping and struggling in our great melting pot? If it does, we, at home or in the field, will almost feel repaid for the suffering we are enduring and the sacrifices we are making, in order to see the struggle through to a victorious end.

George de Tarnowsky, France.

Major, M. C., U. S. R.

THE FRAMINGHAM EXPERIMENT IN TUBERCULOSIS

A report on the progress of the Framingham Community Health and Tuberculosis Demonstration has been issued in Monograph 1, Publication 1 of the General Series of publications which will be issued regarding the experiment. It is planned to issue three series of reports, the first a general series covering the program itself, educational, social and economic, a second medical series presenting the results of the health census, medical examination, tuberculin survey, etc., and a third sanitary series covering reports and statistics of sanitary and hygienic conditions among infants, in schools, factories, etc. The demonstration has been in operation a little more than a year, and this first publication gives an account of the foundations which have been laid. The main objectives are summarized as the thorough medical examination of a substantial proportion of the population, the discovery of tuberculosis, and lending assistance to the community in organizing its forces to meet its own health obligations. Under this plan expert examinations have been made of 5,000 persons, about one third of the population, with the object of discovering and placing under treatment and observation incipient, advanced or arrested cases of tuberculosis, of which about 200 have been found; a sanitary survey has been made covering infant conditions, schools, factories, food, milk, rural sanitation, vital statistics, etc.; a health census, a patriotic census of the man power resources of Framingham; a von Pirquet tuberculin survey of children between 1 and 7 years of age; a health camp for children; standards for the diagnosis, classification and treatment of children and adults, domestic science classes and home economic classes, the development of health educational work, etc., have also been among the accomplishments of the first year. The details of each of these divisions of effort will be given in subsequent publications.

Washington State Medical Association, July 10.
Western Roentgen Society, Colorado Springs, June 27-28.
Wyoming State Medical Society, Casper, Aug. 7.

THE AMERICAN GYNECOLOGICAL SOCIETY

Forty-Third Annual Meeting, held at Philadelphia, May 16-18, 1918

(Concluded from page 1885)

The Bladder of Women After Operation

Dr. Arthur H. Curtis, Chicago: Postoperative catheter cystitis is really urinary tract infection caused by residual vesical urine. An essential feature in the treatment of postoperative cases has been the prevention of urine stagnation in the bladder. In 465 consecutive operations the patients have been managed thus: All who complain of vesical distress are catheterized. Also, even when the power to void urine is present, catheterization is performed if residual urine is suspected. Furthermore, those patients who have required repeated catheterization are thereafter catheterized once daily immediately after urination, as long as residual urine is obtained. At the time of catheterization, 15 c.c. of one-eighth per cent. silver nitrate is instilled before the catheter is withdrawn. Medication consists of hexamethylenamin in amounts sufficient to maintain a positive formaldehyd test. In the presence of alkaline urine, acid sodium phosphate is added. Those who show idiosyncrasy to hexamethylenamin, or whose urine yields no formaldehyd, are treated with alkalis. In the presence of urinary tract infection, meats are permitted only twice a week. Seasonings of all sorts are forbidden, salt excepted. Sugar, sweets and pastry are limited. Under this plan, postoperative bladder troubles have disappeared. Retention of urine is a factor of the utmost importance in the etiology of pregnancy pyelitis. It is urged, therefore, that obstetric patients be tested for residual urine whenever carefully collected specimens reveal pus and bacteria. Through judicious catheterization, immediately after urination, these patients can often be saved from the danger of pyelitis.

DISCUSSION

Dr. John A. Sampson, Albany, N. Y.: After a radical operation for carcinoma of the cervix, severe cystitis is a common complication. I attribute the bladder disturbance to interference with the blood supply and with its function. Some of these patients, in whom there was incidentally a vesicovaginal fistula, were not troubled with cystitis, and I even went so far as to suggest that possibly in these severe cases the formation of a vesicovaginal fistula temporarily would obviate the cystitis. One of the most important ways of treating a severe cystitis is to establish free drainage and rest.

Dr. Guy L. Hunner, Baltimore: I agree that retention of urine is, perhaps, the chief factor, and this is most often due to postoperative overdistention of the bladder. Interference with the circulation and traumatism to the bladder itself do not have an important bearing on the question of postoperative cystitis; but if these patients are allowed to go on after operation with overdistention of the bladder, we may get a partial paresis which may last for several days or weeks, creating a most favorable condition for infection to take place.

Dr. J. Riddle Goffe, New York: I should like to ask about the treatment after washing out the bladder.

Dr. T. J. Watkins, Chicago: We always pass a catheter as soon as the patient has any distress After a patient has been catheterized every two or three days, we also catheterize once a day after that until we are sure she is not carrying an excess of residual urine. Daily catheterization is stopped as soon as we are convinced that the patient is not carrying a large amount of stagnant urine.

Dr. LeRoy Broun, New York: To what extent do you find residual urine, and in what quantity?

Dr. T. J. Watkins, Chicago: We almost invariably find a crippled bladder in women who have had to be catheterized every two or three days. Patients that require catheterization very seldom carry stagnant urine.

Tubal and Ovarian Hemorrhage: Its Etiologic Relation to Pelvic Hematocele and Extra-Uterine Pregnancy

Dr. J. Wesley Bovée, Washington, D. C.: Trauma plays a part in producing these hemorrhages. Hemorrhage from the fallopian tube may occur from general conditions that similarly affect other tissues. Venous stasis from circulatory disturbances or pressure from tumors may reasonably be included in a list of its causes. Ovarian hemorrhage may be confined within the ovary, constituting one or more hematomas, or it may take place into the peritoneal cavity, producing, if abundant, a hematocele. No other organ of the body is so frequently the seat of hemorrhage as is the ovary. Stromal hemorrhage is commonly preceded by infection of the ovary. In but few cases have correct diagnoses been made before operation or necropsy. As to treatment, in the milder forms of the condition rest and anodynes may meet all indications. In the severer forms the same rules apply as are employed in the treatment of ectopic pregnancy.

End-Results of the Conserved Ovary

Dr. John O. Polak, Brooklyn: From a study of seventy-three reoperations on patients in whom one or both ovaries were conserved, we must draw the following conclusions: 1. Routine conservation without due consideration of the ovarian and contiguous pathologic condition as it exists in the individual case, is not good teaching. 2. Regeneration of the conserved ovary depends largely on the type and duration of the existing infection and the condition of the tunica of the individual ovary. 3. Even when the most detailed technic is observed, the ovarian circulation is impaired. 4. The retained ovary, without the uterus, is always a focus for possible trouble. 5. The life history of the retained ovary is of short duration, and the trophic influence of the diseased ovary has been overestimated. Finally, a cured patient has few nervous symptoms.

The Most Effective Methods of Preventing Venereal Diseases

Dr. J. Montgomery Baldy, Philadelphia: Legislation in the line of prohibition has proved a failure. Education has proved a failure. All methods, single and combined, used in the past have driven victims of the diseases to drug store clerks and quacks. The "holier than thou" attitude of the community has been most disastrous. The methods of control which give any promise whatever of success are the open treatment of the whole subject on the basis of sanitation, dealing with these venereal diseases as with any other class of diseases. The community must be taught that the old attitude in regard to these matters is erroneous. Hospitals must be forced to repeal any rules they may have prohibiting the admission of these patients to their wards. Superintendents assuming the attitude of fear of these diseases must be taught to change their attitude in these matters, or be driven out of the business. Hospital staffs must have full liberty of admission of such patients who in their judgment need hospital treatment. Hospitals running dispensaries must open special dispensaries for the treatment of these diseases. All advertisements in public places of a quack nature must be abolished, and in their place must be substituted notices of legitimate clinics at which such sufferers may apply. This class of patients must be taught that their confidence will be kept just as secretly as will their confidence in any other class of disease, and that they are perfectly safe in applying to hospitals for treatment. Hospitals must gradually provide free treatment for those suffering with these diseases who are unable to pay for them. The question of registration by physicians of patients at public boards of health, except in an extremely limited way, the name of the patient being not involved, is, to say the least, indiscreet if results are to be obtained.

Why the Midwife?

Dr. J. Clifton Edgar, New York: Hospital records bear out the fact that foreign-born women, after their first confinement under the care of the midwife, subsequently turn to the maternity hospital or a physician for obstetric aid. After a short residence in this country, the foreign-born woman does not usually persist in the employment of a midwife. Her ambition is eventually to be in a financial position enabling her to employ the services of a regular practitioner. During the existence of the Midwife Bellevue School, 235 midwives have been graduated; 5,125 confinements have been conducted by the pupils, 1,755 in the school, and 3,370 in the patients' homes, with a maternal mortality of 0.7 per cent. Only three patients died in the school itself, a mortality of 0.05 per cent. Six others died after being transferred to Bellevue for operation. The 5,125 patients cared for by the midwives of the Midwife School and in the patients' homes were practically all normal labor cases, as in fetal and maternal dystocia, and in bleeding cases, severe toxemia, and other abnormalities, the patients were sent to the Bellevue Obstetric Service for treatment. As far as the handling of strictly normal labor cases by the midwives go, the results have been excellent. The records indicate that little septic infection has resulted.

A plan for better and safer obstetrics in the outlying rural districts must recognize two main problems: 1. The best practical care of normal patients and, 2, the detection of abnormal patients and their care.

By education and supervision the midwife may be rendered reasonably safe for strictly normal labor, safe even for a minimum of sepsis, or for the prevention of ophthalmia neonatorum; but she is not safe, and no amount of education can fit the material which physicians have been brought in contact with, for the early care of prenatal complications, and maternal and fetal dystocia, which caused most of the infant and maternal mortality. Who should determine what is a strictly normal labor—the midwife? Never! She is incompetent to do so, and only the trained obstetrician can do so. The midwife can never stand on her own responsibility. For safe obstetrics the obstetrician *must* ever perform the prenatal examination and care. He must ever be at hand for the maternal and fetal dystocia of labor and the complications of the postnatal period.

Treatment of Puerperal Blood Stream Infection by Means of Arsphenamin (Arsenobenzol)

Drs. H. A. Miller and S. A. Chalfant, Pittsburgh: We have treated eleven cases of puerperal infection by means of arsphenamin (arsenobenzol) given intravenously, usually in 0.6 gm. doses, as frequently as three or four day intervals, giving from one to four doses. There were no toxic effects other than a mild albuminuria. Seven patients had a streptococcus in the blood stream, and two of them died; two had a gram-negative bacillus; both lived. Two had a negative blood culture, but were classed as cases of bacteremia clinically; both died. Two patients had intra-uterine irrigations with neutral solution of chlorinated soda at two hour intervals. One recovered and one died. In the fatal case, necropsy revealed the uterus free from infection. Death was due to multiple abscesses of both kidneys. With the intravenous injections of arsphenamin we have been able to rid the blood stream of its invading organism in every instance. All varieties of organisms so far encountered seem to be equally influenced. After arsphenamin has been given there is a marked increase in the leukocyte count. If, after this time, there is a decided decrease in the leukocytes, it is possible that the patient has reinfected herself, and arsphenamin should be given without waiting for confirmation of the culture report. The blood stream is usually found to be sterile in twenty-four hours, always in forty-eight hours, except in one case in which only 0.4 gm. of arsphenamin were given. Rabbit experiments indicate that a dose of 6 mg. is necessary to secure prompt results. In suspected blood stream infections, arsphenamin may be given immediately after a culture has been taken in order to avoid the delay incident to waiting for a laboratory report.

Two Hundred and Ten Fibroid Tumors Treated by Radium

Dr. Howard A. Kelly, Baltimore: Radium treatment, which is without danger and which is found effective in 93 per cent. of the cases, should be preferred to operation, which is, after all, a major operation of mutilating character offering considerable risk to life and health. The accomplishments of radium in this class of cases are: 1. Control of hemorrhage and checking of menstruation. 2. The shrinkage of the tumors. 3. In many instances the disappearance of the tumors. 4. In some cases, even after two years, the return of menstruation, either normal or scanty. There has been no mortality associated with the treatment of 210 consecutive cases. In 182 cases the results are known. In 171 radium alone was sufficient to relieve the patient. The tumor was either gone or markedly diminished, or the patient was symptomatically well. In five of the remaining eleven cases, some complicating condition was present (ovarian cyst, gallstones, calcified uterus); in two cases operation was preferred to further treatment; in three cases operation was found not to have been necessary, as the tumor had decreased under treatment; one case proved resistant to prolonged treatment. Nine of the eleven patients were operated on. If radium fails, the operation has simply been postponed without detriment to the patient. Menopausic symptoms are usually not severe. In 50 per cent. of the cases, no menopausic symptoms are complained of; in slightly more than 25 per cent. they are moderate and in slightly less than 25 per cent. they are marked.

Cancer of the Cervix Complicating Triplet Pregnancy

Dr. Benjamin P. Watson, Toronto: In a quintipara, aged 30, a large cauliflower carcinoma was found growing from the anterior lip of the vaginal portion of the cervix. The abdomen was opened, the uterus incised, and three 5-month fetuses removed, and then three separate placentas connected by membrane. A Wertheim operation was done. The patient made a good recovery.

The Graduate Degree in Obstetrics and Gynecology

Dr. Jennings C. Litzenberg, Minneapolis: The Minnesota plan for graduate work in the medical specialties is new, but new only in its application to medicine. The plan simply applies the principles governing university graduate work in any other branch of advanced learning to the medical branches, and places them not only under the same principles but actually in the graduate school of the university. The requirements for entry are a college degree, a medical degree, a thorough reading knowledge of French and German, and an internship of at least one year. The course extends over three years of work with a major and a minor, the same as for candidates for other advanced degrees, and examinations are held by a graduate faculty. A thesis, which must be an original contribution to science, is required and must be defended. This leads to the degree of Doctor of Philosophy in Obstetrics and Gynecology. A two years' course may lead to Master of Science. It is a plan to raise to a high level the training of specialists.

MEDICAL SOCIETY OF THE STATE OF NEW YORK

One Hundred and Twelfth Annual Meeting, held at Albany, May 21-23, 1918

The President, Dr. Alexander Lambert, in the Chair

Diagnosis of Nephritis

Dr. Albert A. Epstein, New York: A diagnosis of nephritis is confronted with two distinct problems: First, the determination of the pathologic processes involved, and, second, the evaluation of the kidney function. An accurate diagnosis of nephritis, therefore, entails a circumspect and complete analysis of all the morbid conditions present; the probable etiologic factors involved, the disturbance in function and other disorders which arise therefrom. To regard nephritis as an independent condition is a fallacy. The problem in the diagnosis of acute nephritis is essentially different from that of chronic nephritis. A consideration of the etiologic factors involved is very important; they are usually bacteria or their toxins, or, as I believe to be the case with certain subacute types, constitutional disorders of metabolic or endocrine origin. The existence of acute nephritis, excepting of course the chemical nephritides and the types occurring in pregnancy, point usually to an antecedent infection. But renal disorders with urinary signs frequently occur in febrile diseases of all kinds, which do not represent true nephritis, and thus the problem of differentiation often arises. In the latter group of cases the signs usually are not so pronounced. There is an albuminuria, at times, with casts. Functional disorders also arise. But there is not, as a rule, that marked evidence of renal involvement such as is found in the true cases of nephritis, nor does the disturbance last much beyond the duration of the febrile state. The difference is, perhaps, arbitrary and only one of degree. In the matter of chronic nephritis, the problem of etiology as a source of information is much more difficult. No doubt in a certain number of cases a history of acute nephritis or recurring infections may be elicited, and a diagnosis made; but the connection between the two is not always clear. Chronic poisoning, tuberculosis or syphilis may be contributory factors and require consideration in the diagnosis. There is one difficulty that presents itself from the clinical side in investigating the question of the connection between acute, subacute and chronic nephritis, and that is, that acute and subacute nephritis may appear without the development of symptoms other than the urinary signs during any infection. Furthermore, in the chronic nephropathies it is the possibility and the frequent occurrence of compensatory processes that create difficulty in arriving at a diagnosis. This is particularly true when the question is viewed from the functional standpoint. In the application of functional tests in the diagnosis of nephritis, two points should be borne in mind, namely, that a number of the different functional tests should be made and that they should be repeated in each and every case. As a prerequisite to the proper interpretation of the results obtained by functional tests, extrarenal factors that are capable of modifying or influencing them should be excluded.

Congenital Hydronephrosis

Dr. John T. Geraghty, Baltimore: There is a group of cases which has been puzzling practitioners for years. I refer principally to so-called primary hydronephrosis. The term "primary" has been used in these cases because there has been no etiologic factor that can be determined easily as the cause of this hydronephrosis. Many of the cases have been considered congenital, and until recently physicians have been of the opinion that most of the cases in which we can actually determine any cause for the extreme process are congenital. Recent studies, however, have shown that we are wrong. Two types of aberrant vessels are most apt to cause hydronephrosis. In one instance the vessels arise from the aorta behind the ureter and enter into the lower surface of the kidney at its lower pole. In the second case the vessel arises from the vena cava, crosses the anterior surface of the ureter, and enters the posterior surface of the kidney. These two conditions give rise to a condition that produces obstruction. In a series of fifteen cases, I was able to find aberrant vessels as the cause of hydronephrosis in only two. The vessel crossed at the ureteropelvic junction. Marked kinking of the ureter or pressure of a vessel crossing over the ureter is not sufficient to produce hydronephrosis. However, in some cases of unusual mobility in which the kidney drops down over the aberrant vessel, that vessel may play an important rôle. Even though aberrant vessels are found, it is well to bear in mind that may not be the primary cause. There may be other factors that play a causal rôle. Renal mobility is put forward as a common cause, and most urologists give it first place. In my experience it has been the most common cause of hydronephrosis.

In a series of fifteen cases, nephrectomy was performed in ten. In three cases plastic procedures were carried out, and in two cases aberrant vessels were divided. In a study of these ten cases, with one exception there was found at the ureteropelvic juncture, or in the upper part of the ureter, an inflammatory infiltrate. Most of these cases were considered congenital beforehand, but sections through the ureter in studying the pelvis showed varying amounts of infiltration.

The diagnosis of hydronephrosis is not difficult. It is possible to make a diagnosis of hydronephrosis by pyelography and to demonstrate the exact point where the hydronephrosis begins. In most cases the kidney is destroyed when the patient is first seen. At any rate, it is either badly infected or the kidney is destroyed. Nephrectomy is the proper treatment.

(To be continued)

11 So-Called Lucid Interval in Manic Depressive Psychoses. Its Medicolegal Value. A. Gordon, Philadelphia.—p. 667.

2. Examination of Regiment in Army for Nervous and Mental Diseases.—In all, 1,189 cases were examined. There were 647 cases, or 54.5 per cent., negative in every way; 542 cases, or 45.6 per cent., showed positive findings; 117 cases gave positive family histories of nervous and mental disorder, and in 40 of these cases all other findings were negative. There were 57 cases which gave positive personal histories of nervous and mental disorder, and in none of these cases were all other findings negative; 475 cases positive findings from the neurologic and mental examination and in 367 of these cases all other findings were negative. The 117 cases of positive family histories afforded the following data: Nervousness, 54, in which 37 were of the mother, 5 of the father, 6 of one brother or sister, 6 of two or more brothers and sisters. Fainting attacks, 10, in which 2 were of the mother, 2 of the father, 3 of one brother or sister, 2 of two or more brothers and sisters, 1 of grandparent. Epilepsy, 19, in which 3 were of the mother, 2 of the father, 10 of one brother or sister, 2 of two or more brothers and sisters, 2 of uncle or aunt. Goiter, 23, in which 8 were of the mother, 2 of the father, 13 of one brother and sister. Insanity, 5, in which 4 were of the mother, 1 of one uncle or aunt. Chorea, 3, in which 2 were of one brother or sister and 1 of one uncle or aunt. Miscellaneous, 3. The 57 cases of positive personal histories yielded the following: nervousness, 39; fainting attacks, 4; epilepsy, 8; chorea, 4; miscellaneous, 2.

The 475 cases with positive neurologic and mental findings ran as follows: 69 cases showed sufficient evidence of mental deviation to warrant further examination; 59 of these were classed as possible mental defectives, 15 of whom were negative in every other way; 10 were classed as possibly unstable emotionally. Only a few of the most important neurologic findings need be given: 71 cases showed the presence of several stigmata of degeneration; 112 cases showed pupillary changes; 93 cases showed thyroid changes; 108 cases showed knee-jerk changes; 126 cases showed the presence of tremors; 106 cases showed tremors of the fingers; 14 cases showed a slight stuttering or stammering; 35 cases showed combination of alteration of pupils and alterations of jerks and tremors. In the second examination, 144 cases were studied. The Wassermann test was done on 47 of these cases; the Binet test in 25; 27 were recommended for discharge. The diagnoses in these cases were as follows: defective mental development, 6; defective mental development and epilepsy, 3; defective mental development and constitutional inferiority, 3; defective mental development and constitutional inferiority with psychosis, 3; chorea, 3; exophthalmic goiter, 3, and exophthalmic goiter and defective mental development, 1.

7. Treatment of Paresis by Mercury.—Fourteen paretics, who had been showing symptoms from nine months to several years, received daily inunctions of mercurial ointment, 50 per cent. Every tenth day a lumbar puncture was made and from 20 c.c. to 40 c.c. of fluid withdrawn, the amount depending on the pressure and the rapidity of the flow. A Wassermann reaction was done, using the blood serum; a globulin test, cell count, Lange's colloidal gold test, Wassermann reaction and a chemical test to determine the presence of mercury were done, using the fluid. In seven, or 50 per cent., of the cases the blood Wassermann became negative and remained so for varying periods of time; one case had a negative blood at the time of admission and it remained so throughout the period of observation. In six, or 43 per cent., of the cases the spinal fluid became negative and remained so for varying periods of time. In no instance did the blood or spinal fluid become negative and remain so. All cases had negative globulin tests at one or more examinations; but, with the exception of one case, more positives than negatives were obtained. The cell count showed an irregular decrease in all instances. In four, or 28 per cent., of the cases the colloidal gold became negative, that is, was neither paretic nor syphilitic in type, but all showed "paretic curves" at some later examination. After fifteen months' treatment a trace of mercury was found in 500 c.c. of grouped spinal fluids. No mercury was found on previous examinations. One case showed a good remission mentally, but all the serologic findings remained strongly positive. Another case did not improve quite as much, but approached a state termed a remission, and has shown some negative serologic findings. The remaining twelve cases showed no greater mental or physical changes than would be found in a similar group of untreated cases. Finlayson emphasizes the fact that the lack of correlation between the serologic findings and mental conditions leaves little ground on which to base definite conclusions as to the value of the treatment.

18 *Normal Mechanism for Control of Oxidation in Body. W. E. Burge and A. J. Neill, Urbana, Ill.—p. 117.

12. **Regulation of Urea Excretion by Epinephrin.**—The authors found that the subcutaneous injection of epinephrin is followed by an increase in the urea excreting activity of the rabbit's kidney. There is a certain amount of epinephrin which produces the greatest increase in function. Smaller amounts have less and less effect until there is no change from the normal. With larger amounts the augmenting effect on secretion also becomes less until, with relatively large doses the reverse effect of a decrease in function is found. Except with these large amounts the rate of urea excretion is more rapid than in animals not given epinephrin in spite of a lowering of the blood urea concentration.

13. **Regulation of Urea Excretion by Pituitary Extract.**—The subcutaneous injection of pituitary extract was followed in all effective amounts by a decrease in the urea excreting activity of the rabbit's kidney. The rate of urea excretion is slower than in animals not given pituitary extract, although the blood urea concentration is higher.

15. **Muscular Strength and Muscular Symmetry in Man.**—Strength tests by means of a spring balance method were made by Martin on 240 children between the ages of 5 and 18 years. The average percentage distribution of the strength among the muscles of the body was determined for each age. These percentage distributions are proposed as standards of muscular symmetry in children.

16. **Effect of Epinephrin and Pituitary Extract on Action of Kidney Under Strain.**—At high blood urea concentrations the degree of change in the urea excreting activity of the kidney produced by epinephrin and by pituitary extract is less than at low blood urea concentrations.

18. **Mechanism for Control of Oxidation in Body.**—Burge and Neill state that ingestion of the foodstuffs increases the catalase of the blood and hence of the tissues parallel with the increase in heat production. The increase in catalase is due mainly to the stimulating effect of the absorbed foodstuffs on the liver. The ingestion of protein, in keeping with its greater stimulating effect on heat production, produces a greater increase in catalase than fat or carbohydrate. After the removal of the liver from the body of an animal, the liver cells continue to liberate catalase for about two hours, due presumably to the stimulating effect of the dextrose formed from the glycogen.

49. **Effect of Morphin and Ether on Blood Dextrose.**—A series of animals was subjected to the action of morphin injected subcutaneously and ether administered in an air mixture. These drugs were applied alone and together and in different orders. Blood dextrose determinations were made at various intervals. The data obtained lead Ross to the following conclusions: 1. Morphin administered hypodermically to dogs in doses of 10 mg. per kilogram of animal produced an average increase of 59 per cent. in the blood sugar in half an hour, 66 per cent. in 45 minutes, and 77 per cent. in an hour and a half. 2. Ether, given after morphin has been acting for half an hour, does not cause as much increase in blood sugar as if the morphin had not been used. However, the final degree of hyperglycemia is approximately the same, either with or without morphin.

58. **Stizolobin, Globulin of Chinese Velvet Bean.**—The globulin of the Chinese velvet bean has been isolated by Johns and Finks and analyzed. This protein has been named stizolobin. The basic amino acids in stizolobin have been determined by the method of Van Slyke. Analyses indicate that stizolobin contains all the basic amino acids known to exist in proteins. The lysin content is 8.27 per cent. of the protein. Tryptophane is also present. The free amino nitrogen in stizolobin has been found equal to very nearly one half of the lysin nitrogen as determined by the Van Slyke method.

60. **Glycosuria and Zinc Salts.**—The essential facts established by Salant and Wise are as follows: When zinc malate was injected intravenously into rabbits, glycosuria and hyperglycemia appeared, the presence of sugar in the urine as well as its increased amount in the blood being observed in well fed and in fasting animals; when sucrose was fed glycosuria was produced more easily. Glycosuria was also produced by subcutaneous injections and after the administration of zinc malate or acetate per os, but much larger doses were required. The amount of sugar in the urine was never large, being usually about 0.35 per cent., or less, in rabbits, but much larger averages were found in the urine of cats. Albuminuria, which in some cases became very pronounced, was likewise observed after administration of zinc salts, and it appeared either simultaneously with or before the glycosuria and lasted sometimes until the animal died. The duration of the glycosuria was about one to four days and also appeared irregularly in some experiments. Glycosuria, as well as albuminuria, was frequently absent in carrot-fed rabbits. When calcium chlorid was injected intravenously, immediately after or before zinc malate, glycosuria was slightly increased. The rate of secretion of urine was either diminished or remained unchanged after the administration of zinc salts. In a few cases only was the amount of urine augmented after the zinc. It appears, therefore, that some of the effects produced by zinc salts are analogous to those caused by the administration of other heavy metals.

65 *Fluctuations in Growth Energy of Malignant Tumors in Man, with Especial Reference to Spontaneous Recession. G. L. Rohdenburg, New York.—p. 193.

63. **Action of Radium on Hematopoietic System.**—The blood of ten cases of squamous cell carcinoma of the cervix uteri and vagina has been studied by Millet and Mueller in order to ascertain the immediate and remote effect of radium and roentgen-ray treatments on the formed elements of the blood. They found that the immediate effects of radium on the blood are not altered qualitatively by previous roentgen-ray or radium treatments, although the quantitative action may be somewhat diminished during a second treatment. The remote effects of radium on the blood are essentially similar to the effects of combined roentgen-ray and radium treatment. Individual slight differences in response to radium applications are often noted to occur again on a second application in the same individual. The immediate effects of radium on the blood are the following: (*a*) An immediate drop in total white count, reaching its maximum from one half to six hours after the application. (*b*) A return of the total white count to its former level within twenty-four hours after the application, usually within the first twelve hours. (*c*) An occasional secondary rise of the total white count to a point well above its original level from twelve hours to three days after the application. (*d*) A close adherence of the total polymorphonuclear count to the curve of the total white count. (*e*) An absence of characteristic changes in the total lymphocyte and total large mononuclear counts. (*f*) A tendency of the total lymphocyte count to follow in some degree the fluctuations of the total white count, especially when these are marked. This effect is not constant (*g*) A tendency of the relative lymphocyte count to drop, and of the polymorphonuclears to rise during the course of treatment. This tendency is reversed during the period immediately following the removal of the radium.

Remote effects of radium treatment on the blood are as follows: (*a*) Early. 1. Fall in lymphocyte count from two to four weeks after treatment, sometimes lasting till the end of the second month. 2. Fall in polymorphonuclears after treatment, sometimes simultaneous with the fall in lymphocytes but usually coming later and being less striking. 3. An attempt of the lymphocytes to recuperate, as shown by a rise in most cases at some later date, varying from three to nineteen weeks after treatment, to the approximate level seen before treatment. (*b*) Late. 1. Change in the relative counts as the patient's resistance weakens, with increase in polymorphonuclears and decrease of lymphocytes, but without leukocytosis. 2. Terminal leukocytosis, due in the main to increase of the absolute polymorphonuclear count, although usually accompanied by an absolute decrease in lymphocytes.

64. **Heat and Radium Action on Immunity Against Transplanted Animal Tumors.**—None of the results obtained by Rohdenburg and Bullock in their experimental work lead in any way to the conclusion that the improvement described in human cancer under radium treatment is due to the stimulation of autologous cells, or that benefit is to be expected by radiumization and previous or subsequent injection of homologous lymphoid tissue. Even though the tumors employed in the experiments had been cured, the results could not have been transferred to man, where the problem is to cure a spontaneous (as distinguished from a transplanted) neoplasm.

65. **Fluctuations in Growth Energy of Malignant Tumors.**—The literature of cancer is rich in reports of the recession of malignant tumors after one or another type of medical treatment, the particular therapeutic procedure which is supposed to have brought about the recession in each case being at once hailed as a "cure," only to give rise to failure and disappointment when tried out on a large group of cases. It is probable, therefore, that the isolated cases referred to are really spontaneous recessions and not therapeutic cures. With the idea of emphasizing the frequency of variations in the growth energy of human tumors, and at the same time of seeking further facts bearing on these variations in proliferative activity, the cases of marked recession or spontaneous cure recorded in the literature have been summarized by Rohdenburg, additional cases added, and the entire material subjected to analysis from the standpoint of his present knowledge of experimental cancer. It is concluded that recession of a malignant growth can occur in either sex, at any age period, with any type of malignant tumor, and irrespective of the location of the growth. It occurs after a variety of conditions, a proof that no particular one is specific, and it is very probable that all the conditions noted are preliminary, so to speak, and act by depressing the proliferative energy of the malignant cell until the defensive forces of the body (cytotoxins, cytolysins) are able to accomplish the final destruction. It appears that the most efficacious of all the many conditions which can bring about regressive change is heat, applied from without or occurring under the limited conditions of long duration and comparatively low degree. Including three personal observations recorded in this paper, Rohdenburg has been able to collect a total of 302 cases in which recession, either temporary or permanent, has occurred in a malignant growth. The chief lesson to be learned from the summary of cases here presented is that occasionally, perhaps with greater frequency than is ordinarily imagined, a malignant tumor will spontaneously recede. That such a regression does ever occur suggests that there may be found some method of bringing it about at will, even though this cannot be accomplished at the present time. Rohdenburg says that the occurrence of partial or complete spontaneous recession should make one very critical in judging new therapeutic procedures, that they may not be credited falsely with the results produced by forces of the nature of which we are for the present entirely ignorant.

98. **Cyst of Femur.**—Gannon's patient, a man, aged 65, was admitted to the hospital with extensive gangrene of right foot; arteriosclerosis and endarteritis as predisposing causes, and exposure to cold as the exciting cause. Examination showed besides the gangrene, an enlargement of the femur where, as he stated, there had been a fracture seven years ago. Gannon amputated the gangrenous limb by sawing through the enlargement of the thigh, and divided exactly in half, what proved to be the cyst. It contained about a half ounce of straw-colored fluid and a thick connective tissue membrane which was readily peeled from the surrounding bone. The membrane was removed from the proximal portion of the bone and the stump was sutured in the usual manner.

1. **Prophylactic Use of Quinin in Malaria.**—Between the beginning of February and the end of April, 1917, Treadgold examined the various units of a certain division in Macedonia with a view to determining the proportion of men on duty who were infected with malaria. Smears from 540 men were stained and searched for parasites. Plasmodia were found in over 30 per cent. of the men who had been in Macedonia during the previous summer, while the altered differential leukocyte count suggested that over 60 per cent. of such men were in reality infected. Parasites were found in nearly 8 per cent. of men with no history of fever; if the increased hyaline count is regarded as evidence of infection, their number increases to over 37 per cent. Gametes were found in over 90 per cent. of the positive slides, and schizonts were also present in a large proportion. *P. vivax* was the common parasite found: *P. falciparum* was noticed on seven occasions, *P. vivax* being also present in four out of the seven; *P. malariae* was only diagnosed once. As to the prophylactic use of quinin in malaria, Treadgold says, that speaking generally, it may be stated that quinin prophylaxis is [illegible]ally a bad investment for immigrants in the absence of protection against mosquito bites; taking one thing with another, the practice would in their case seem to be little more [illegible] a pious fraud, which has been perpetuated from one generation to the next simply because public opinion throughout the world has never been sufficiently enlightened to encourage the working out of the problem on scientific lines. Clinical and theoretical considerations compel us to admit that the general course of the disease may be noticeably affected by the previous taking of quinin, and that the sum of such influences is frequently unfavorable. So far as the allied armies in Macedonia are concerned, there is every reason to suppose that quinin taken daily over periods of many months has increased the severity and chronicity of the disease in a certain proportion of cases. Taking one thing with another, the available evidence indicates that in Macedonia, at any rate, the disadvantages of quinin prophylaxis outweigh the advantages.

11 *Malaria; Its Treatment and Complications. W. F. Wicht.—p. 288.
12 New Femoral Index. J. R. D. Holtby.—p. 294.

11. **Treatment of Malaria.**—Wicht's line of treatment of malaria is as follows: As soon as there is evidence of an attack of fever he starts the patient off on 10 grains acetyl salicylic acid along with a diaphoretic mixture. He places him between blankets, and at the same time starts the administration of quinin. For the first ten days quinin is administered at the rate of 40 grains per day. It is then reduced to 30 grains and liquor arsenicalis is given at the rate of 5 minims daily. This treatment is continued in the foregoing manner for another ten days, then the quinin is reduced to 20 grains, and the liquor arsenicalis to 7½ minims per diem. Then the quinin is further reduced to 10 grains after another ten days of this treatment, but the dosage of the liquor arsenicalis remains the same. Finally the quinin is discontinued altogether after the expiration of another ten days. Wicht's treatment for chronic malaria is as follows: Starting off with antipyretics and quinin, in a manner similar to the treatment of acute cases, he continues by putting the patient through a course of arsenical preparation for four consecutive days. If the patient still shows malarial parasites in his peripheral blood he puts him back and gives him a further course of arsenic for six consecutive days. He continues driving the quinin in doses similar to those quoted for the ordinary acute infection.

17 Teaching of Pathology. L. Smith.—p. 334.

16. **Pathology in General Practice.**—Edwards urges that: 1. Every graduate should have a thorough training in pathology, both theoretical and practical. This should be sufficient to allow him, should he find the opportunity, to carry out for himself not only routine laboratory work but also research. 2. Every general practitioner should have the right to laboratory report on any pathologic material, and this at no expense to himself or his patient. This should certainly include the right to the services of a competent pathologist to perform a postmortem examination in any case of interest. 3. Every provincial hospital should be provided with a fully equipped laboratory and a whole time pathologist. The only method of bringing pathology into active touch with the general practitioner is through the medium of the local hospital. All such local laboratories must be in intimate touch with the pathology department of some university, so that the more difficult examinations may be submitted for expert opinion.

27 *Dextrocardia. A. Clerc and J. Bobric.—p. 145.

27. **Dextrocardia.**—Clerc and Bobrie report a case in a robust soldier without associated lesions discoverable with the roentgen rays. His general depression and palpitations with slight tachycardia had developed *only* recently after a shell concussion, and his symptoms from the shell shock did not seem to differ from those in men with normal hearts. In 42 of the 56 known cases of dextrocardia the subjects were males. The anomaly was discovered in infancy in 6; and in the others at various ages up to 67. More than half were under 20. In 23 of 55 cases the anomaly was congenital beyond question and there were other malformations. In the 32 cases of pure, isolated dextrocardia there were no appreciable lesions or disturbances in the circulatory apparatus.

30 *Bilateral Crossed Herpes Zoster. J. Comby.—p. 253.
31 *Child Welfare Work in America. J. Comby.—p. 258.

28. **Echinococcus Disease in Children.**—Dévé insists that echinococcus disease in children is merely a simple cyst without complications. In examining a child, the possibility of echinococcus disease should be borne in mind and strict search made for it, as excision of the cyst eradicates the disease. This is Dévé's fifteenth published study on echinococcus disease. He has long emphasized the futility of the recommendations for prophylaxis by hygiene. Can we ever get children to refrain from playing with dogs, eating raw fruit or drinking water that is not boiled or filtered? It is impossible to protect human beings and animals against the invisible germs of the disease scattered by the dog infested with the echinococcus. But we can prevent the dog from acquiring these germs. This is the true solution of the problem of prophylaxis: protection of the dog. The dog becomes infested only by eating the viscera of animals slaughtered for meat, beef, pig and sheep, affected with what the butchers call "bubbles," *boules d'eau.* Especially in rural districts, the destruction by fire of all the viscera from an animal infested with the echinococcus, and the absolute exclusion of every dog from the places where animals are slaughtered, will eradicate the disease. Treatment of the single cyst in a child is a simple operation when preceded by injection of formaldehyd to kill the parasites and ward off postoperative recurrence. The prognosis is favorable unless the cyst is in the brain, lung or abdomen. In the lung the outcome is fatal more often than in adults, and multiple cysts in the abdomen usually require several interventions. In diagnosis, the persisting good general condition accompanying a tumor in the liver is characteristic. The specific antibodies in the blood may confirm the diagnosis, but in about 10 per cent. the findings are misleading. Eosinophilia is seldom characteristic in children, especially in those with helminths.

29. **Intermittent Fever with Meningococcus Septicemia.**—Netter reports a typical case in illustration of the fact that meningococcus infection may assume the type of a regular daily or tertian intermittent fever. It is often accompanied by eruptions, a nodular or polymorphous erythema or purpura, and one or two months or more may elapse before the cerebrospinal meningitis caps the clinical picture. In some cases the meningitis never develops at all. Bacteriologic examination of the blood clears up the diagnosis when the spinal fluid gives negative findings. The intermittent febrile attacks yield promptly to proper serotherapy, preferably polyvalent treatment. Intravenous injection may induce alarming reactions even at the first injection, so that the intraspinal route is preferable.

The case described in detail was in a boy of 15, and the febrile paroxysms occurred *irregularly,* morning or afternoon, every day or third day. In the intervals he did not seem sick. This was the rule also in the similar cases in infants and others on record. The chill, fever and enlargement of the spleen were sometimes accompanied by joint symptoms, but the eruptive manifestations pointed to meningococcus infection rather than to malaria in one of his five cases. In a case reported by Cantieri the diagnosis had been successively malaria, Addison's disease, tuberculosis, Malta fever, septicemia and febrile syphilis. No signs of meningitis were apparent until the eighty-first day. No meningococci were found in the spinal fluid until a day or two later. Serotherapy then promptly restored the patient to health, after months of futile other measures.

30. **Crossed Bilateral Herpes Zoster.**—Comby's two patients were a boy and girl over 7. The boy developed herpes zoster simultaneously in the left upper chest and back of the right thigh. The girl had symmetrical herpes on both buttocks. In forty-two cases of herpes zoster in children recorded in the last few years, there was no neuritic pain, no neuralgia followed, and recovery was soon complete. The cases in children confirm the assumption that the zona is the result of some local or general infection affecting some nerve or ganglion with transient or chronic congestion.

31. **Welfare Work for Children.**—Comby speaks appreciatively of what is being accomplished in the United States in the line of puericulture, and especially the work of the Children's Bureau of the American Red Cross. He says, "The Americans of the North, the United States of America, in taking their place beside us to fell the German monster, want to aid us not only in the present but even in the future. After having done the possible to ensure the victory of Right over Might, of Civilization over Barbarism, they have thought of tomorrow, and affirmed their intention of aiding in the rescue of future generations." He describes what has already been accomplished and is planned, and remarks in conclusion, "This splendid attitude of our friends from America merits more than gratitude on our part. It should rouse us to put forth all the energy of which our race has *shown itself* capable in the course of its history."

34. **Bone Plastic Operation on the Skull.**—Sicard and his co-workers have been using for two years a method of closing the breach in the skull with a plate of bone taken from the skull of a cadaver. They have had no mortality in their eighty-five cases while the outcome has been a reliable and durable success. Metal plates are liable to become a source of irritation, and cartilage and other bone grafts are liable to grow weak in time and even be absorbed, with return of pulsation in the area.

35. **Cancer of Esophagus.**—The ignored cancer in the man of 47 had never caused appreciable symptoms until it perforated into the trachea.

36. **Edema Without Nephritis.**—Labbé and Marcorelles report two cases of retention of salt, with anasarca, although the kidneys seemed to be normal. The diffuse and extreme edema in each case had developed during an attack of dysentery with anemia, and the edema subsided completely on a salt-free diet plus theobromin. The kidneys, heart and liver seemed to be entirely or approximately normal. The great loss of fluids from the dysentery seems to favor retention of chlorids and edema. The latter resembles in every respect the familiar edema with Bright's disease. The mechanism of its production is a mystery.

37. **Ligation of Nerve Cures Causalgia.**—Jacob and Hallez found all measures futile to relieve the intense pain in the domain of the right median nerve following a war wound entailing paralysis of the median and ulnar nerves. The causalgia persisted and there was not a trace of anything suggesting recovery of motor functioning by the end of the ninth month. Then Jan. 9, 1918, the median nerve was exposed for about 5 cm. well above the wound, and a ligature of No. 1 catgut was thrown around it. The nerve seemed large and much vascularized, with a slight edematous aspect. Within a few hours the pains were much reduced, and by the next day the causalgia had entirely subsided and there has been no recurrence during the months since although the motor paralysis and the reflexes were not modified. The hyperesthesia in the domain of the median nerve has changed to almost complete anesthesia, and the vasomotor and secretory disturbances in the region have almost entirely disappeared. The moderately tight catgut ligature inhibits or suppresses the irritability of the sympathetic fibers surrounding the nerve and the congestion in the trunk nerve, while the ligation does not injure the nerve fibers proper which are undergoing centrifugal regeneration. As the catgut is absorbed in a few days, the whole intervention is simpler and less of an operation than the other measures that have been applied in treatment of causalgia, including peripheral sympathectomy, injection of alcohol, or division of the nerve to which some have had recourse as the last resort.

38. **Paraplegia from Concussion of Spinal Cord.**—Summarized in Paris Letter, June 1, p. 1620.

43. **Acroparesthesia from Chilling.**—The sensory, vasomotor and trophic disturbances in the extremities under the influence of cold are important on account of the predisposition they entail to Raynaud's disease, to freezing of the feet, and to the so-called physiopathic contractures and paralyses after war wounds. There is evidently some constitutional or acquired vasoconstriction in hands or feet or in both, accompanied by analgesia of the four members and also sometimes of the nose and the ears. This analgesia embraces the limb except for the palm of the hand and the front part of the dorsum of the feet. When acquired, this syndrome can always be traced to some prolonged exposure to cold. Men known to have this acroparesthesia should be guarded against exposure to freezing, etc.

45 Acute Swelling of Half of Tongue. G. Schreiber.—p. 299.
46 Measurement of Pleural Effusion. A. Challamel.—p. 301.

44. **Stiff Joints from Shortness of Muscles.**—Thirteen years ago Nageotte-Wilbouchewitch called attention to the inability of certain children to flex their joints normally. She explained it as the result of abnormal shortness of the muscles involved, and time has unmistakably confirmed this assumption. A number of typical cases are illustrated here. There is nothing to suggest inflammation or contraction in the muscles; they are merely too short in proportion to the bone levers which they control. She has coined the term brachymyonia to express this condition. It may become apparent at the age of 6 or 7, but it is usually during the period of intense growth, from 11 to 15, that the play of the joints is most restricted. The children are awkward and the mothers complain that they seem to be petrifying. Boys are affected more often than girls, and there is usually a family history of nervousness, sluggish metabolism or chronic rheumatism. Some of the children had been prematurely born or were twins. A familial and hereditary occurrence is not rare but the children of the poor and the children of the well-to-do escape. She found it restricted to the middle class; perhaps it represents a kind of atavism, generations of sedentary occupations breeding this lack of proportion between the growth of the skeleton and the growth of the muscles.

The insufficiency of the movements and the chronic asphyxia when the "stiffness" affects the chest, keep the child in a vicious circle. Passive and active exercises and massage may improve the condition, but they have to be kept up during the entire period of growth and for some time afterward. Her experience indicates that when the bones have got their growth, the muscles keep on growing for a time, so that finally normal proportions are restored. This brachymyonia involving the chest, preventing the normal play of the lungs, seems to be the hardest to correct, while it is exceptionally hard to outgrow, and is fraught with exceptional peril for the child's health in general. All kinds of measures to restore the normal excusions of the thorax are indicated, with training in diaphragm breathing. Corsets and tight belts are exceptionally harmful for girls in this category. Improvement in mind and body parallels the improvement in the movements as the children lose their awkward stiffness and grow supple again.

51 Fluctuations in Spleen Early in Malaria. R. Porak.—p. 208.
52 Comparison of Bacteriologic and Chemical Analyses of Water. M. Brulé and R. Hazard.—p. 211.

47. **Gas Gangrene.**—Sacquépée reports that two anaerobes, the septic vibrio and the *Bacillus bellonensis* were found so constantly in 121 complete analyses in 100 cases of gas gangrene, that he is convinced that these are the specific agents of primary gas gangrene. The former seems to be responsible for the gas gangrene, the bellonensis for the gas gangrene and the edematous forms. They reproduce constantly the disease in animals, and exert the same toxic action.

50. **Acute Meningitis in Inherited Syphilis.**—Hutinel describes some cases in children between 3 and 15 in which the meningitis developed on a basis of inherited syphilis. It is like the meningitis in adults from acquired syphilis. In the first few weeks of life the specific meningitis is part of the grave general septicemic disease, but after the age of 2, there is not so much acute meningitis as the rearousing of old reactions on the part of the meninges to some casual infection acting on the already damaged nerve cells. The reaction may simulate tuberculous meningitis or it may be insidious and latent. Inherited syphilis should be suspected when the meningitis does not present the classical picture of ordinary meningitis and suspicious stigmata suggest possible syphilis, but the convincing proof is the recovery under specific treatment. Even when everything seems to suggest true tuberculous meningitis, he waits before informing the family until after a course of specific treatment. This does no harm in the tuberculous form while there is always a possibility that syphilis may be responsible for the meningitis, and that it may subside under treatment. The signs and symptoms of the *poussées méningitiques* in inherited syphilis are those of any acute meningitis; convulsions are frequent. The spinal fluid may show the findings common in tuberculous meningitis, or the lymphocytes may be replaced by medium or large mononuclears or polynuclears, and the cell count may vary rapidly. Spirochetes are not generally found in the fluid, and the Wassermann reaction is often negative. In about half his cases, a positive response to the Wassermann test in blood and spinal fluid was not obtained until after recovery.

The specific treatment evidently reactivated the substances yielding the Wassermann reaction.

56 Fractured *Humerus.* F. Rossi.—p. 83.
57 *Transitional Artificial Legs. V. Putti.—p. 91.

53. **Vitalization of Artificial Limbs.**—Vanghetti describes the history of his twenty years of efforts to have surgeons adopt the principle of direct muscular control of the movements of the artificial limb by the muscles in the stump. He is not a specialist surgeon himself, but he advocated the principle and had published seven articles on the subject between 1898 and 1908 and several since. He has devised fifty-one different ways in which the principle can be applied in various ways, including the utilizing of antagonist muscle action. He gives no mechanical details, leaving the working out of the principle to surgical specialists, as Sauerbruch in Germany (1916-1917) has already done although *forgetting* to mention the Italian source of the principle.

54. **Varices.**—Guaccero reviews the history of operative treatment of varicose veins in the leg, describing eight different technical procedures for the purpose, and sixteen operative cases from his own experience. He advocates operative treatment in all cases with extensive and progressive invasion, especially in the young. The most imperative indications are in the cases with a reflux from the heart on account of the insufficiency of the valves. The insufficiency of the valves of the internal saphenous vein, with ectasia, tortuous course and ampular dilatations, is shown up prominently by having the reclining patient stand up. The saphenous vein is then seen to fill up from above as well as from below, a centrifugal wave meeting the centripetal wave. The primary iliac and the external iliac have no valves, and when the saphenous vein is so enlarged that its valves become insufficient, then the result is a single long open tube into which the blood backs from above. The advancing wave from above can be checked by pressing the finger on the vein, but when the pressure is released, the vein at once grows turgid. In such cases the vein is liable to rupture, with profuse hemorrhage, and operative measures are urgently indicated. Removal of the entire vein is the most logical and certain treatment, removing the whole trouble at once. If this is not practicable, he advises excision of the most pronounced varices, and suture of the skin over other parts of the vein after cutting out a spindle-shape flap. Bringing the lips of the wound together exerts a pressure like that from an elastic stocking.

When the sign of the cardiac reflux is not apparent, then the cause of the varices is what he calls deep regurgitation. Muscles contracting over the deep system of veins compress the veins and force the blood in them out into the superficial veins. When this is the case, the varices develop at points where the intercommunicating veins are most numerous, namely, in the middle of the leg, in the middle third of the thigh, and in the triangle of Scarpa. Extensive removal of the vein is the best procedure here also, preferably of the entire vein. In the sixteen cases reported, total saphenectomy was done on the left leg in eight, the right in two and on both legs in three. In two, both the internal and external saphenous vein were removed. The results were invariably most gratifying, at the time and during the years since. In what is called varicose cyanosis, involving the capillaries, injections of some coagulating substance may be useful to supplement the removal of the vein.

55. **War Fractures of Long Bones.**—Francini discusses his two years of experience in a field hospital. In one case tetanus followed gas gangrene. On account of the gas gangrene, the thigh had been amputated. Antitetanus serum was given at the time and again a week later and the stump seemed to be healing perfectly when rapidly fatal tetanus appeared the fourteenth day, as also in another case, the twenty-first day. Amputation is imperative when gangrene from anemic necrosis becomes superposed on the bacterial, and at the earliest possible moment. Francini's extensive experience teaches that the whole of the muscle is infected throughout when one segment is unmistakably affected with gas gangrene. The stump, therefore, should be short unless the amputation can be done in the thigh, for instance, when the infection is in the leg. As the seat of the infectious process seems to be exclusively in the muscles, there is no advantage in a disarticulation rather than amputation. A high amputation with a lateral incision, as in the second step of a disarticulation, favors elimination of secretions and of necrotic tissue. He emphasizes that the gas impregnation of the tissues may extend higher than the actual infectious process. Hence we are not completely disarmed even if the characteristic sound (*scricchiolio*) *reaches above the root of the limb.* Of course the outlook is less favorable, but he has had successes even under these conditions, and so have others. Reamputation later is liable to rouse the sleeping or healing process anew, with disastrous consequences.

The circular method of amputation is his choice, and he swabs the stump freely with iodin. The soft parts can be stretched to cover the stump by means of two loops of adhesive plaster on each side fastened to a circular strip around the skin of the stump. A similar cage made of wire projects below the end of the stump. A piece of rubber tubing fastens the apex of the wire cage to the similar cage formed by the adhesive plaster strips. Gentle traction is thus exerted on the soft parts of the stump, and in a few days they are long enough to cover the stump completely. In his first series of twenty-nine amputations for gas gangrene *only 24 per cent.* of the men died, but in twenty-five recent cases so many hours had elapsed before it was possible to pick up the men, that all died but seven.

57. **The First and the Transitional Prostheses.**—Putti discusses the principles involved in preparing the stump for the definite prosthesis by the wearing of the pilon, and the importance of the proper fitting of the latter and of the transitional prosthesis.

Gazzetta degli Ospedali e delle Cliniche, Milan

April 4, 1918, **39**, No. 27

58 *Chronic Typhoid. F. Bergolli.—p. 267.

April 7, 1918, **39**, No. 28

59 *The Staphylococcus Albus. G. A. Pari.—p. 273.

58. **Chronic Typhoid.**—Bergolli reports three cases which warn that possibly typhoid with a tendency to chronicity may be mistaken for ordinary intestinal catarrh, febrile dyspepsia or masked tuberculosis, when examination of the blood or the agglutination test would reveal the typhoid origin of the disturbances. These disturbances may be of the nature of a series of complications, or anemia with much enlarged spleen, or a mild septicemia with gastro-intestinal manifestations. This latter group includes cases in which there seem to be series of reinfections, and also cases with series of relapses. In the first of his three cases the man had intervals of comparative health alternating with febrile bowel disturbances requiring hospital care. The paratyphoid B was cultivated from the blood each time, as also at the latest febrile period, ten months after the first symptoms. The temperature at this time ran up to 104 F. for one day and kept subfebrile for some time, with intense anemia but no delirium. The liver was hard and very large, and there was a tendency to urticaria. After subsidence of the fever this time the blood findings and tests were negative. There were no rose spots at any time. It is possible that paratyphoid is responsible for many cases of vague morbid conditions that drag along over months and are labeled catarrhal enteritis, febrile dyspepsia, etc. In another case the diarrhea, abdominal pains, headache and general weakness had lasted with ups and downs for a year. The paratyphoid B bacillus was found then in the blood, and the liver was very large and hard. A third patient had typhoid early in 1917 for sixty days. A month later he returned with fever and typhoid symptoms but the blood tests were negative. During the entire year he had to go to the hospital again and again on account of headache, diarrhea and abdominal pains, and finally the fever became continuous and the liver very much enlarged, but

there was no diarrhea. The fever gradually declined during the following three weeks, but then ran up very high, with a chill. After this it subsided to normal range by the thirteenth week. There had been no typhoid status during these weeks, and the blood findings were negative until the sixth week when typhoid bacilli, agglutinating at 1:400, were found. The importance of repeated bacteriologic examination of the blood in such cases is evident.

59. **The Staphylococcus Albus.**—Pari reports a number of typical cases which confirm the pathogenic properties of the *Staphylococcus albus.* He never was able to cultivate it from the blood of apparently healthy persons, but found it frequently in the blood of those presenting symptoms suggesting some coccus septicemia. In one boy of 13, polyarthritis dominated the clinical picture, in another a suppurative process in one hip joint yielded both the albus and aureus. In one man of 56 there was pericarditis and pleurisy in addition to polyarthritis and symptoms of sepsis, with final convalescence after nearly four months of illness with the albus cultivated from the blood. It was obtained also by puncture of the spleen in a boy of 16 with a mild form of albus sepsis. The fifth case is that of a woman of 31 with acute otitis media and mastoiditis, chills, fever, pleurisy, phlegmons and cystitis, developing shortly before delivery of a child that died an hour after birth. No microbes could be cultivated from the blood, but pure cultures of the albus were derived from the subcutaneous tissue of the arm at the point of the greatest infiltration.

60. **Epidemic Meningitis.**—Di Cristina and Sindoni relate that meningitis has been prevailing in eipdemic form at Palermo during the last five years. The mortality showed a downward trend until last year when there seemed to be an unusual predominance of extremely toxic cases and of relapses, flaring up of latent infection into the acute form, and protracted forms, the fever dragging along as if maintained by some suppurative process. Nothwithstanding free application of serotherapy, the mortality was over 54 per cent. in nurslings. The meningococci responsible for the tardy relapses and flare-ups seemed to be the same as at first, having regained their virulence after it had been for a time attenuated under the influence of the serotherapy. They had lost their agglutinating property, however, and had become resistant to the action of the antiserum. In fifty cases of the epidemic meningitis, sixteen developed these severe recurrences or relapses when the disease seemed to have been entirely conquered and the patients had apparently recovered or were convalescing. At first all those affected died. Serotherapy at this stage seemed to be futile and induced symptoms suggesting anaphylaxis even when this could not have been the case. They then began vaccine therapy, and when the intravenous route was adopted, the mortality dropped from 98 to 16.5 per cent. The charts from several cases in children given this vaccine therapy are reproduced. The fever declined and disappeared and both the general and local symptoms subsided and the spinal fluid cleared up.

61. **Functioning of the Mammary Gland.**—In this second study of this subject, Borrino sought to determine the reasons why bottle feeding, instead of breast feeding, had been given a certain proportion of the 1,110 children at the children's clinic at Turin and at the dispensary and consultations. As she found from her previous research, the women actually incapable of nursing their children are few and far between. Another point emphasized by her experience is that medical advice and assistance during the first week are able to increase materially the number of women able to nurse their children amply. Only in eighteen of 200 cases had the breast nursing been suspended later than the first month. In all the others the artificial feeding had been instituted during the first or second week. Consequently medical supervision and advice during the first two weeks may be said to ensure breast milk to the child. Milk stations, etc., to supply milk for infants are not needed so much as consultations, where the mothers are advised how to care for their infants. Distribution of milk has the wrong effect; it trains to artificial feeding of infants. In conclusion she reiterates that the first two weeks are the vital ones in this respect, and that prizes, lunches and other inducements should be offered to coax the mothers to bring their infants for consultations during these first weeks above all.

63. **Congenital Syphilis of the Kidney.**—Canelli has found congenital syphilis of the kidneys relatively frequent at necropsies. The manifestations of it are sclerotic atrophy, gummas, and cysts from retention. Amyloidosis of the kidneys is not characteristic of congenital syphilis. The nephritis from inherited syphilis may be an acute interstitial and parenchymatous form or a chronic sclerous atrophic. Familial syphilitic albuminuria may be a manifestation of tardy inherited syphilis.

65. **Vaccine Therapy in Malta Fever.**—Chiriaco reports three typical cases in children out of his extensive experience to sustain his statements as to the remarkable curative value of vaccine—made by the Di Cristina-Caronia technic—in treatment of undulant or Malta fever. He declares that no time should be wasted on quinin, dieting and intestinal disinfectants, but the vaccine should be given at once, as the patient grows worse under the other measures until irreparable damage results. He gives the vaccine by intramuscular injection, and relates that the results were always certain and extremely effectual, often actually remarkable from the rapid and complete disappearance of the infection.

66 *Familial Spasmophilia. M. Pincherle and A. Pollidori.—p. 169.

66. **Familial Spasmophilia.**—Pincherle and Pollidori have been making a special study of spasmophilia in different members of various families. They analyze what has been written on spasmophilia to date, especially on the familial factor, and review their experiences during the last ten years at the Bologna clinic for children's diseases. In ninety-one examples of typical spasmophilia, a familial factor was evident in twenty-five, that is, in nearly 25 per cent. It usually was manifested in the appearance of tetany in two or more members of the family. In some the spasmophilia was latent and required special tests to bring it into evidence. In some families alcoholism or grave constitutional disease or neuropathic stigmata were manifest in parents or brothers or sisters. Rachitis, status lymphaticus, adenoids or merely enlarged glands often accompanied the symptoms of spasmophilia. The boys outnumbered the girls in the children with spasmophilia. A familial occurrence is thus shown to be not the exception but the frequent rule. Instead of incriminating defective feeding and other extraneous factors, some constitutional abnormality is probably responsible. The causal factors are more than a mere casual accidental hemorrhage in the parathyroids which some have suggested as the cause. The whole thyroid and thymus system may be below par, or the endocrine system. This view is sustained by Fiore's case in which hypotrophy of the thymus occurred in a pronounced form in both parent and child.

August, 1917, **8**, No. 8

70 *Treatment of Amebic Dysentery. T. Bayma.—p. 173.
71 *Brain Tumor. H. Xavier.—p. 184.

68. **Treatment of Tuberculosis.**—Ferreira reviews a year's experiences with tuberculin treatment at the special tuberculosis clinic. He restricts the use of tuberculin to the first

stage of tuberculosis of the lungs, and to cases not showing a rapidly progressive or highly toxic course. He found it of benefit to give a complementary course with bovine tuberculin and then return to human tuberculin, or vice versa. Always he made a point of keeping the doses down to those inducing merely a minimal reaction, convinced that the tuberculin has no specific action but merely stimulates the organism to a more effectual defense. Hence it is futile to give it when the organism is not capable of devoting its energies to defense or is not free to do so. A lively reaction to the skin tuberculin test is a favorable sign. Tuberculins of different makes seemed to have always about the same action. One of the eight patients treated with induced pneumothorax died from complications and one has grown worse. The others are all either clinically cured or materially improved. The air at S. Paulo is very humid for heliotherapy. The patients did not even tan much under the exposures, showing that the ultraviolet rays scarcely reached the skin, but still five patients seemed to be materially benefited by the sun baths. Roentgen treatment gave good results in treatment of tuberculous glands. In twelve patients the tuberculin and Wassermann tests were both positive and there was one case which proved to be exclusively syphilis of the lung.

69. **The Value of Ambard's Constant.**—Aranha summarizes recent works on uremia in heart disease, in jaundice and with gastro-intestinal disease. All demonstrate the high value of the ureo-secretory constant both in diagnosis and prognosis.

70. **Amebic Dysentery**—Bayma remarks that he was the first to try epinephrin in treatment of amebic dysentery, publishing in July, 1915, his report on the systematic use of epinephrin in amebic dysentery. In later communications he endorsed its efficacy also in amebic liver disease and in appendicitis. In 1912 he found amebas in 0.11 per cent. of 3,419 stools examined at S. Paulo; in 1914 the proportion had risen to 2.04 per cent. of 3,418 stools, and in 1916 to 10 per cent. of 5,429 stools. Reports during the war from various countries indicate a wider prevalence of amebic dysentery in temperate climates than was formerly suspected. Epinephrin has certain advantages over emetin for treatment of amebic dysentery, and the experiences to date seem to indicate that the ameba is eradicated by it and does not pass into the encysted form. The epinephrin further has an important action on the suprarenalitis which has lately been demonstrated to be part of the clinical picture of amebic dysentery. Emetin and also the biniodid of bismuth and emetin have a more or less depressing action in amebic dysentery, directly aggravating the depression, weak pulse and tendency to syncope which reveal insufficiency on the part of the suprarenals. Epinephrin, on the other hand, suppresses the distressing colic and tenesmus, toning up the general system by its angiotonic and antitoxic action. The epinephrin can be given by the mouth up to 3 or 5 mg. a day without appreciably raising the blood pressure. Patients treated by Bayma with epinephrin over two years ago have remained in the best of health with nothing to indicate persisting infection with the ameba, and with nothing to suggest injury of the arteries or other organs from by-effects of the epinephrin. Only when the epinephrin is given by intravenous or intratracheal injection is there danger of by-effects. Bayma discusses further the experiences to date with oil of chenopodium, etc., and gives the bibliography of all these newer methods of treating amebic dysentery.

71. **Brain Tumor.**—Xavier reports a case of tumor in a man of 60 which had destroyed nearly all the white matter of the right hemisphere from the frontal pole to the occipital pole. The extent of the tumor explained the wide range of the symptoms. The sense of smell was lost but not vision. The absence of epilepsy spoke for a subcortical site. The ataxia had not been accompanied by vomiting or other cerebellar symptoms.

78 *Brazilian Trypanosomiasis and the Thyroid. E. Novaes.—p. 224.

75. **Trachoma in Cuba.**—Penichet's work was awarded the prize offered by the *Cronica* at the recent Cuban Medical Congress. He has found classic epidemic trachoma only in foreigners in Cuba, the natives having few cases and the disease so attenuated as to mask its nature. Trachoma formed only from 3.5 to 5.77 per cent. of the cases of eye disease treated in the clinics, and only 3.25 per cent. of Santos Fernandez' 36,242 eye patients between 1875 and 1903. In recent years the proportion of suspicious cases has risen to 10 per cent. but not all the cases with the clinical aspect of trachoma are the actual disease. The secretion may contain only the bacteria commonly found in inflamed eyes, and treatment may be promptly effectual. In one remote district Penichet found every one of the 1,000 children suffering from this false trachoma. He saw how the eye disease spread through the whole family when one member contracted a simple acute conjunctivitis, the total lack of hygiene favoring its transmission. By the time the first member of the affected family enters on convalescence he becomes infected anew from some of the other members of the family, and a vicious circle is started. One small vicious circle starts others and larger ones, so that it is a difficult matter to stamp out such an epidemic. These repeated inflammations finally entail more or less hardening, the conjunctiva reacting with hypertrophy, and it is very easy to mistake cases at this stage for trachoma. They respond as if by magic to operative treatment. In 10,000 cases of eye disease he has examined he found true trachoma only in less than 4 per cent., and he now is wary in diagnosing trachoma until he has had a chance to study the effects of treatment. Guiral and Soler have recently announced that the features of trachoma suggest a fungus origin, but the commission appointed to study this phase of the subject were unable to confirm their statements. No effects were obtained by Penichet with autogenous vaccines.

79 *Iodin in Surgery of the Eyes. R. Guiral.—p. 224.

79. **Iodin in Ophthalmology.**—Guiral comments on the absence of caustic action when tincture of iodin is applied to the eye. He has used it in 107 cataract operations without iridectomy and in seventy-four cases with iridectomy, and all were cured in three days. In four cases of hernia of the vitreous body all were cured in four days. He regards it as harmless for the eyeball; no signs of irritation are apparent when the eye is dressed the next day. Even the vitreous body does not seem to be injured by it, he says, while it wards off postoperative pain and promotes rapid healing.

81 *Elimination of Chlorids in Pneumonia. A. de F. Guião.—p. 9.
82 Heteradelphus Parasitic Monster. A. Silva, Jr.—p. 30.

80. **Roentgen Work in France.**—De Abreu is chief of the radiologic cabinet connected with the Franco-Brazilian ambulance stationed at Paris, and he descants on the revolution that has taken place in France since the war began in the general estimation of the roentgen rays. Before that, there were a few very eminent radiologists in France but the rank and file of the profession paid little attention to the roentgen rays, "and nothing," he remarks, "opposes such unconquerable resistance to the onward march of ideas as silence." The professional roentgenologists were misled by the Austrians into viewing radiology almost exclusively from the therapeutic standpoint.

The rays were experimented with in every disease and although the results were found excellent in some, this was restricted to certain parasitic skin diseases, tumors and certain forms of bone or skin tuberculosis, and leukemia. The rays were also used in diagnosis by a few French writers, especially the internists. But the majority of the physicians knew little and cared less about this method of examination, and even some of the first class medical services in the hospitals only rarely called for a roentgen examination of a patient, and then only for cancer of the stomach or kidney stones, and the chief of the service never followed the patient to the roentgen room. De Abreu had charge of the roentgen service in the largest hospital, and in his long months there only Chauffard, and he only once, followed the patient to the roentgen room. All apparently were content with the auscultation and percussion, the pathologic anatomy and bacteriology and chemistry findings.

But with the war and the necessity for locating projectiles in the tissues, radiology sprang at once into the first rank, and its importance for diagnosis in wide fields was soon recognized—a revelation for all. At the same time, roentgenology did not detract one iota from the value of clinical examination but enhanced its value. The war precipitated the use of the roentgen rays and de Abreu pleads for a similar diffusion in Brazil of knowledge concerning them and their wide and systematic utilization, without waiting for a war to force it on the country. He urges the creation of a chair for radiology in the University of Rio de Janeiro. Both in civilian and in military circles the young physicians of Brazil should get this training in roentgen work, and perhaps take a leading part in radiology, as some have done already in bacteriology.

81. **Elimination of Chlorids in Pneumonia.**—Guião devotes twenty pages to discussion of the literature on the retention of chlorids in pneumonia and the findings in ten cases personally investigated. He determined repeatedly the proportion of chlorids in the urine and in the sputum, with control research on some tuberculous and healthy controls. The chlorid content was higher in the sputum than in the urine during the febrile period, but after defervescence the reverse was observed. The difference between the total elimination of chlorids before and after defervescence is minimal. In the tuberculous, the chlorid content of sputum and urine kept approximately the same.

88 Social Insurance. Ubeda y Correal.—p. 208. Conclusion.

83. **Endemic Goiter in Spain.**—The previous instalments of Goyanes' article were reviewed on page 1570. He here gives illustrations of cretins and adults with goiter from the various villages in the Avila province. In one with 300 inhabitants he found four cretins. In one district with 1,780 inhabitants, in 1914 every one of the young men registered for military service was rejected on account of goiter.

85. **Retrovesical Echinococcus Cysts.**—Covisa's patient was a young man of 20, with no appreciable pathologic antecedents, who complained that micturition had been difficult for about four months. A smooth tumor could be felt reaching from the prostate region to the hypogastrium, with no signs of general or local inflammation. The complement deviation test for echinococcus disease was strongly positive, and the huge cyst was opened through a hypogastric incision and sutured to the lips of the wound. It apparently filled completely the space between the bladder and rectum and extended to the abdominal wall in the hypogastrium. In a second case with this same localization of a large echinococcus cyst between the bladder and the rectum, the latter had been compressed most and the disturbances had been mainly in defecation instead of in urination. This cyst was detached from below.

94 Present Status of Hemeralopia. K. K. K. Lundsgaard.—470. Commenced in No. 14, p. 429.

89. **Invagination from Tumor.**—In the case described, the woman of 51 recovered after resection of ileum and colon, the seat of invagination induced by a polypous fibroma in the cecum. She had had several attacks suggesting ileus, probably disturbances from invagination which had spontaneously corrected itself in time while the tumor was small. At first the attacks were merely periodical, vague digestive disturbances and abdominal pains. As they returned at long intervals they simulated various abdominal morbid conditions to actual ileus. Even if the invagination corrects itself, it is liable to recur, so that an operation when invagination is certain or even suspected is advocated.

90. **The Anamnesis with Eye Disease.**—Rønne remarks that when the practitioner is consulted on account of asthenopia, he can assume that the trouble is more likely to be from conjunctivitis if it has developed recently and acutely. Intolerance for tobacco smoke is perhaps the most constant symptom of conjunctivitis, as also of a stye. Recurring styes can be easily and certainly cured, he adds, with a persevering salve treatment, for example, with Ung. chloret. amido. hydrarg. With epiphora, the extent of the flow of tears can be estimated by asking whether a handkerchief has to be carried in the hand in the street to wipe the eye, and whether the flow continues in the house. Especially if the flow is only on one side, treatment is called for as dacryocystitis practically always develops in consequence of a chronic stricture or catarrhal process in the lacrimal duct.

With the sensation of a foreign body in the eye, the knowledge that the sensation comes and goes, testifies against there being an actual foreign body; with this the sensation would be continuous. Intermittent sensations of this kind are probably from some accumulation of conjunctivitic secretions. These foreign body pains are always located in or just beneath the conjunctiva, contrary to the pains from iritis. These are of a neuralgic type, mostly in the temple and forehead, and growing worse at night. Atropin is the best remedy here; it acts usually nearly instantaneously. Inflammatory glaucoma induces exactly the same type of pains, but atropin is absolutely contraindicated here. Glaucoma can be excluded not only by its objective symptoms but also by the rainbow halo around lights. The anamnesis is also highly instructive with bullous keratitis, developing after a scratch of the cornea and returning again and again after free intervals of days, months or years.

He warns against mistaking simple glaucoma for senile cataract as treatment of the former in time may arrest it. The beginning cataract is usually accompanied by monocular diplopia; women notice that in threading a needle they see two or several needles. An incipient cataract may induce some myopia; when the elderly suddenly lay aside their presbyopia glasses and read without them, this warns of beginning cataract. Simple glaucoma on the other hand, has scarcely any anamnestic symptoms, not even the rainbow halo, if treatment is not delayed until too late. The physician must be on the alert to detect hemianopsia and diplopia, even if the patient has not recognized himself the true nature of his visual disturbance.

91. **Hypertonic Saline in Treatment of Wounds and Ulcers.**—Permin found that the infected wound healed up remarkably quickly under hypertonic salt solution in the 120 cases in which he applied this treatment. The indications for it are when the wound cavity has infected, infiltrated walls. It is particularly useful under war conditions, in the office surgical work of the general practitioner, at first aid stations, and in the surgical policlinic. The method is easily applied, it is inexpensive and it is effectual, he declares.

93. **Meningococcus Infection.**—Sørensen discusses the Holmen epidemic in 1917 which has already been described in these columns, p. 498. The previous report on the subject was written too exclusively from the bacteriologic standpoint, he says, and he here emphasizes the three phases of the epidemic, first the widespread catarrhal disturbances, then a mild exanthematous sickness, and then a crop of meningitis cases with petechiae and 100 per cent. mortality. The cocci found corresponded in every particular to the typical meningococcus, except that it proliferated in bouillon-agar without waiting for admixture of ascitic fluid. Sørensen says that this extra vigorous proliferating power may explain the invasion of tissues other than those to which the meningococcus generally restricts its ravages, and hence its wide proliferation permitted an exceptional development of toxins, and acute fulminating toxic action. The clinical picture resembled that of varioloid purpura, and necropsy revealed infected spleen, pneumonia, purulent pericarditis and parenchymatous degeneration of organs. He is inclined to incriminate some other factor, as the men with this fulminating type all came from a certain compartment of the school ship. The assumption that the meningococcus in question was of a special and distinct type, or that there were two diseases present, one causing the exanthem and the other the meningitis, would explain the clinical course, and would also give greater hope of effectual treatment. The epidemic was arrested as soon as the quarters affected were temporarily abandoned.

95 *Abdominal Injury in the Newly Born. G. Hedren.—p. 1.
96 *Intracranial Hemorrhage in the Newborn. G. Hedren.—p. 53.
97 Center of Gravity of Erect Body. C. Hesser.—p. 133.

95. **Fatal Injury of Viscera in the Newly Born.**—Hedren discusses intrapartum injuries of the liver, pancreas, suprarenals and kidneys as he has encountered them or found reports in the literature. One most important practical conclusion from his study of the subject is that fatal injury of viscera may occur with spontaneous delivery. In his examination of 1,000 cadavers of new-born infants he found two with actual rupture of the parenchyma of the liver, one with spontaneous and one with forcible delivery. The mother in the latter case was a primipara of 42; the other mother was a tertipara of 22. In both cases there was breech presentation; the delivery occurred spontaneously in the younger woman but the child succumbed during delivery; the other child lived a day. In these as also in the comparatively numerous cases he has compiled from the literature, the liver was gorged with blood but otherwise normal. The child of another woman, a secundipara of 31, died six hours after spontaneous delivery in vertex presentation and necropsy revealed rupture of the spleen. In all the cases known of intrapartum rupture of the spleen, it was found already diseased. There is only one case each on record to his knowledge of fatal rupture of the pancreas or kidney, but minute subcapsular hemorrhages in the pancreas were found comparatively often in the 1,000 cadavers of the newly born. He gives summaries further of seventeen cases of fatal intrapartum injury of intestines, and one case of hematoma in the cecum and two of rupture of vessels in the omentum. In some of the cases conditions seemed to indicate that the rupture had occurred before delivery; in some during spontaneous delivery.

Among the 1,080 newly born infant cadavers, Hedren found a pronounced hematoma in one suprarenal gland in eight cases. In four the forceps completed the delivery, and in one case version and extraction were applied. In the four other cases delivery had been spontaneous, and a number of similar cases are on record. Every factor that increases the pressure in the veins, asphyxia, disturbance in breathing, promotes further the tendency to central hemorrhage in the suprarenals. There are some cases on record in which the swinging method of artificial respiration seems to have been responsible for the hemorrhages, although in some cases they had evidently preceded the swinging. This sequence of events is open to discussion in a case described by Hervey in which an infant died the tenth day after birth. Hemorrhages were found in the suprarenals and also in the skull, and the mother related that the child had fallen off the bed the day after its birth. Hervey ascribed all the hemorrhages to this, but the suprarenal damage may have occurred from birth trauma. Three pages of bibliography are appended.

96. **Intracranial Hemorrhage in the Newly Born.**—Hedren found intracranial hemorrhage in about 9.28 per cent. of 700 infant cadavers. The hemorrhage was restricted to the meninges in nearly 84 per cent., and cerebral hemorrhage accompanied the meningeal hemorrhage in others, bringing the total of meningeal hemorrhages to 90.7 per cent. The clinical and anatomic details of each case are given, with the bibliography on intracranial hemorrhage in the newly born. Delivery had been spontaneous in 50 of the 65 cases, and conditions in both mother and child seemed to be normal in most of the cases. In the 42 purely meningeal cases, the hemorrhage had been supratentorial in 32; infratentorial in 10, and both in 6. He ascribes great causal importance to intra-uterine disturbances in respiration and circulation, as well as to compression of the bones of the head in the birth passage. Only 3 of the children presented unmistakable evidence of inherited syphilis. In a few of the cases the mother had eclampsia. In 10 medicolegal cases, the intracranial hemorrhage was nearly always accompanied by signs of asphyxia, venous hyperemia, ecchymoses, etc. He emphasizes that injury from the birth trauma may resemble in every respect injury from certain external causes after birth. It is also important to bear in mind that these intracranial hemorrhages may occur with rapid and easy spontaneous delivery. He emphasizes also that the intracranial hemorrhage may occur during birth without fracture of bone, and hence that when a fracture or a fissure is found in the skull bones, this may have occurred after delivery. In conclusion he adds that on account of the medicolegal importance of intracranial hemorrhage, some standard procedure should be formulated and enforced for the taking out and the examination of the brain of the newly born in medicolegal cases. Hedren's two articles on hemorrhage in the newly born fil 132 pages, and each is accompanied by a full summary, in German.

98 *Habitual Constipation. VI. T. E. H. Thaysen.—p. 509. Com-
menced in No. 12, p. 467.
99 Puzzlinig Cases of Extra-Uterine Pregnancy. Henrichsen.—p. 52

98. **Dyspepsia with Habitual Constipation.**—*This is Thaysen's sixth report on the clinical and roentgen study o chronic habitual constipation.* The digestive disturbances fo which it is responsible seem to be distinguished by developing only after the chronic constipation is under way; by th fact that the pains, the cardialgia, are experienced at onc or soon after eating, and by the subsidence of the dyspepsi when the constipation is corrected. Cardialgia was noted i 73 per cent. of the women and in 35 per cent. of the me The female stomach seems to react with ptosis more tha the male stomach, while the stomach reacts with secretor disturbances more often in men than in women. Habitu constipation usually becomes installed between 15 and 2 or dates from childhood. Analysis of his cases indicates th the typical form of dyspepsia with habitual constipation ma be regarded as reflex disturbances set up by the constipate colon, colodyspepsia. In 150 cases of gastric ulcer, 109 ha a history of constipation but never so regular and stubbo as in the colon dyspepsia cases; men and women seem to equally affected. In a typical case of colon dyspeps described, the bowel functions were regulated, and regul functioning was maintained with massage of the abdome an abdominal band (*Neptuns Baelte*), cold sponging, and f in the diet after the dyspepsia had subsided. Six mont later the bowels were functioning spontaneously and t young woman has gained in weight and eats ordinary foo but no milk. There is still a tendency to cold hands and fe and occasionally headache.

The Journal of the American Medical Association

Published Under the Auspices of the Board of Trustees

Vol. 70, No. 26 CHICAGO, ILLINOIS JUNE 29, 1918

DUTIES OF THE DERMATOLOGIST *

H. H. HAZEN, M.D.

WASHINGTON, D. C.

Under ordinary circumstances it would be both easy and proper to point out many duties that confront the specialist in general and the dermatologist in particular; but in these times it seems necessary to mention only a few. Accordingly, five phases will be considered, namely, the duties of the special societies, certain duties to the patient that have not been sufficiently recognized, the need for developing more and better dermatologic clinics, the arsphenamin situation, and lastly the duties to the country.

THE WORK BEFORE DERMATOLOGISTS

For years many of us have felt that the various societies composed of specialists, as well as many of the special sections of the American Medical Association, have not fulfilled all that might be reasonably expected of them. They are rather pleasant social meetings with a sprinkling of good papers and some valuable discussion, both public and private, rather than beacons in the progress of science. Would it not be fair to ask that such societies should be the sources of authoritative information from which the general practitioner could gain help, from which the lay citizen could seek advice, or the government aid? A standing publication committee which should from time to time publish critiques or be prepared to answer proper queries would be valuable. Also it might be well to assign certain definite problems to members who are in a position to throw light on them: committee reports each year on certain important questions, such as radium treatment or the standardization of the Wassermann test might also be of extreme value. Of course the present is no time to act on such suggestions, but in the future it might be wise to consider certain of them.

DUTIES TO PATIENTS

In such a paper as this it is naturally impossible to discuss all that a specialist owes to his patients; nevertheless, one important thing must be emphasized, namely, the duty to recognize certain serious ailments that may be in the process of evolution. Those of us who have been interested in cancer propaganda have long maintained that the general practitioner, the internist and specialists in most lines have failed to note certain blemishes that might later develop into malignant conditions. Only too often does the specialist fail to realize that the condition which brings a patient under his observation may be but one symptom of some constitutional disease; the dermatologist may treat urticaria or a so-called acute eczema without knowing that the patient has a disturbance of the vegetative nervous system that is the direct cause of the local skin condition. Pruritis may be due to some disordered mental process. One noteworthy case of intractable eczema was directly due to a feeling of scrupulosity and hence excessive bathing, the primary mental condition being due to incest committed years earlier in life. Sweaty hands are frequently due to an oversecreting thyroid; sweating feet to weak arches; chronic urticaria to focal infections, syphilis or vagotonia, as well as to faulty digestion. If each and every one of us would more frequently refer his patient to a man who made a specialty of both physical and mental diagnosis, not only would more of our patients be relieved of cutaneous afflictions, but many a valuable man would be saved from later becoming a wreck.

POSTGRADUATE INSTRUCTION IN AMERICA

There can be no question that, in the past, certain cities in Germany and Austria have been the mecca for the training of American dermatologists. It is true that too often this has been a fad rather than a necessity; and, sad to relate, many a fledgling has learned to believe that all that is dermatologically good has and must come from Teutonic sources. Possibly if he had gone a bit deeper into his subjects he would have learned that frequently his professor or privatdocent was either too conceited or too ignorant to even know of the work that had been done in America, or that he wilfully chose to disregard it.

To some of us it has always been a marvel that more of us could not see through the folly of taking too seriously the work of a man who would dare to publish a bibliography of seventy-odd names, four French, one English, none American and the remainder German. However, it is extremely probable that the future dermatologist will not care to be trained in a city from which have emanated orders to use poisonous gases, to torpedo hospital ships and to bomb hospitals. In the United States we must prepare to train dermatologists and syphilologists, for the study of syphilis is coming into its own as the result of freer discussions necessitated by the war. We should now lay our plans to develop great clinics in which students and physicians can be thoroughly trained. Our dermatologic material has been too much scattered: in each city it should be more centralized for teaching purposes, so that the student can see a wealth of material. In addition, each dispensary should have its own laboratory attached, and there should be a number of hospital beds, both for severe dermatologic cases and for intraspinal work. Until we make up our minds to have fewer and better clinics we cannot hope to

---

* Chairman's address, read before the Section on Dermatology at the Sixty-Ninth Annual Session of the American Medical Association, Chicago, June, 1918.

give proper training, and it is distinctly up to the dermatologists to see to it that plans are now made.

THE ARSPHENAMIN SITUATION

There is no physician who does not remember how we Americans have been robbed as a result of the monopoly on arsphenamin (salvarsan). At present the situation is much better, thanks largely to the wisdom and foresight of one man, Jay Frank Schamberg of Philadelphia, a dermatologist. It is difficult to conceive of a treaty of peace that does not include the restoration of patent rights: when this time comes what must we pay for a drug that is many times more necessary than is diphtheria antitoxin? If we are thrown on the mercy of the German manufacturing house we need not expect prices that will enable the poor to be provided with it, and if by any chance the patent right should be assigned to the former distributors of the drug in this country, it is difficult to see how we should be any better off. As a proof of the latter point you are invited to read the testimony of Mr. Metz before Congress one year ago, when the abrogation of the patent rights on salvarsan was being discussed. Also, what guarantee should we have that a pure drug was being marketed? Certainly when a manufacturing house threatens to sue physicians for reporting unfavorable results, as the Farbwerke-Hoechst Company has done in the case of Dr. Sargent, we must believe that it is more interested in the financial than in the humanitarian side. As a public health proposition it is our duty to urge that salvarsan be specifically excluded when patent rights are being restored.

DERMATOLOGISTS IN ACTIVE SERVICE

Seven score and two years ago a great American patriot wrote, "These are the times that try men's souls." Once again do these words come home to every man of us, and each must ask himself, "What is my duty?" Many of our dermatologists have answered the question directly by entering one of the government services. Among these men are Pusey and Baum of Chicago, and Pollitzer, Fraser, Howard Fox, Fred Fox, C. M. Williams, Clark and Johnson of New York, the last of whom has recently died as the result of his devotion to duty. Still others are Wile of Ann Arbor, Dyer of New Orleans, Markley and Lingenfelter of Denver, Knowles and Gaskill of Philadelphia, Mook of St. Louis, Pudor of Portland, Sayles of Taunton, McBride and Dennie of Kansas City, Goldstein of Fort Smith, Chipman of San Francisco, and Oliver, Lee, Cheever and Howe of Boston, the last named having been killed in France. Also there are many others who have given freely of their time and strength in connection with the work of the draft boards or with local health problems. But for the rest of us, what is our duty? Certain men there are who cannot or should not offer their all. In this group may be placed those past 55 years of age, those who have some physical defect, those whose teaching or clinical positions cannot be filled, certain men in practice whose places cannot be filled, and some few who are in financial straits. Let us examine these criteria a little more closely.

Physicians over 55 are not considered eligible for the Medical Reserve Corps, and yet there are plenty of men past this age who are capable of doing hard work and who fill responsible positions at home. Many good men have been barred on physical examination because of some slight physical defect; some at least of these men could render valuable services in certain selected capacities. We all realize that under no circumstances can the Army be burdened with physicians who may break down under stress, and a rigid physical examination is an absolute necessity. A moment's thought will make all realize that physicians are a necessity to the community, and it would indeed be a short sighted policy that would permit our medical schools to be closed or which would deprive them of too many instructors. Furthermore, our clinics and hospitals must continue to render efficient service, for the continued good health of our population will be a great asset both during this war and in the more or less unsettled times that are sure to follow it. At the same time it is questionable if we do not have too many medical schools and far too many clinics. If certain of our schools could combine for the period of the war, many instructors could be spared; and if the weaker of our clinics and dispensaries should close their doors, only good would result. In practice there are a number of men whose services cannot well be spared. Many physicians in rural districts simply cannot be replaced at the present time. Men who are the only representatives of their specialty in a wide area may be vitally necessary, and some physicians to large industrial concerns would be more than sorely missed. There is now less financial excuse would gladly give part of their time for government has passed certain new legislation, but nevertheless it is hard for a physician who has borrowed money to educate himself, and who is now paying for a house and educating his children to accept a much smaller salary.

Many physicians in the classes enumerated above would gladly give part of their time for government work. It would seem perfectly possible for the Surgeon-General's Office to arrange that in the government hospitals, camps and cantonments there should be a visiting staff of civilian physicians, who should act in precisely the same capacity that many of them now act to the great civilian hospitals. They should, of course, be assigned certain definite hours and compelled to observe them. By such an arrangement as this several things could at once be accomplished: the physicians would not feel that they were remiss in their duty, troops would secure the very best medical attention, for specialists in various lines would be at their disposal, Army physicians would secure additional expert training, the medical schools could continue their work unhampered, the civil population would not suffer, and many Army physicians would be set free for more strictly military duties. At the same time we must all appreciate the tremendous difficulties that have been associated with the expansion of the medical corps and express a word of appreciation for the excellent work that has been done; this idea that has just been elaborated is not to be viewed in the light of a criticism but rather as a suggestion that many of us believe to be well worth considering.

A MOTTO FOR THE MEDICAL PROFESSION

Lastly, let us waste no time, but let us conserve our strength. Let us keep our tempers, let us not become hysterical, let us not be led into hasty judgments even though the medical mouthpiece of the Council of National Defense continues to utter fulsome fulminations. And in deciding what to do, let us be governed by one rule: Do what will be for the greatest good of the greatest number.

RELIABILITY OF OZONE IN SWIMMING POOL DISINFECTION *

WALLACE A. MANHEIMER, Ph.D.
Secretary, American Association for Promoting Hygiene and Public Baths
NEW YORK

It is now well established that the combination of refiltration and disinfection of swimming pool water constitutes the standard procedure in the sanitary control of plunge baths. It is also well known that the combined procedures of refiltration and disinfection effect reductions in the cost of maintenance which, in the long run, make the installation of expensive apparatus an actual economy. Furthermore, it is well to state that refiltration can be relied on in a properly designed system to maintain the pool water free from suspended matter, and that ozone treatment will supplement this by bleaching dissolved coloring matter and by destroying bacteria.

In diseases, bacteria are discharged from the body in pus, mucus, feces or blood. The bacteria are usually protected by these substances from the destroying activity of such natural agencies as light and drying; and probably the success obtained by the use of strong oxidizing chemicals, such as gaseous chlorin, the hypochlorites and ozone, may be attributed to the power these substances have of destroying the organic material enveloping the bacteria. Methods applied without regard to bacteria protected in this way usually fail in practical operation, even though excellent laboratory results are obtained when artificial cultures are used.

In swimming pools, in which there is always a greater load of organic matter than in the average water supply, it is of particular importance to select powerful oxidizing agents as disinfectants. Of these powerful agents we should consider the halogens and ozone.

THE HALOGENS.

In large water supplies, gaseous chlorin and the hypochlorites have in a great many cases been used with perfect success. In smaller systems they have occasionally failed, owing merely to the fact that objectionable tastes and odors were produced in the water when a sufficient quantity of chemical was used to insure sterilization. In swimming pools in which large quantities of organic matter are constantly introduced into the water, correspondingly large amounts of chemical must be added to insure thorough oxidation and adequate destruction of bacteria. For this reason it has been quite usual to find either one of two conditions obtaining in a pool in which chlorin or its compounds are used—namely, the addition of insufficient chemical, resulting in inadequate purification, or the addition of a superfluous amount with the production of tastes and odors making the water at times almost unfit for use. Consequently while from the bacterial point of view the halogens are quite efficient in pool water purification, they frequently fail in practice because they tend to reduce the patronage and therefore the usefulness of the pool.

OZONE.

The addition of a powerful oxidizing agent to pool water, in such an excess as to insure destruction of bacteria, though leaving no objectionable trace in the water, is particularly valuable in pool disinfection. Ozone is the only economically produced chemical of which we know that can be relied on to destroy the bacteria, bleach the coloring matter, successfully attack the organic substances, and at the same time leave no objectionable substance in the water. In fact, the process thoroughly aerates the water and enhances its appearance.

There is, of course, nothing novel in the successful application of ozone to the purification of large drinking water supplies. Spalding[1] states that forty-nine large ozone plants abroad regularly deliver pure water to large municipalities. In France he cites twenty-six plants, in Roumania four, in Spain one, in South America three, in Germany seven, in Italy five, and in Russia three. The plant at St. Maur supplies the city of Paris with 24,300,000 gallons daily, the Bon Voyage plant supplies Nice with 6,480,000 gallons daily, the plant at Villefranche supplies 7,020,000 gallons daily, and the plant at Petrograd supplies 14,040,000 gallons daily, to mention only some of the largest. It is evident, therefore, that the use of ozone in pool water purification is merely another instance of its successful application.

TESTS.

The summary of a series of tests has already been set forth,[2] from which I quote in part:

> The bacterial counts in this pool (Twenty-Third Street Bath) were so low after continuous operation of the ozone machine that it was deemed advisable to add a large number of *B. coli* to the water in order to observe the efficiency of ozone on heavily polluted water. Accordingly a mass culture of *B. coli* was emulsified in salt solution and thrown into the pool. In order to secure thorough mixing of the bacteria with the pool water and to keep the pollution high, the circulating pump was shut down between 10 a. m. and 2 p. m., a long handled brush was used to stir the water, and this, together with the agitation produced by the bathers, resulted in a uniform mix. The pool was then operated as usual and two hours later the tests were made.

ONE PART OF OZONE PER MILLION OF WATER

(Note.—All bacterial counts are averages of 3 or more determinations.)

Using ejector:
- Bacterial count in artificially infected pool, 3,700 per cubic centimeter.
- After filtration and before ozonation, 1,800 per cubic centimeter.
- After ozonation, no growth in 1 cubic centimeter.
- After ozonation, no growth in 3 cubic centimeter.

In addition to plating 1 c.c. of the water delivered from the ozone tower, 3 c.c. samples were plated as well. In the majority of cases no growths were obtained.

Using blower:
- Pool water in artificially infected pool, 3,500 per cubic centimeter.
- After filtration and before ozonation, 1,540 per cubic centimeter.
- After ozonation, no growth in 1 cubic centimeter.
- After ozonation, no growth in 3 cubic centimeters.

The results, using the blower, are identical with the foregoing. We conclude, therefore, that when one part per million of ozone is used, either with an ejector or with a centrifugal air blower (which delivers more air) the pool water artificially contaminated with *B. coli* is sterilized.

If one-half part ozone per million of water is used, the ejector, delivering less air than the blower, gives better results. Indeed, one-half part per million seems to be ample for average conditions.

A recent extensive series of tests was made to obtain data on which to judge the reliability of the process over an adequate period of time. These tests were made on alternate days three times a week for a period of three weeks without renewing the water. The results are set forth in the accompanying table, so as to show the uniformity obtaining:

* Two surface.

The attendance in this pool is exceptionally large, reaching at times 1,500 bathers a day. This necessarily causes high pollution. It will be observed that the water was delivered sterile, or nearly so, regardless of the counts before ozonation. In addition to this the water was bleached, gradually assuming a transparent blue, so that as the pool continued to be operated the appearance of the water was improved. Consequently where adequate refiltration is combined with ozone disinfection, the water may be retained in the pool for a considerable length of time, effecting a material reduction in the cost of maintenance. It should be stated, however, in designing a pool, that the capacity of the recirculation system should be proportional to the estimated attendance.

COST OF OPERATION.

The cost of operation for a 60,000-gallon pool is low. Only two items need be considered, the amount and cost of electric current, and the cost of the occasional replacement of calcium chlorid in the air dryer.

Alternating current must be supplied to the ozonator. If only a direct current is available, it must be converted into alternating current by means of a motor generator. This entails a current consumption of 2 kilowatts a day for a six-tube ozone unit (the unit to be used for a 60,000 gallon pool). The unit itself will consume only 2 kilowatts a day, so that if alternating current is available the cost of operation will be from 11 to 15 cents a day, allowing 1 cent for the replacement of calcium chlorid and figuring electric current at the rate of from 5 to 7 cents a kilowatt. If electrical current is manufactured on the premises the cost may be materially reduced below the figures stated. Where direct current must be converted into alternating current, from 10 to 14 cents (2 kilowatts) must be added to these figures.

It is obvious that the process is very economical in operation as well as reliable and automatic in control, and for these reasons is destined to wide application in the purification of swimming pools.

CONCLUSIONS.

Ozone is recommended for swimming pool purification because:

1. It is reliable as a disinfectant.
2. It is capable of purifying heavily polluted pool water.
3. It produces no objectionable substances in the water.
4. It improves the appearance and transparency of the water, permitting a longer continued use of the pool, a consequent reduction in the cost of maintenance, and a reduction in the hazard of drowning.
5. It is inexpensive in application.

2350 Davidson Avenue.

THE ACTION OF MIOTIC DRUGS ON EYES WITH INCOMPLETE SPHINCTER IRIDIS *

R. J. CURDY, M.D.
KANSAS CITY, MO.

In the literature of glaucoma and ocular injuries, there are contradictory opinions expressed on the effect of miotic drugs in cases of incomplete sphincter, especially in radial tears of the iris from contusions, leaving it a matter of conjecture whether such radial tears can be increased or diminished by the use of miotics. There is the same contradiction of opinion on the effect of mydriatics on radial tears. Regarding glaucoma, it seems generally to be assumed that the beneficial effects of the miotic drugs are due entirely to the contraction of the sphincter, and that these beneficial effects are abolished if the sphincter is not intact and functionally capable. On the other hand, it is frequently advised that treatment with miotics be given after iridectomy, in case of insufficient effect from the iridectomy, thus recognizing — or hoping — that the miotics may still be effective.

Elliott,[1] in objection to complete iridectomy in sclerocorneal trephining for glaucoma, says:

> It deprives the surgeon of the power of inducing strong miosis should he require to do so.

Johnson,[2] on the operative treatment of glaucoma, says:

> Suppose that the iridectomy has already been performed without permanently reducing the tension, what is one to do then? The ring of the inner circle of the iris has been divided and miotics will no longer act effectively.

Fuchs[3] says:

> *Eserin* . . . in many cases excites violent headache, which may lead to vomiting. These symptoms are not to be regarded as due to a general poisoning, but are caused by the marked contraction of the pupil, by which the nerves of the iris are strongly pulled upon. Hence, the symptoms are absent when marked contraction of the pupil fails to take place—e. g., in atrophy of the iris or in solutions of continuity of the sphincter (colobomata, fissures, etc.).

In the later edition, this paragraph is changed:

> *Eserin* frequently excites severe pain in the eyes and head, painful contractions in the lids, and even nausea and vomiting. These are not symptoms of poisoning, but are the results of the great narrowing of the pupil and the contraction of the ciliary muscle, by which the ciliary nerves are pulled upon. This bad by-effect, therefore, usually is absent when

---

[2] Johnson: Arch. Ophth., 1914, **43**, 8.

[3] Fuchs: Textbook of Ophthalmology, Third American Edition, 1908, p. 308; Fifth American Edition, 1917, p. 389.

for any cause, the eserin fails to produce any marked contraction of the pupil.

Beard,[4] writing of anterior sclerotomy with conjunctival bridge, says:

> A prolapse under the existing conditions could not be adequately dealt with, and an iridectomy would be undesirable in view of the possible need of miotics at a later period.

Again, on the efficiency of iridectomy:

> In the event of a relapse, it precludes the use of miotics.

Bradburne[5] says:

> This operation (basal buttonhole iridectomy), in that it leaves the pupillary border of the iris intact, allows the subsequent employment of miotics if such be deemed necessary.

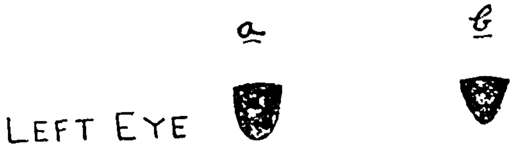

Fig. 1.—Size and shape of pupil (*a*) before and (*b*) after physostigmin.

Bernheimer,[6] reporting a case of congenital anomaly of the iris, observed six large round indentations of the pupillary margin, and within these three or four parallel folds of iris tissue which corresponded to smaller indentations. He says:

> The fact that the pupil reacted to light and contracted upon eserin, although not maximally, proved that the changes were only superficial disturbances of the arrangement of the tissue of the iris, and did not involve the sphincter.

Wuerdemann[7] argues both ways. Under "Injuries to the Uvea from Blows":

> If radial tears are seen, then atropin is contraindicated and eserin should be used to contract the pupil and draw the tears closer together.

Under "Lacerations of the Sphincter":

> We would theoretically imagine that miotics would bring the torn pupillary margins together and cause healing, but such never happens. Atropin, however, is contraindicated, as its action would only tend to deepen the tear.

Under "Mydriasis and Miosis Traumatica":

> If the pupil fully dilates to atropin, there has been no lesion of the dilator muscle; if contracting fully to eserin, none of the constrictor.

The accompanying illustrations show the actual size, by measurements, of pupils in three eyes before and after the use of eserin.

In the case illustrated in Figure 1, iridectomy had been done several years before for glaucoma, later extraction of the cataract was done, and still later sclerocorneal trephining, according to Elliott, all without arrest of glaucoma. In this case the tension-reducing effect of physostigmin (eserin) was demonstrated by the tonometer, which on one occasion measured the tension 39 mm. before, and 18 mm. after the use of physostigmin. That miotics can influence the tension even after iridectomy is probably generally recognized, and their use is usually advised after iridectomy.

In the case illustrated in Figure 2, iridectomy had been done on both eyes of a man, aged 20.

While measurements so small cannot be made with perfect accuracy, they show definitely a diminished size of the pupil and, especially significant, a narrowing of the coloboma. In both cases, and also in others, physostigmin has produced its other characteristic symptoms in addition to miosis — aching, spasmodic jerking pains, and spasm of accommodation in young persons. These symptoms, therefore, must be due to the action of the physostigmin on the ciliary body as much as to its action on the pupil. In this connection must be considered the question of the paralytic or relaxing effect of physostigmin on the dilator fibers of the iris, coincident with its spastic effect on the sphincter. In connection with the reduction of tension by physostigmin in an iridectomized eye is to be considered the mechanism of this change of tension, and the rôle in it of the ciliary body, since it evidently is not entirely due to the action of the sphincter. The conflicting opinions on the use of miotics and mydriatics in cases of injuries to the iris, especially radial tears involving the sphincter, are based mainly on theoretical considerations. It can be assumed that miotics, by diminishing the size of the pupil, can bring the margins of the tear together, and so promote healing, or that mydriatics, by relaxing the sphincter, can produce the same result. It can as reasonably be assumed that miotics, by exciting strong action of the sphincter, can pull the margins of the tear apart and so prevent healing, or even increase the tear; or that the same result can be brought about by the dilatation of the pupil produced by mydriatics. As a matter of clinical fact, however, it is probable that mydriatics and miotics have no power to increase or diminish the extent of the iris tears. Hence, the use of mydriatics or miotics is to be determined by other considerations. Usually mydriatics are indicated because of iritis, and any permanent mydriasis resulting is to be regarded as due to the injury, and not to the use of mydriatic treatment.

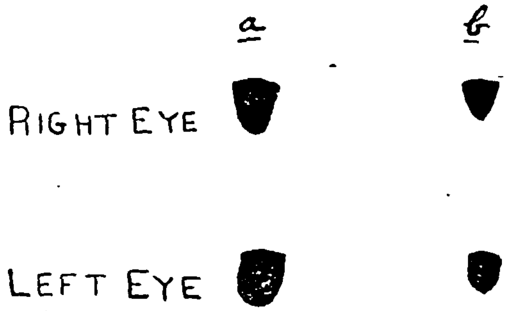

Fig. 2.—Size and shape of pupils (*a*) before and (*b*) after physostigmin.

CONCLUSIONS

Physostigmin can produce contraction of the pupil, narrowing of the coloboma, and reduction of the glaucomatous tension in iridectomized eyes.

The contraction of the pupil and coloboma indicates that there is a relaxing effect on the radial fibers of the iris, as well as the spastic effect on the sphincter.

The action of the ciliary body is a factor in the reduction of the glaucomatous tension produced by physostigmin.

It is probable that miotics (and mydriatics) have no power to increase or diminish the extent of radial tears of the iris.

ABSTRACT OF DISCUSSION

Col. Frank C. Todd, Minneapolis: Dr. Curdy especially relates this subject to the treatment of glaucoma, and calls attention to the fact that even where the sphincter has been cut, some contraction of the pupil takes place. It is well known that miotics, such as eserin, produce the maximum contraction of the pupil, and a maximum contraction of the pupil could not be produced unless two things take place, namely, a paralysis of the fibers that dilate the pupil, and a stimulation of the fibers—that is, of the sphincter—that contract the pupil. So it has this combined action. That is further confirmed by the fact that in the case of paralysis of the sphincter, the use of eserin will produce medium but not maximum contraction of the pupil, because it relaxes the dilator fibers. Then why should we not expect the same effect if the sphincter fibers are cut, when we have a coloboma? that is, a relaxation of the dilator fibers may take place.

This brings us to the practical point of the wisdom of producing a complete coloboma in the operation of trephining for glaucoma. I have thought that I have made some failures to permanently reduce tension where I have made too small an opening in the iris. Perhaps you remember that Elliot considered that iridectomy was of no value in his glaucoma operations, and when the iris did not present he was not in the habit of cutting the iris out. My experience has been that in some of those cases in which a sufficient amount of iris was not removed, the plugging of the hole might take place more readily afterward, and I have preferred to have a large coloboma than to have a very small one. But I do think that ideally the wide coloboma, produced with the Elliot operation, with the retention of the pupil, is more advantageous, if only for the fact that we can get more of a contraction of the pupil later by the use of a miotic, if that seems necessary. That is to say, if we can get a coloboma like this (illustrating by means of the blackboard), leaving intact the marginal fibers, we then have an opportunity to produce a maximum contraction of the pupil, if it seems wise, for after treatment to further reduce the tension.

Dr. Robert J. Curdy, Kansas City, Mo.: It is true, as Dr. Todd says, the maximum contraction of the pupil cannot be produced if the sphincter is interrupted, but in the treatment of glaucoma with miotics, we are not trying to produce contraction of the pupil; we are trying to cure the glaucoma, and it is the purpose of this paper to show that miotics can be effective in the treatment of glaucoma notwithstanding the interruption of the sphincter of the iris.

Infant Mortality in the Philippines.—Sixto Y. Orosa, M.D., in an article in the November number of *Revista Filipina de Medicina y Farmacia* gives the results of his study of 334 families in Jolo, with a population of 8,287, with reference to infant care and mortality. He shows that the average family has three children, one of whom dies. With reference to feeding, out of 1,117, 924 were breast fed, 109 bottle fed and 84 given mixed feeding. Of the 924 children breast fed 632 lived, 68 per cent.; 292 died, 30 per cent. Of 109 bottle fed, 86 lived, or 78 per cent., and 23 died, or about 21 per cent. Of the 84 given mixed feed, 50 lived, or nearly 60 per cent., and 34 died, or 34 per cent. Thus, he says, notwithstanding the ignorance of the average mother, the percentage of deaths of those artificially fed was 21 or 22 per cent. as against 30 per cent. for the breast fed. The bottle fed also had less deaths than those given mixed feeding. Condensed milk is generally employed in artificial feeding. Out of 349 deaths, 165 occurred before the age of 1 month, or nearly 50 per cent.; 286 occurred before the child reached 5, or 82 per cent., and 336 deaths occurred before the child reached 15 years, or over 97 per cent. Infantile convulsions is among the chief and first causes of death of infants, and their mothers usually show signs of beriberi. The infant becomes blue and is seized with convulsions. The condition is called "alperesia." Intestinal diseases, malaria and respiratory diseases follow in order of importance as causes of death, and syphilis and malaria are important causes of abortion, of which there are many cases.

THE RELATION OF HEREDITARY EYE DEFECTS TO GENETICS AND EUGENICS *

LUCIEN HOWE, M.D.
BUFFALO

Of late years, while trying to learn something about ocular muscles, I have been confronted often by questions concerning heredity. I have found, as others doubtless have, three, four or even more persons in the same family with a similar form of heterophoria, heterotropia, predisposition to ocular fatigue, or similar abnormal muscular conditions. It seemed impossible to study these anomalies satisfactorily without first halting to learn something about that mystery which we call heredity.

It is understood that "genetics" is a general term including everything that pertains to generation. Heredity is more specific, dealing with "the organic relationship between generations." As defined by Davenport, "it is the phenomenon of the recurrence of traits in blood relatives due to the persistence of their determiners in the germ plasm." Eugenics refers, of course, to the improvement of a race by selected breeding.

It is not possible here to give any systematic account of the studies already made of hereditary eye defects, except to mention the classic work by Groenouw,[1] the interesting histories collected by Nettleship, the more recent bibliography by Loeb, with the exhaustive articles by him, or those by Libby and others. The point is that we ophthalmologists have been content thus far with reporting family histories without attempting to relate those histories to other facts, now well established by geneticists.

Meanwhile, the science of modern genetics has come into being and has developed rapidly, especially in its relation to defects of the eyes.

Davenport[2] includes the following conditions: degeneracy of the cornea, anomalies of iris, glaucoma, displaced lens, cataract, pigmentary degeneration of the retina, atrophy of the optic nerve, night blindness, color blindness, reduction in size of the eyeball, megalophthalmus, myopia, astigmatism, paralysis or imperfect development of the muscles of eye and lids and nystagmus.

In view of the vastness of the subject and the brevity necessary in our transactions, my objects here are to:

1. Formulate a plan by which we may relate our clinical facts to the data of genetics and eugenics.
2. Show how each ophthalmologist can contribute something to our common fund of knowledge concerning it.
3. Give the results of my own studies thus far in the form of exhibits with the presentation of the paper, and publish those results later, separately. That saves time at the meeting, and space in our transactions, but still gives credit, if any there be, to our section for priority in the work shown by the exhibits.
4. Suggest a plan which may prove practicable for preventing to some extent hereditary blindness.

---

* Read before the Section on Ophthalmology at the Sixty-Ninth Annual Session of the American Medical Association, Chicago, June, 1918.

[1] Groenouw, in Handbuch der gesamten Augenheilkunde, Graefe-Saemisch, Ed. 2, Part 1, **11**, 415.

[2] Davenport, C. B.: Heredity in Relation to Eugenics, New York, Henry Holt & Co., 1911.

The plan to attain these four objects is to:

1. Bring the bibliography to date.
2. Arrange it according to diagnoses.
3. Add new family histories of such eye defects.
4. Chart certain histories reported previously only in narrative form.
5. Compare the relation of such defects with the mendelian or other principles of heredity.
6. Show the importance of a differential diagnosis between defects really hereditary and those due to infection (syphilis).
7. Suggest a plan for the prevention of hereditary blindness by sequestration, or by sterilization if the transmitter of the blindness so elects.

The reassuring statement should be made at once that it is not intended to cover all of this ground in this paper. For example, the first and second steps in the proposed plan are represented by what may be called Exhibit A. This is a bibliography in the form of a card catalogue. The literature up to 1901 was collected and arranged, according to diagnoses, by Groenouw. That list contained 324 references. Loeb published his bibliography in 1909, but as his list partly duplicated that of Groenouw, and was arranged alphabetically — not according to diagnosis — and as an assistant has found over 200 other real or supposed family histories of heredity, it seemed best to make a new list from 1901 and rearrange all according to diagnosis. That constitutes the present list of over 700 titles brought practically to date and arranged on a unified plan.

Schematic outline of Mendel's law.

The third step is represented by Exhibit B. This is a group of twenty-four charts of new family histories of hereditary eye defects. These were obtained by examining the files at the Eugenics Record Office of the Carnegie Institution of Washington at Cold Spring Harbor, N. Y., and acknowledgment is here due to the director, Dr. Davenport, for the unusual opportunity thus afforded.

The fourth step is represented by Exhibit C. This is a collection of over thirty charts of hereditary eye defects. These histories were published in narrative form, and as such were difficult or almost useless for study or comparison. A few charts already published were also added to show good examples of a defect which is really hereditary and one which is not, and also to show when a defect is "dominant" or "recessive." The importance of this differentiation will appear later.

It is possible now only to mention these three exhibits. They will be explained in detail when published.

We come then to our fifth step. To state this in slightly technical terms, we ask, does a certain chart suggest in any degree the mendelian law of descent? If so, is the defect dominant or is it recessive? Or does the chart show an example of sex linkage, or are other principles of heredity involved? These are new terms to many of us, but in this paper we have to take for granted a knowledge of the wonderful law discovered by that extraordinary character, the monk, Gregor Johann Mendel, and also what that law means to students of genetics of today.

THE MENDELIAN LAW

An example of mendelian descent, as demonstrated in the eyes of fowls, will recall the more important points: If one fowl having a dark red iris is mated with another that has a gray or pearl colored iris, the descendants in the first generation, called technically the first filial generation, and usually indicated F_1, will show red irises slightly mottled with pearl. That is, it happens that the red iris in poultry "dominates" almost entirely over pearl. But if members of this F_1 be bred with each other, then in the second filial generation, or F_2, we find, on counting the offspring, that about one fourth have their irises red, one fourth of them pearl, and half have mottled eyes. If the red "domination" were complete, then the proportion would be three red eyed to one pearl; but breeding tests would show that, on the average, two thirds of those with red eyes were hybrids. If now, we inbreed these F_2 individuals, we find when a red-eyed fowl is bred with a corresponding red-eyed fowl, the progeny are all red eyed, for any number of generations. Also, when the pearl-eyed fowl is bred with a pearl-eyed fowl, the progeny are all pearl eyed for any number of generations. But when two of the intermediate type in F_2 are inbred, the eyes of their progeny in F_3 are not all red, but their progeny in F_3 break up into one red, two mottled and one pearl, as in F_2. When these groups in F_3 are again inbred, we find in the succeeding generation F_4 the same behavior.

The mendelian law is usually stated briefly by letters. Thus, if we denote the dominant parent having the red iris by D, and the recessive parent having the pearl iris by R, the offspring in F_1 is indicated by D (R), the R being in parenthesis to show that it is recessive to D. The hybrid D (R) when inbred gives offspring in F_2 in the ratio, DD + D (R) + D (R) + RR. The first DD breeds true. The RR also breeds true. But each of the two intermediate D (R)'s produce in F_3 a corresponding series of DD + D (R) + D (R) + RR.

The mendelian law is also illustrated by a diagrammatic arrangement of the letters which indicate the groups of four. As none of the published diagrams seemed to make the sequence entirely clear to me at first, I have outlined the details of Mendel's law as shown in the accompanying diagram. It may also prove of assistance to other students, even if it be rather schematic.

OTHER PRINCIPLES OF HEREDITY

Sex linkage is another principle of heredity to which attention may be called. This is the tendency which certain characteristics have to develop exclusively or predominantly in the male members of the family, especially in certain crosses. For our purpose, however, it must suffice to recall the fact that among the diseases appearing predominantly or exclusively in the male line, at least in certain families, are atrophy of the optic nerve, color blindness, night blindness and probably other defects.

It is impossible in a brief statement like this to give even passing notice to other principles of heredity which are of undoubted importance in a study of eye defects. Among these may be mentioned blended and excessive inheritance, reversion, predisposition to disease, immunity, etc. But it is doubtless the case that even our present knowledge of these principles will assist us in understanding why in certain families this or that defect of the eye does appear to be dominant, and on the other hand, why in certain other families the same defect appears to be more distinctly recessive. Thus by charting the knowledge which we have thus far acquired of eye defects and comparing those charts with a knowledge of the principles of heredity, it is probable that the relation between the two will become more apparent.

APPROACH TO THE STUDY BY THE OPHTHALMOLOGIST

One of my main objects, as already stated, is to interest others, if possible, in this subject, so that they may help to solve questions that can only be hinted at here. Therefore, it is in order to indicate briefly how the study can be approached by any ophthalmologist.

As to a theoretical knowledge of heredity, it may be of assistance to mention a few books which have been found useful. Herbert's "First Principles of Heredity" gives an outline of the entire subject. Castle's "Genetics and Eugenics" is more elaborate and technical. Davenport's "Heredity in Relation to Eugenics" is especially interesting and gives a number of data relating to hereditary defects of the eye.

A short, systematic course of reading like this gives a theoretical idea of the principles of heredity sufficiently definite to enable the ophthalmologist to discern some of the relations between a given principle or line of descent and a given group of eye defects.

Theoretical knowledge is, however, second hand mental furniture. The best way to learn these principles and one vastly more interesting is to supplement the reading with at least a few experiments.

The breeding of eye defects is easier than most persons imagine. Chickens and pigeons are the best subjects for such experiments.

By advertising in the *Reliable Poultry Journal* and other trade papers, it has been possible to obtain for the parent stock more than a dozen specimens of eye defects. These included corneal irregularities, and variations in the color of the iris and in the position of the eyes and of the pupil. The different pens of chickens at a small place, known as Mendel Farm, on the lake shore near Buffalo, have proved to me a source of much interest and enlightenment.

The breeding of dogs has not been found satisfactory. Eye defects are rare, the generations slow and the litters small. For similar reasons, cats are undesirable. It is probable, however, that interesting results could be obtained by breeding white cats which have blue eyes—such cats being often deaf. This fact had been already observed by Darwin and has been the subject of breeding experiments by Dr. Graham Bell.[3]

The eyes of the small fruit fly, *Drosophila ampelophila*, have proved most interesting. I am indebted to Professor Morgan of Columbia for parent stock, the blind variety of which I bred through more than twelve generations.

PRACTICAL VALUE OF THE STUDY

The average reader of this paper may say that such a glance at the principles of heredity may be curious and possibly interesting, but of what practical use is it?

Of course, we never find a typical mendelian ratio in the human species, because brothers and sisters never marry. But an approach to these ratios we do find constantly, and that law furnishes an important guide, not only in recognizing heredity itself in a given family history, as distinguished from an infection, but in also indicating when the defect is dominant or recessive. In other words, this relation between genetics and ophthalmology throws light on the differential diagnosis (the next step in our study), and is very decidedly practical in connection with eugenics.

With this reassurance as to the reason for continuing, let us pass to the examination of family histories to determine whether a given defect is in reality hereditary, or whether it is due to infection from syphilis or other causes.

It would necessitate a rather long digression to show just how this differential diagnosis is made. Suffice it to say that our criterion is the technical definition of heredity given at the outset. The fact is that a very considerable proportion of defects which we all supposed formerly were hereditary are probably not hereditary, but the effect of some infection more or less obscure. An excellent example of this is a family history of aniridia reported by one of the oldest and best known members[4] of this section. The author and all other ophthalmologists accepted this as an undoubted example of heredity, but competent geneticists now demonstrate that to be highly improbable.

Other diseases besides syphilis, or susceptibility to them, undoubtedly are transmitted from parent to offspring, and with these diseases we should include the effects of alcohol. In a word, caution is necessary in our diagnosis. We find, too, that even many of the muscular anomalies which seemed to be hereditary, and which prompted this whole study, are not hereditary after all.

Having thus collected various family histories, even those said to be hereditary, classified them, added to their number, charted them, studied the relation of genetics to these histories, and having seen the necessity of more exact diagnosis, we can now leave this imperfect sketch of the relation of eye defects to genetics, and pass to the eugenic aspect of the subject. The literature concerning this is scanty and confused. It will tend to clearer thinking to define a few terms. From the standpoint of eugenics, eye defects may be divided into two groups — the minor defects, or deformities, and major defects, or blindness.

The term "hereditary" we should also define more exactly as including two groups—one in which the recurrence of the defect is only "possible," especially when that defect is "recessive," the other in which its recurrence is "probable," especially when that defect is "dominant." Evidently, therefore, we have as many conditions to deal with as there are combinations, in pairs, of these four factors.

Still another factor enters into the problem—the personal equation of the parties to a marriage contract. For when two persons contemplate matrimony, it can usually be taken for granted that their judgment has, for the time, taken wings. Professor McCready, in his lectures at the College of Physicians and Surgeons, used to say his case records showed that for various reasons he had advised one or both parties against marriage some sixty-eight times; and his records also showed that sixty-eight times the couples went almost straight to the altar.

---

[4] Risley, S. D.: Hereditary Aniridia, The Journal A. M. A., April 17, 1915, p. 1310.

But temporary obsessions by those who ask an opinion is no excuse for inability to advise intelligently, or, if necessary, to restrain persons from a fatal mistake. Therefore, the other four factors in our problem demand all the more careful study. While the difference between a simple deformity and blindness is evident, it is not easy to say whether the recurrence of a given defect is "possible" or "probable." Our decision, then, must be based on three groups of data: first, whether the defect is inherited as a dominant or a recessive; second, whether it is a sex-linked characteristic, and, third, whether both families show the defect.

A few illustrations will show how these four cardinal conditions in our problem may serve as the basis for an opinion by an ophthalmologist when he is called on to give advice in the case of a proposed marriage. Thus:

A. When we have to do only with a deformity, and its reappearance is doubtful, no special objection need be raised.

B. When we have to do only with a deformity, and its reappearance is probable, the parties to the marriage should both be warned of the probability of the reappearance of that defect in their offspring.

C. When we have to do with blindness, and its reappearance is doubtful, a stricter attitude toward the union can be assumed.

D. When we have to do with blindness, and its reappearance is probable, the question assumes its most serious aspect. If the family history shows that this defect is in reality dominant, then half the children on the average will develop the defect; or even if the defect is recessive, but occurs in both families, the danger is practically the same.

Another phase of the same problem is presented when a couple is already married, and with little or no history on either side of eye defect; yet in spite of that, for reasons which we do not know, one child after another, blind or partly blind, is born to these parents. This congenital blindness is in one way quite different genetically from hereditary blindness, but from the standpoint of eugenics, families with hereditary and with congenital blindness may be considered together as one group and classed as hereditary. It is desirable to appreciate how important this group is, but space permits here only the categorical statement of a few facts, which, properly presented, would fill a small volume. These facts are:

(*a*) The number of this group in the United States is considerable. It has been estimated at about 8,000 and upward. According to the census of 1910, the total number of blind was 52,272. Counting unavoidable and admitted errors in that census, the results of subsequent surveys, and increase of population, the National Committee for the Prevention of Blindness estimated the number of blind in 1917 at from 100,000 to 110,000. According to the data given by Best in his exhaustive and recent study of the blind in this country, the proportion of hereditary and congenital blind is considerably larger than here stated. But in giving estimates, the minimum limit is evidently the safest.

(*b*) The cost also is considerable. According to statistics carefully collected in Massachusetts and elsewhere, the average cost per year of each blind person in and out of institutions is at least $475. This gives us a total annual cost of some $3,800,000.

(*c*) It is unjust to the blind to allow them to be brought into existence simply to lead miserable lives.

(*d*) It is unjust to taxpayers to be compelled to support them.

(*e*) The longer we delay action to prevent this blindness, the more difficult the problem becomes.

(*f*) A large part, if not all, of this misery and expense could be gradually eradicated by sequestration or by sterilization, if the transmitter of the defect preferred the latter. An idea of this plan is given by the somewhat similar one for dealing with feeblemindedness. In 1913, laws for sterilization, under certain circumstances, had been passed in twelve states and proposed in nine others. Bulletin 10 of the Eugenics Record Office, Cold Spring Harbor, L. I., N. Y., gives a map showing the status at that time of such legislation. Where such eugenic laws have been enacted or favorably considered, probably existing laws could be properly amended or new laws passed, to prevent this form of blindness. The same bulletin gives the form of a model law for this purpose. It was prepared by committees composed of the most eminent physicians, surgeons, sociologists, students of genetics and similar experts in this country. That law could be made applicable to the prevention of hereditary blindness, but with an important difference, which makes the prevention of this form of blindness comparatively easy and inexpensive. No legal action is essential until after a marriage has been found to produce blind children, and even then sequestration of the transmitter of the defect may be substituted for sterilization. Moreover, if this sequestration is of a kindly nature, with congenial occupations suited to the intelligence and social tastes of the subject, the sense of restraint is slight, since it is reduced to the minimum. This is not theory but experience, as shown especially by the colonies for the feebleminded established by Dr. Charles Bernstein of the State Custodial Asylum at Rome, N. Y.

WHAT ARE WE GOING TO DO ABOUT IT?

In other words, we have all this misery and expense, both of which are largely unnecessary; we have also an effective method of relief prepared by committees of our foremost experts and already well supported, in principle, by public opinion. What are we going to do about it? That is the question at last forced on ophthalmologists—especially on the Section on Ophthalmology of the American Medical Association. Shall we complacently continue to do nothing, thus retarding social advancement and even ophthalmology itself? The answer to this question involves many details, both of principle and of method, far too complicated for discussion now. But in executive session a motion will be made for the appointment of a committee to report on this subject another year. If at that time or later, some plan can be formulated for the prevention of this form of blindness, it will perhaps seem worth while for us to have directed our attention now, even in this hasty manner, to the relation of hereditary eye defects to genetics and eugenics.

ABSTRACT OF DISCUSSION

Dr. Horatio H. Newman, University of Chicago: This occasion gives me an opportunity of expressing an idea that has long been at the back of my mind, that cooperation between the professional ophthalmologist and the professional genetecist might lead to far reaching results in both fields. This idea was suggested to me some years ago by a piece of genetic work which fell into my hands quite accidentally. While instructing a class in genetics at the University of Texas I dealt with night blindness as an example of one type of heredity. I made a statement that night blindness was a partially sex-limited character, appearing in every generation, but largely restricted to males.

After the class a young woman said that there was something like hereditary night-blindness in her family, but it did not follow the law stated. I found that there was quite a large family connection who were night-blind and that the defect was inherited as a sex-linked character. This led me to work out the data of optic defects for five generations of this family, which was published some years later in the *British Journal of Genetics.* The point I wish to bring out is the great difficulty that I had as a genetecist in handling that data. If I had had the cooperation of an ophthalmologist the task would have been greatly simplified. As it was I had to depend on advice kindly offered by Nettleship, advice which though meager was of the utmost value.

That, then, will bring out my point, that it would be a very valuable thing if the ophthalmologists and the genetecists could actually get together in working out some of these problems that concern these two fields.

I think I am safe in saying that nothing equals the data of ophthalmology for the study of human heredity. And particularly is that true in connection with sex-limited and sex-linked heredity. We have found in our experiments on a number of the lower animals, that some characters are inherited in a peculiar way in a sex-limited and others in a sex-linked fashion. A sex-limited character is one that is limited to the male sex, while a sex-linked character may, under certain conditions, appear in females also. The mechanism of sex-linked heredity has been worked out and may be explained by a diagram (explanation of diagram omitted). This illustrates but one of the many interesting phases of the genetics of optic defects.

Dr. F. Park Lewis, Buffalo: Dr. Howe's paper naturally resolves itself into three distinct parts: that dealing with the mendelian law, which is a science in itself; that dealing with its application economically and socially, and the question, finally, as to what shall be done about it.

The question of the mendelian law is one of the most interesting, probably, of all topics that has come before the scientific world in a generation. Our knowledge of it dates from the beginning of the present, twentieth century, although Mendel wrote in 1881 an essay in which he demonstrated on peas the application of his law. This essay was buried in the archives of a scientific society for all the years intervening between that time and 1900, when Bateson and others, working along the same lines, brought it to the surface and found that this Austrian monk had hit on a law of heredity the importance of which can scarcely be overestimated.

Its application in ophthalmology to the development of the eye is particularly interesting, but I shall have to speak only on the economic side of it, which seems of great importance as a war measure.

The most important product now which we are raising—and we are now considering the conservation of our products—is that of our children. What is done in regard to the development of our children during the next twenty years connotes what kind of a population we shall have twenty years hence. During the last three decades there has been a very rapid decrease in the birth rate among all English speaking people, as there has been among the French, until at the beginning of the war, in 1914, the proportion had been reduced from thirty-five in a thousand in England, to about twenty. The large number of males who are taken out of active service and sent abroad will still further decrease our birth rate during these years of war.

The classes of people whose birth rate continues high as a rule are those who live under the most unsanitary conditions. In the Polish population, where it is very crowded, the average number of members in a family is eight. In what we call the better classes of people, those who are more intelligent, the average number of children in a family is but three. It has been found that where people live in four room tenement houses, the number of children who live is about thirty-five in a thousand. Where they live in three room tenement houses the proportion is about thirty in a thousand. Where they live in one room tenement houses, the number who live is still further reduced. So that the housing problem means that we are losing the productive element in our population in very large proportion, just to the degree that we decrease the sanitary conditions under which they live.

Moreover, where defects of any kind exist, such as feeblemindedness, defects in vision or other characteristics, the grouping of people together is very apt to make those who are sufficiently closely related to have the same traits, and the possibility of perpetuating those traits, brought together, so that they are apt to marry. It happens that during the last twenty-five years I have been connected with the School for the Blind, and I have seen during those years the effect of the perpetuation of the defects of blindness in the most remarkable degree. Four generations ago two congenitally blind people married. The progeny, the result of that marriage, have been coming back to the school during those twenty-five years, until we have now had from one family, seventeen, and from another family of cousins, seventeen. Without going into the details of the economics involved, I may say that single marriage has cost the state of New York more than $50,000 for the education and maintenance of all of these blind people.

I was interested in the case of the prevention of ophthalmia neonatorum, because of the multitude of cases that I found in the School for the Blind who were blind as the result of birth infection. The number of children that are blind as the result of congenital atrophy was greater, and always has been greater than that resulting from ophthalmia neonatorum.

Dr. Clarence Loeb, Chicago: Assuming the correctness of the mendelian theory, we must remember that it was worked out with plants and animals, where there is more than one offspring of a single mating. In man, however, a single mating, as a rule, results in one offspring, seldom two and very infrequently three or more. I do not see that it necessarily follows that the facts in the former case, that is, where there are more than one offspring at a birth, are true in a case in which there is only one. But granting that the facts will be the same, the theory further demands that two of the same generation must mate, which never takes place in man under present circumstances. Formerly, and in the far dim past, brothers and sisters would mate, but at the present time this never takes place.

How can we assume that the mating of two strains, as in the case of the marriage of two blind, unrelated people, will have the same effect as the joining of two strains from the same source? As a matter of fact, the histories of the cases in which two blind parents, whether related or not, marry, show that the percentage of their children was no greater than when one blind and one seeing person married. Furthermore, the mating of the red sweet pea for example, with the white sweet pea, is the mating of normal characteristics, while the mating of a blind with a seeing person, for instance, a cataractous person with a seeing person, is the mating of a normal with a pathologic condition. How do we know that the theory will work out under those circumstances?

The histories of these cases show that it does not, as the percentage of children affected, whether there was more than one child from one family or not, ranges anywhere from 100 per cent to no per cent.; that is, all the children, to none of the children. There is no definite rule that can be followed. Take up a history and you are as likely to find all the children of such a marriage become blind as only one or none.

It is always possible for a theory to have exceptions, but where a theory such as Mendel's theory is applied to the inheritance of ocular conditions—and that is all I am speaking of; I am not talking about that theory as a whole—and you have so many exceptions, as the history of all the cases shows, I must say that I do not see that the mendelian theory can be applied, and that we can assume from that what the results will be as to the offspring. The only thing I can see is to collect as many cases as possible of the results of such a marriage, and from the number of children calculate what percentage is likely to become involved. If the mendelian theory were true as far as man is concerned, then as Dr. Howe suggests, instead of sterilizing the person, it would seem to me the thing to do is to allow a person who is affected to marry and then find out from his offspring which marry the ones who propagate the diseased condition, and sterilize them or prevent them from marrying and allow the other strains to continue to marry and have children.

Dr. F. G. Stueber, Lima, Ohio: It was Dr. Wiley who made the statement, that as a people, we have been giving too much attention to the breeding and raising of hogs, rather than to that of our children; but he thought that mankind should come next. Not to underestimate the other papers I regard this as one of the most important subjects, and believe it is the duty of every normal individual to contribute what he can for the betterment of the race. It is said, every child has the right to be well born, and I think it devolves on the profession and the press to enlighten the masses, the laity, believing that they will be ready to take that counsel and heed the advice.

Dr. Lucien Howe, Buffalo: I do not know of any brief statement more conclusive than the family histories of the pupils at the School for the Blind at Batavia, N. Y., as given by Dr. Lewis. They show the desirability of some action for the prevention of hereditary blindness.

As for objections to the mendelian theory raised by Dr. Loeb, that is for geneticists to decide. The fact is, however, that opportunities do occur for the breeding among human beings of eye conditions. For example, when one of a Northern race, from Ireland or Scandinavia, marries an Italian, we can observe the eye colors of the hybrids, and if first cousins of such crossings marry, the results can be followed in the second generation. In a similar manner opportunities are afforded occasionally for tracing serious eye defects. As fas as we know, these abnormal conditions follow the same mendelian law as do other conditions which we call normal.

Through the kindness of Professor Morgan and Dr. Bridges of Columbia University, I have been furnished with stock colonies of an insect now a classic subject for experiment. The specimens with deformed eyes and the eyeless variety I have bred through a considerable number of generations. Live specimens are presented in bottles for examination.

Finally, I ought to say that I did not make personally the bibliography or the new charts from the old family histories. The work was simply supervised in my office, by my wife and my secretary, and by the secretary of the editor of the bibliography in the *American Journal of Ophthalmology.*

Follow-Up Medical Inspection.—There is a strange lack of logic in the way we take care of our industrial children as compared with our schoolchildren. Medical inspection of schoolchildren has attained a place of considerable prominence in our child welfare problems, and we have almost come to regard as beyond the pale the school district so benighted that it pays no attention to the health of its schoolchildren. . . . All sorts of safeguards have been thrown around employed children in the shape of age limits below which they may not be employed, regulation of hours, elimination from obviously dangerous occupations, such as mining—all of which undoubtedly have their part in preventing injury to the health of undeveloped children. But the physical safeguards considered indispensable up to the moment the child begins work are not heard of after the doors of industry are closed behind him.—Florence I. Taylor, *Child Labor Bulletin,* February, 1918.

Clinical Notes, Suggestions, and New Instruments

CULTIVATION OF THE MENINGOCOCCUS UNDER PARTIAL OXYGEN TENSION

A POSSIBLE EXPLANATION OF THE POOR SUCCESS OF THE USUAL CULTURAL METHODS*

M. B. Cohen, M.D. (West Salem, Ohio)
First Lieutenant, M. R. C., U. S. Army
CAMP LEE, PETERSBURG, VA.

A method by which meningococcus cultures may be easily obtained in sufficient quantity for rapid agglutination has long been sought. Almost every bacteriologist has some special medium on which he relies. In many camps, primary isolation is attempted on some solid medium, such as rabbit's blood agar or sheep serum agar; in others, various liquid mediums are used.

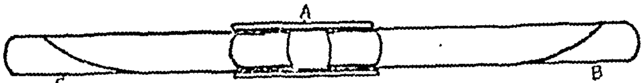

Fig. 1.—Apparatus for incubating under partial oxygen tension: *A,* rubber tube; *B,* tube with B. subtilis culture; *C,* tube with spinal fluid culture.

At this hospital it had been customary to make primary isolations from spinal fluid on solid mediums. When large amounts of fluid containing many organisms were planted, this method usually yielded a few colonies which had to be nursed along through several subcultures before rich growth was obtained. Only too often the culture was lost. Finally an enriched broth was used. A mass culture was made by pouring from 8 to 10 c.c. of spinal fluid into 100 c.c. of human serum glucose infusion broth. Usually within twenty-four hours a good growth was obtained; but when transplants were made from this broth to solid mediums, growth was meager or entirely absent. Frequent transplants had to be made to insure good growth, and many cultures were lost.[1]

It occurred to me that the explanation of this phenomenon was to be found in the fact, to which attention had previously been called,[2] that the meningococcus is a micro-aerophil, and

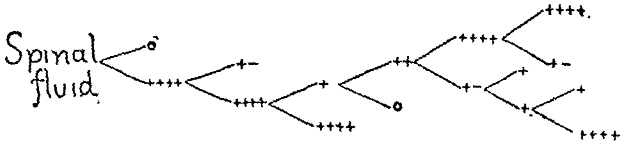

Fig. 2.—Adaptation of the meningococcus to changes in oxygen tension: Upstrokes, aerobic cultures; downstrokes, partial tension cultures; +—, doubtful growth; ++++, very rich growth.

that only a few individuals are sufficiently facultative to grow under aerobic conditions. To test this idea, the following method was adopted:

Each specimen of spinal fluid was divided into two parts. One portion was poured into a bottle of glucose infusion broth; the other was centrifuged, and a loopful of the sediment was planted on each of two slants of human serum glucose infusion agar. One slant was incubated aerobically; the other was placed under partial oxygen tension by connecting the slant to a freshly inoculated agar slant of *B. subtilis* by means of rubber tubing (Fig. 1).

Confluent growth over the whole surface of the slant was usually obtained in the partial tension cultures, while only one or two scattered colonies could be found on the aerobic slant if there was any growth at all. The broth cultures grew well; most of the growth was found near the bottom of the 100 c.c. bottle that was used. Aerobic and partial tension transplants were made from each broth culture; partial tension growth was always rich, aerobic growth was always scant.

[2] Cohen, M. B., and Markle, Louis: A Method Which Greatly Facilitates the Culture of the Meningococcus, The Journal A. M. A., Oct. 28, 1916, p. 1302.

Figure 2 shows in graphic form the approximate adaptation of the meningococcus to changes in oxygen tension. Doubtful growth is indicated by + —; very rich growth by + + + +. The upstrokes indicate aerobic cultures, the downstrokes partial tension cultures. This chart makes these three points very clear:

1. Much better growth in primary cultures is obtained under partial tension conditions.
2. It is quite difficult to get aerobic strains from partial tension ones.
3. Aerobic strains when split off from partial tension ones have a tendency to remain aerobic, and do not grow at all well in lower pressures of oxygen.

For the isolation of meningococci from mixed cultures or from the nasopharynx, a very simple method of partial tension plating has been used.[3] It consists briefly of two notched Petri dishes inverted over a glass tube on a glass plate and sealed to the plate with wax (Fig. 3). In one Petri dish is placed the material to be cultivated; in the other, a freshly made culture of *B. subtilis*. As this method is impracticable for meningococcus carrier work on a large scale, it is hoped that in the near future the optimum reduction in oxygen tension necessary for meningococcus culture will be measured and that simple and practical methods for such culture will be worked out.

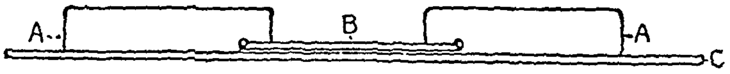

Fig. 3.—Apparatus for partial tension plating: *A, A*, inverted Petri dishes; *B*, glass tube; *C*, glass plate.

CONCLUSIONS

1. The meningococcus is a micro-aerophil, and partial oxygen tension methods of culture should be adopted for its isolation.

2. Relatively few meningococci are capable of aerobic growth. The growth ordinarily obtained by aerobic methods of culture consists of those organisms, which constitute the small minority of meningococci, that are capable of adaptation to full oxygen tension. This explains the statements made by many authorities, and found in many standard works on bacteriology, that large amounts of exudate must be planted to get suitable primary growth.

THE BLOOD PRESSURE IN GOUT

Jacob Rosenbloom, M.D., Ph.D., Pittsburgh

The literature contains few data on the blood pressure in gout. It is reasonably well established that certain of the purin bases are hypersensitive in action. Desgrez and Dorléans[1] have shown experimentally that the injection of xanthin and of uric acid causes an increase of blood pressure. It is generally understood that in gout a high pressure is the rule with increasing hypertension during the acute attacks (pain), and in the later stages hypotension develops associated with cachexia, acidosis and cardiac weakness. The hypertension is supposed to be of some value in distinguishing between lesions of the joints, the skin and the eye, as to whether they are tuberculous or gouty in origin, on account of the fact that in tuberculosis the blood pressure is usually low.

In the past ten years I have carried out frequent blood pressure readings on four patients with classical gout, all subject to acute attacks of gout, and the results are of some interest.

The accompanying table presents the data obtained in this study.

BLOOD PRESSURE OBSERVATIONS ON FOUR PATIENTS WITH GOUT

Case No.	Year	Month	Age	Systolic Pressure	Diastolic Pressure	Clinical Findings
1	1908	2	42	130	100	No acute symptoms
	1909	3	43	140	100	No acute symptoms
	1910	1	44	190	100	Acute attacks
	1910	8	44	130	100	No acute symptoms
	1911	2	45	135	90	No acute symptoms
	1911	12	45	135	100	No acute symptoms
	1912	2	46	135	100	No acute symptoms
	1913	1	47	200	100	Acute attack
	1914	1	48	140	100	No acute symptoms
	1915	2	49	140	100	No acute symptoms
	1915	11	49	195	100	Acute attack
	1916	3	50	135	90	No acute symptoms
	1916	10	50	140	90	No acute symptoms
	1917	2	51	210	110	Acute attack
	1917	8	51	130	100	No acute symptoms
2	1910	1	44	120	90	No acute symptoms
	1910	8	44	195	100	Acute attack
	1911	2	45	130	90	No acute symptoms
	1911	10	45	120	90	No acute symptoms
	1912	3	46	120	80	No acute symptoms
	1913	4	47	215	100	Acute attack
	1914	2	48	130	90	No acute symptoms
	1915	1	49	120	85	No acute symptoms
	1915	10	49	120	80	No acute symptoms
	1916	2	50	210	100	Acute attack
	1917	1	51	130	90	No acute symptoms
	1917	11	51	220	110	Acute attack
	1918	2	52	120	80	No acute symptoms
3	1913	2	58	230	110	Acute attack
	1914	1	59	120	90	No acute symptoms
	1915	2	60	220	110	Acute attack
	1916	4	61	110	80	No acute symptoms
	1916	12	61	115	80	No acute symptoms
	1917	3	62	220	110	Acute attack
	1917	12	62	110	80	No acute symptoms
4	1913	2	60	240	120	Acute attack
	1914	1	61	110	80	No acute symptoms
	1915	1	62	110	70	No acute symptoms
	1916	2	63	230	110	Acute attack
	1917	1	64	240	120	Acute attack
	1917	10	64	110	80	No acute symptoms

A study of this table shows clearly that hypertension was not present in the cases of gout studied, except during the presence of an acute attack of gout. Between attacks the blood pressure tended to be lower rather than higher than the normal.

Jenkins Arcade.

FURTHER STUDIES ON THE PRESERVATION OF COMPLEMENT BY SODIUM ACETATE

B. W. Rhamy, M.D. (Fort Wayne, Ind.)
Captain, M. R. C., U. S. Army
Fort Omaha, Neb.

Sufficient time has now elapsed to convince all serologists, who have investigated the preservative properties of sodium acetate on guinea-pig complement,[1] of its value. Since Army service has interrupted my studies, I desire to submit my present data in order that investigators who have the facilities may, if so inclined, work out the interesting problems indicated. It is hardly necessary to state that any step which makes for stability and simplification of laboratory technic, no matter how simple, may, in its application, be of tremendous value. One of the greatest complications to the Wassermann technic was the unstability of complement, and it occurred to me that if anything could be found to stabilize this very essential component it would be of considerable value. I therefore set about systematically to test the chemicals at hand in my laboratory for their respective effect on blood, with particular reference to complement, and their effect on the Wassermann reaction.

Three agents were found which did not interfere with the Wassermann reaction, which had no hemolytic properties, which did not prevent hemolysis and, therefore, did not destroy complement. They were: (1) sodium acetate, C. P. (in any strength); (2) camphor crystals, and (3) 0.5 per cent. phenol (carbolic acid).

---

[1] Desgrez and Dorléans: Compt. rend Acad. d. sc., 1913, **156**, 93.

[1] Rhamy, B. W.: Preservation of Complement: A Preliminary Report, The Journal A. M. A., Sept. 22, 1917, p. 793.

The solutions of sodium acetate and of 0.5 per cent. phenol were made up in physiologic sodium chlorid solution (0.85 per cent.) in distilled water. I have not as yet determined whether 0.5 per cent. phenol or camphor crystals will preserve complement or, if so, whether either would act better than sodium acetate. It has been shown that a minute crystal of camphor will, by inhibiting germ growth, preserve amboceptor and stabilize its unit of strength. In passing I desire to recommend the formaldehyd method for preserving red cells.[2]

Ordinarily red cells kept in physiologic sodium chlorid solution in the refrigerator will begin to hemolyze in about forty-eight hours. When the formaldehyd solution (1.25 c.c. solution of formaldehyd in 1,000 c.c. physiologic sodium chlorid solution) is used, hemolysis begins in about a week. The formaldehyd must be washed out before use, as it is anticomplementary. My procedure is to take the human cells left on separating patient's serum, cover them without washing with about five volumes of the formaldehyd solution, and keep in an ice box. They are washed when needed.

For the preservation of complement I have found that sodium acetate is ideal. It has the following properties:

(*a*) It has no hemolytic action.

(*b*) It is not anticomplementary.

(*c*) The solution can be sterilized.

(*d*) Dissolved in physiologic sodium chlorid solution, it has the same hydrogen ion concentration as blood P_H 7.4.

(*e*) It preserves and stabilizes complement from two to three months in the ice box, or two weeks at room temperature.

(*f*) It can be used in any strength from 5 to 50 per cent. or in crystal form.

(*g*) Its preservative properties are not antibacterial, and therefore must be physicochemical.

(*h*) Added to whole blood in certain strengths, it prevents coagulation.

(*i*) It will preserve human complement.[3]

In preparing complement, it is best to sever the neck arteries of the guinea-pig and obtain all the blood. As soon as the clot is well formed, it is broken up gently and centrifugalized. The serum is pipetted off and a 40 per cent. dilution of all the serum immediately made with 12 per cent. sodium acetate solution, thus preserving the full complementary strength. Placed in the ice box, it will keep until the whole amount is used up. In this dilution the final concentration of acetate is two thirds of 12, or 8 per cent.

From 10 to 12 per cent. stock solutions of sodium acetate work best for the following reasons: Sodium acetate has weak bactericidal power, so that a 50 per cent. solution keeps the serum clearer than does a 5 per cent. solution. If the serum diluted with a 5 per cent. sodium acetate solution is contaminated, it spoils rapidly, losing its complementary activity in four weeks or less in the ice box. On the other hand, although the 50 per cent. acetate solution prevents germ growth except mold, there comes a time, usually in about three weeks, when this complement solution suddenly becomes inert. (Fifty per cent. or saturated sodium acetate solution added to serum to make a 40 per cent. dilution causes a slight crystalline precipitate, the supernatant fluid containing the complement.) Using from 10 to 12 per cent. sodium acetate solution as the diluent and making a 40 per cent. dilution of the guinea-pig serum is the ideal. Such a complement solution prepared sterilely has retained its complementary activity as long as three months in the refrigerator and for two weeks at room temperature in a sunlit window in August. The loss in unit strength is gradual, about 0.02 per week. For example, a 40 per cent. acetate complement dilution, the Wassermann unit of which would be 0.1 c.c., would probably be 0.125 the second week and 0.15 the third or fourth week.

On account of the variability in hemolytic resistance of red cells,[4] it is necessary to retitrate this complement dilution each time a new batch of cells is used. If used in this manner, sodium acetate has no deleterious effect on the Wassermann reaction. Indeed, if anything, the reactions are clearer cut with its use. In the 12 per cent. acetate complement dilution, germ growth occurs when contaminated; but my experience has been that this does not affect the complementary activity. I have many times used such a complement cloudy with bacterial growth but with comparatively strong complement unit. Further the addition of 10 per cent. Sodium Acetate to Culture Media (Dextrose agar) did not inhibit the growth of Streptococci. It is obvious, therefore, that the action by which acetate preserves complement must be in some way a physicochemical phenomenon, that is, that complement enters into a loose combination with sodium acetate.

This opens a very interesting and fertile field for investigation as to the nature of this elusive labile substance called complement, and suggests the possibility that it is an enzyme with definite chemical composition. As to the property sodium acetate has, as I have found, of preventing coagulation and at the same time not destroying complement, it may be that it would be of more value in blood transfusion than sodium citrate, which does destroy complement. It would therefore be of value to determine its toxicity, the minimum amount necessary to prevent coagulation, and whether or not the presence of complement makes blood more suitable for transfusion.

CHRONICALLY ENLARGED SPLEEN (MALARIAL?)

J. C. VanNuys, M.D., Lufkin, Texas, and M. B. Stokes, M.D.,
Houston, Texas

Mrs. B. T., aged 34, was one of fourteen children, ten of whom, five boys and five girls, lived to be grown. Three sisters and four brothers are now living. The father died of dysentery at the age of 68. The mother is still living, aged 68.

At the age of 10 years the patient had had a prolonged attack of fever, during which the spleen had become enlarged and dislocated downward. During this attack of fever, she had had severe constipation. Since the attack she has had many similar ones, each being accompanied by an enlargement of the spleen. Each time, after the subsidence of the temperature, the splenic enlargement decreased, but the tumor could always be felt in the hypochondrium. Ever since her first attack of fever, she has been obstinately constipated.

She was married at the age of 21, and is the mother of six children, three boys and three girls, all healthy and robust. Her husband has been dead a year. She has been in bad health her entire married life, being always worse, if not practically helpless, during her periods of gestation. During each pregnancy, she suffered severely with nausea, and pain in the left side of the abdomen.

Dr. VanNuys was called to see her, Nov. 5, 1911. The patient had been seized the night before with severe cramp-like pain in the abdomen, and diarrhea. From this time until December 7, the date of the operation, she had many attacks of severe pain in the abdomen, which were cramp-like in character, each attack leaving the abdomen increasingly tender. Her temperature ranged from 99.2 to 100.2 F. She persistently refused the advice of her physician, that an exploratory operation be performed.

During a lull between attacks, a bimanual examination was made by Drs. VanNuys and Bledsoe. This examination revealed the facts that all the pelvic landmarks were obliterated, and that the uterus was firmly fixed.

About December 1, she finally consented to an operation and was brought to Houston. On her entrance into the hospital her condition was very poor. After she had had a few days of rest, we felt justified in proceeding with the operation.

[3] Noguchi, Hideyo: A Method of Facilitating the Serum Diagnosis of Syphilis Under War Conditions, The Journal A. M. A., April 27, 1918, p. 1252.

[4] Rhamy, B. W.: Variations in Resistance of Blood Cells to Lysis, The Journal A. M. A., Nov. 17, 1917, p. 1728.

When the abdomen was opened a large reddish purple tumor mass was revealed, plastered over by many adhesions involving the omentum, intestine and pelvic organs. After the tumor mass had been freed from the surrounding viscera, something of its character and origin was determined. It had the appearance and physical characteristics of a cyst. A large trocar was thrust into the tumor, but the capsule was so friable that it split in many directions, allowing a thick reddish purple fluid to pour out. Further dissection revealed the fact that the tumor mass was the remains of a large spleen, the pedicle of which had become twisted, shutting off the circulation and resulting in moist gangrene of the organ.

The pedicle was ligated, as much of the tumor was removed as was possible, cigaret drainage was instituted, and the abdomen was closed. The patient's general condition was very bad when she left the table.

Microscopic examination of some of the less necrotic pieces of the tumor was made by Dr. Martha Wood, corroborating the operative diagnosis.

After three stormy days, the patient began to rally, and was able to leave the hospital and to return to her home for Christmas, although the wound continued to drain freely until January 30, since which time she has been perfectly well.

COMMENT

The location of the patient's home in a district of Texas, notorious at the time of her girlhood for the prevalence of malaria, in addition to the diagnosis of malaria given to the patient by the family physician who saw her during her first attack, leads us to the assumption that the primary enlargement of the spleen was malarial in origin.

An Error of the Wassermann Test.—A test that I have used has proved many negative results to be positive. I perform the Wassermann test exactly the same as the original test, using the four hour ice-box incubation. There is an adjustment in the use of the amboceptor. Some technicians employ twice the smallest degree of amboceptor used in the titration that produces hemolysis. Others employ as high as three and four times the smallest degree of amboceptor as a unit. Using a larger amount than the titration allows gives more negative results, some of which prove to be positive. I wish to emphasize the fact of using the smallest degree of amboceptor as a unit, along with twice the smallest degree as a unit. Cases that are negative with twice the smallest degree as a unit and are + + + + with the smallest degree as a unit should be recorded as + + + +, provided, of course, the test control and the known serum show complete hemolysis. Accordingly, any cases that show + +, + + + or + + + + are to be recorded as such. Doubtful reactions are to be excluded. My results have been very satisfactory. I have found many + + + + reactions that were reported to me as negative by reliable laboratories, and my results have proved to be correct. Once more I urge that the smallest degree of amboceptor as a unit be used with twice the smallest degree as a unit. Many well known technicians have stated that the reactions with the smallest degree of amboceptor as a unit have proved not to be "snappy." However, sometimes reactions occur that are too "snappy," which might prove to be positive if the smallest degree of amboceptor as a unit was used also. Many errors in diagnosis are made because of a false Wassermann report.—Emanuel Jacobson, Brooklyn.

Health Insurance.—Today, for example, we possess a mighty power to fight disease. To the wealthy class this scientific knowledge is available; to the poverty-stricken it is doled out in charity dispensaries. But for the masses of the working population—in the United States alone among the great industrial nations—such treatment is not available. Through a properly organized system of health insurance it would be possible to bring the world of medical science to the aid of the humblest wage earner.—John B. Andrews, *The Survey.*

Military Medicine and Surgery

THE EYES OF THE ARMY*

ALLEN GREENWOOD, M.D.
Major, M. R. C., U. S. Army
BOSTON

When an ophthalmologist studies the new regulations for drafted and enlisted men he is immediately confronted with the fact that men with low vision, which can be raised by glasses to the required standard in one eye, are enrolled for some form of limited military service, and at once the thought comes, How are these men to be supplied with glasses if they have none, and how are lost or broken glasses to be replaced here, and overseas?

The problems are more easily solved for this country than for abroad; but to obtain the best solution, the work here and there must be coordinated. In the early days following our country's entrance into the arena of world conflict, the Subcommittee on Ophthalmology of the General Medical Board of the Council of National Defense took up these problems, which then, owing to a higher standard of visual requirements, were less difficult than at present, and a plan was worked out for adopting a standard type of frame for all soldiers, and for the establishing of a small optical shop to be connected with a special hospital for surgery of the head to be sent overseas.

Various types of frames were experimented with and the following specifications finally adopted:

> White metal, best stiff construction; 40 mm. round eye; special 0.055 inch full length cable temple 6½ inches; split joint end piece; 0.072 eye wire.
>
> Bridges assorted as follows: 8/12 of N1 ½ long shank; 3/12 of N1 long shank; 1/12 of N1 ½ regular.

When the members of the subcommittee were commissioned in the Medical Reserve Corps, these plans were enlarged and modified to fit new conditions, and carried into effect by the ophthalmic department of the Division of Surgery of the Head in the Surgeon-General's Office.

Some of the ophthalmologists in this country have criticized the standard frames adopted, and with justice, for it would be impossible to select any type of frame that could not be criticized. The frame adopted, however, with its three variations of bridge, seemed to those studying this phase of the problem to present the fewest faults. The criticism was several times presented by ophthalmologists that the three types of bridge did not allow for enough variations; but before adopting such, a set of these frames was given to several first-class adjusting opticians, who quickly demonstrated that any fit likely to be called for could be obtained from one of the three bridges. It is true that the bridges are stiff, but this disadvantage is more than balanced by the fact that, once properly adjusted by the skilled mechanic, they are likely to remain in place. The criticism, however, most frequently sent in pertains to the round eye piece, and the disadvantage that the cylindric lenses may be turned in the frames. This complaint is best answered by calling attention to the fact that all cylindric lenses when in place will be marked in the side at a point close to the middle of the temple attachment, and this pointed out to the soldier so that he can watch for any possible shifting. If experience proves that the rim cannot be tightened sufficiently to prevent the slipping round of the lens, then it is a simple matter for the optician to put a tiny bit of solder on the inner groove of the eye piece, and notch the lens at the proper point to fit this little projection. The critics have advocated an oval lens; but to see the tremendous disadvantage of this, one has but to consider the millions of extra cylinders and spherocylinders cut and edged that the optical units sent abroad would have to carry to meet all the degrees of axes called for, if frames with oval eye pieces had been adopted.

It has been decided by the Surgeon-General's Office to supply all soldiers and noncommissioned officers in this country and abroad with the glasses required. For the men in the cantonments, arrangements have been made whereby the prescription of the ophthalmic medical officers can be filled through the post exchanges and the Medical Supply Depot.

Steps were taken to have a first-class optician assigned to the special building in the various cantonments and base hospitals to assist in the adjustment of frames supplied to the soldiers through the exchanges. Many first-class opticians have been drafted or taken into the service, so that it was not difficult for the division surgeon in the various cantonments to find a qualified optician for this position.

Early in February, I received a cablegram, which had been sent by General Pershing, calling for optical units for overseas service to consist of a central optical shop, with surface grinding machines, and eight auxiliary units to establish optical centers in various locations in France. Capt. F. H. Edmonds, the Washington optician, was secured for the position of commanding officer of the units, and thirty-five other first-class mechanical opticians were secured, mostly by induction into the service of registrants from different parts of the country, who were highly recommended as skilled grinders, edgers, mounters and adjusters.

Each one of the auxiliary units was provided with a full equipment of cut and edged lenses, and supplied with frames and a kit of all tools necessary for the work of putting proper glasses into the frames, adjusting the latter, and repairing any frames that might be broken or otherwise injured. It was found that all of these supplies for each auxiliary unit could be packed in three of the regulation service suit cases, thus simplifying the transportation problem. A list of supplies issued a single unit is given in the accompanying tables. Lenses of strengths not included can be obtained on order from the central shop.

For the central optical unit, a full equipment of machinery for the surfacing and edging of lenses, together with a plentiful supply of glass and blanks, was provided. Electric motors, with all necessary belting and shafting, were, of course, included, the plan being to establish in some central location a manufacturing plant that could turn out from 150 to 200 pairs of lenses a day, and also take care of all repair work that would be likely to come in. All of the cut and edged lenses furnished for the auxiliary units, together with the equipment and machinery, were furnished by the American Optical Company of Southbridge, Mass., on record time, though this required their working nights, days and Sundays on the basis of eight hour shifts.

With this equipment and the skilled groups of men sent over, it should be possible to take care of the optical work in France with a high degree of efficiency. This is all made necessary by the fact that it is impossible to get this work done in the French shops. It is the expectation of the Surgeon-General's Office that future contingencies, as they arise along this line, can be properly cared for by enlargement of the present optical units.

OPTIC ATROPHY AND MULTIPLE PERIPHERAL NEURITIS

DEVELOPED IN THE MANUFACTURE OF EXPLOSIVES (BINITROTOLUENE)

ARTHUR S. HAMILTON, M.D.
AND
CHARLES E. NIXON, M.D.
MINNEAPOLIS

The great increase in the last three years in the demand for powerful explosives has not only enormously increased the number of employes in munition plants but also has doubtless added many workers who from lack of skill or from carelessness have rendered themselves more susceptible to the poisonous substances handled than would be the case with older and more experienced workers. At any rate, a large number of instances of industrial poisoning has appeared recently in such plants and a considerable literature bearing on the subject has appeared in Europe, and to a less extent in this country. Especially to be noted is the excellent article of Dr. Alice Hamilton.[1] Most of this literature is of English origin. Some contributions have appeared from German sources, particularly in reference to tetrachlorethane or dope poisoning, and in reference to benzene poisoning; but most of it is not available to use at this time. As no case of optic atrophy or of definite multiple peripheral neuritis has been reported, so far as the literature to which we have access shows, the following case may be of interest.

REPORT OF CASE

History.—J. B., man, aged 39, married, foreman in munitions factory, seen April 15, 1917, had one brother, five sisters and three children living and well. None were dead. The patient's father died at 63 of an accident. The mother died at 82 of old age. His general health had been good and he could recall no serious illness or injury. He had used very little tobacco and practically no liquor. There was no evidence of venereal disease, either by direct or indirect questioning. He had married at 35. He had worked in a munitions factory for two years, and before that as a fireman. In the factory his work had been with trivalene, a plant name for binitrotoluene.

Present Illness.—About one year before, one year after entering the plant, he first noticed numbness and prickling in the feet; in the course of five months this gradually spread to the knees. He had no pain, but described the sensation as "like an electric tickling." At the end of the five months he was placed on outside work, and in the course of one month the numbness gradually grew less, but did not wholly disappear from the feet. After one month of other labor, he returned to his work in the trivalene plant as foreman, and in this position did not come quite so closely into contact with the trivalene as before. For five months there was no special change in his condition, but he still had the numbness in the feet. At the end of five months he returned to his former work of direct handling of the trivalene in the "sweat house." In one week the numbness had increased in the feet and legs. Directly after, early in December, his sight began to fail, objects appeared blurred, and he could not see well to read. His vision was then 20/40 in the right eye and 20/70 in the left eye. He was slightly cyanotic and appeared anemic. Shortly after, he noticed a little numbness in the tips of the fingers, and this had continued ever since but had not changed much. During the month of March his eyesight failed rapidly, and he quit work, April 5, 1917. At this time, vision was 20/200 in each eye. Since then his sight has failed further; April 8, vision was 6/200 in each eye. At present he can get about without difficulty, but he cannot make out even the largest print and cannot even make out the outline of a face. The left eye is a little worse than the right. There is no history of jaundice or gastritis and no loss of sexual, bladder or rectal control.

When asked to give the experiences of other men who worked with him, the patient stated that when foreman he had a crew of four men working under him; but as they habitually did not like the work or could not stand the fumes of the trivalene, they were constantly changing, and he is unable to describe the effect of the trivalene very accurately on them. One man worked for about six months handling the trivalene, and in that time developed a numbness and swelling of the feet so that he could not put on his shoes. He quit in the spring, worked on a farm all summer, and recovered, but did not return to the plant. One man has worked in the trivalene for eight months with no apparent ill effect. He takes no special precautions. Two or three other men who worked varying periods of time complained of numbness and tingling in their hands and feet and of difficulty in their gait, and headaches were frequent among the workers. All the men are provided with good leather gloves; but the trivalene, which is oily as they begin handling it and later turns to a crystalline substance, soon saturates their gloves so that they have little protection even over the hands.

Physical Examination.—The patient is a well developed and well nourished man, slightly pale; height 5 feet 6 inches, usual weight 156 pounds, and present weight 148 pounds. In a period of four days of observation his temperature ranged from 97 to 98.2, pulse 55 to 71, but usually about 60, and blood pressure 134 systolic and 81 diastolic. The tonsils were submerged and showed no special signs of inflammation; the teeth were badly worn, and there was a moderate degree of pyorrhea and gingivitis. The glands were not enlarged; the lungs were normal. Except for a moderate thickening of the blood vessels, the circulatory system was negative. Liver and splenic dulness were not altered, and the spleen was not palpable. There was no abdominal tenderness.

All the cranial nerves were normal except as noted below. With the right eye the patient counted fingers at 14 inches and with the left at 10 inches. The visual field was normal to rough tests except that there was some unusual dulling at the central point. The fundus showed a rather well developed atrophy with pale disk and some swelling of the veins and contraction of the arteries. The right pupil was somewhat larger than the left. The left reacted fairly and the right poorly to light, and both only fairly to distance.

---

[1] Hamilton, Alice: Industrial Poisons Encountered in the Manufacture of Explosives, The Journal A. M. A., May 19, 1917, p. 1445.

Both had had "drops" instilled some days previously. A watch was heard in the right ear at 18 inches and in the left at twelve inches. Air conduction was better than bone in both, and the Weber test was negative. There were no subjective sounds at the time of the examination, but the patient stated that at the time he quit work he had "rumbling sounds" in both ears. Vibration sense was lost in the toes but present in the malleoli and upward. Joint sensibility was distinctly impaired in the toes. Neither sense showed any impairment in the fingers. Pain (pin prick) was usually appreciated in the fingers and in the feet and toes, but touch (cotton) was impaired in both. Tendon and muscle pain sense were normal. There was no incontinence of urine or feces, and sexual power was not impaired. Sweating was evident in the hands and feet.

The muscles were of good volume and tone, but the patient insisted that his strength was much impaired and that his legs would often give way under him. In all the tests he gave very fair responses. He complained of stiffness and of an occasional pulling up or jerking of the feet and legs, especially at night, and said that this seemed like an "electric shock." Coordination was good in the upper extremities and impaired in the lower. The patellar and abdominal reflexes were present but diminished. The Achilles, biceps, triceps, supinator, jaw, pharyngeal, palate, plantar, anal, bulbocavernosus and cremasteric reflexes were normal. There was no patellar or ankle clonus. A blood test revealed: hemoglobin, 80 per cent.; red cells, 4,900,000; white cells, 8,000: differential count: polymorphonuclears, 73.5 per cent.; small mononuclears, 19.5 per cent.; large mononuclears, 5.5 per cent.; eosinophils, 0.5 per cent.; other forms, 1 per cent. The cerebrospinal fluid was clear with no undue pressure. The Wassermann, Nonne, and gold tests and cell count were negative. The Wassermann test was also negative in the blood.

Treatment and Results.—Under treatment with laxatives and potassium iodid and sweating, the patient improved after about two months and has shown steady improvement since. In the month of February, 1918, he still complained of tingling and numbness in the toes. His vision was then 20/40 in the right eye and 20/60 in the left eye.

COMMENT

Binitrotoluene, known under the name of trivalene in the plant where this man worked, is the product of the second step in the nitration of toluene. When received as monotrinitrotoluene it is a heavy dark cherry colored oil, and in the process of the second nitration it changes to a crystalline substance looking much like brown sugar. As such it has a faint odor of bitter almonds and a bitter, acrid taste.

Like monotrinitrotoluene it is absorbed through the skin and mucous membranes and when so absorbed seems to have a marked transient and perhaps more or less permanent effect on the central nervous system.

In this plant, in addition to the patient here reported and those mentioned by him, there were two cases of pronounced mental aberration and one of somnolence. In the mental cases no delusions or hallucinations were manifested, but rather signs of mental dulness. The men were very quiet, with an aimless tendency to seclusion. One locked himself in an outhouse and was found only after one hour's search. He seemed stupid, could not understand or answer questions, and was mildly apprehensive. He would try to hide away, even in a room that offered no concealment, but still was docile and unafraid on contact with men. This condition persisted for about forty-eight hours, with later rapid improvement and complete recovery.

The other patient had, in addition, a marked cyanosis, with weak heart action, staggering gait and fainting. Recovery occurred within a few days.

The case of somnolence was most peculiar. The patient presented the picture of alcoholic intoxication in gait, speech and general appearance, with a very strong tendency to sleep. Not only was his muscular power diminished, but his coordination was poor. He could be got to his feet, but could not stand. With support he could with difficulty use his legs and feet, but not accurately. When lying down he would fall asleep while talking, even in the middle of a sentence. He said his mind was perfectly clear, but he could not keep awake. The knee jerks were slow in response, but increased in extent. The quadriceps could be seen to contract slowly as if in voluntary movement. He complained of marked diplopia, and occasional strabismus could be observed. The pupils were normal. The condition came on abruptly, was not more than twelve hours in development, and cleared away gradually after five or six days with final complete recovery.

Livingston-Learmonth and Cunningham,[2] in an article on the effects of trinitrotoluene on women workers, divide the symptoms into two classes, irritative and toxic, and the latter again into digestive, circulatory, cerebral and special. Under cerebral symptoms they say:

> Drowsiness is very common and many workers describe it as a sort of drugged feeling. Depression, lassitude and apathy are common. Transient loss of memory, slight disorders of sight (blurred vision, etc.), and a certain amount of transient peripheral neuritis have been noted in several of our cases. In severe cases delirium, coma and convulsions occur toward the end.

As terminal symptoms of trinitrotoluene poisoning, Rice[3] mentions delirium, light-headedness and flighty utterances, followed by a stage of coma lasting about twelve hours and ending in death.

Dr. Alice Hamilton[4] says:

> The symptoms that follow inhalation of benzol and toluol fumes or absorption of these are, in mild cases as in severe ones, the symptoms of intoxication by a substance with a special action on the central nervous system: Dizziness, confusion, transient excitement followed quickly by stupor, twitching, then exhaustion, loss of consciousness, with respiration at first rapid then slow, pulse rapid, temperature low.

She further adds:[5]

> Delirium, sometimes maniacal, is not rare; tetanic convulsions with marked opisthotonus and high temperature were described in one unusual case. Three cases developed meningitis before death.

In some cases of "dope" poisoning, which is said to "act on the nervous centers," nervous symptoms have been reported. Willcox[6] quotes Dr. Heffter and Dr. Kraus, who state that in Germany, where the "dope" contains more tetrachlorethane than the English varnishes, two types of symptoms develop: (1) gastro-intestinal and hepatic symptoms, and (2) nervous symptoms. The latter group of patients suffers from tremors, headaches, pains in the limbs, numbness, "pins and needles" of the extremities, loss of knee jerks and excessive sweating.

Koelsch[7] also noticed among the more marked cases of tetrachlorethane poisoning various nervous phenomena, as headache, paresthesias in the extremities, tremor of the hands, and paralysis.

Benzene (benzol, C_6H_6) and its homologues, according to Lehmann,[8] produce in man a condition resembling intoxication, dizziness, headache and gastro-intestinal disturbances; after a prolonged inhalation, motor and sensory symptoms develop.

These appear to be the only descriptions in literature available to us referring to any special effect on the nervous system; but the references here to blurred vision, transient peripheral neuritis, pains in the limbs, numbness, pins and needles, loss of knee jerks, etc., suggest clearly an involvement of the peripheral nerves and possibly also of the optic nerves.

As far as possible we have excluded other sources of poisoning in our case, and the evidence appears to us sufficiently strong to classify it under the heading given. The failure to show a loss or even marked diminution of the deep reflexes of the lower extremities we believe to be due to a possible beginning involvement of the lateral columns of the cord, suggested by the jerking of the legs and the sense of stiffness.

POSTMORTEM FINDINGS IN MEASLES-BRONCHOPNEUMONIA AND OTHER ACUTE INFECTIONS *

BALDWIN LUCKE, M.D., Dr.P.H. (Philadelphia)
Lieutenant, M. R. C., U. S. Army
CAMP ZACHARY TAYLOR, LOUISVILLE, KY.

During the past winter, necropsies were performed in sixty-two cases at Camp Zachary Taylor, Ky. The patients were soldiers, with one exception white, native born, physically and mentally sound, in the third decade of life, most of them country bred and from the central states. This uniformity of type permits comparative study.

The pathologic observations hereinafter described will confirm and amplify the observations reported by H. L. Alexander[1] that the infections at this camp underwent a changing history from pneumococcal, to measles, to streptococcal. It is shown that with the changes of the etiologic agent there was a distinct change in the pathologic condition of the lungs, parenchymatous organs and serous surfaces. The clinical side has been presented by Fox and Hamburger.[2]

In the fall of 1917, the etiologic agent was the pneumococcus with its customary results. Measles appeared late in October, causing the first death, November 7, from what is considered a typical measles pneumonia, with a catarrhal or purulent bronchitis. On the advent of the streptococcus infection, causing the first death, December 13, the pathologic picture changed, the bronchitis being now hemorrhagic, the pneumonia patchy and hemorrhagic, while the causative organism began to show a predilection for serous surfaces.

The principal causes of death as determined by necropsy are given in Table 1. Complicating lesions, occurring practically always, are not listed in this table as they are fully discussed later.

It is seen from this table that fifty-two of the sixty-two deaths were produced by acute infectious diseases, and that lesions of the lungs and meninges contributed, with one exception, all the primary lethal causes. It is a noteworthy fact that the intestinal tract was not involved in any of the infections, and no transmissible disease of it was responsible for death. This means that in this camp no typhoid, paratyphoid, dysentery, winter cholera or food poisoning and the like occurred. The ten deaths due to noninfectious diseases were mainly surgical affections or accidents not incurred in line of duty. These are not considered in this paper.

BRONCHOPNEUMONIA

Bronchopneumonia was the lesion most frequently found, thirty-five of the fifty-two cases presenting this change; in twenty-seven it was looked on as a primary cause of death.

To study more closely the effect of the various etiologic agents on the disease picture, all cases of bronchopneumonia are grouped into four classes:

A. Following measles; the *Streptococcus hemolyticus* isolated; 3 cases.

B. Following measles; the *Streptococcus hemolyticus* not isolated; 13 cases.

C. Not following measles; the *Streptococcus hemolyticus* isolated; 10 cases.

D. Not following measles; the *Streptococcus hemolyticus* not isolated; 9 cases.

The bronchopneumonia, then, was preceded by measles in sixteen instances, and not preceded by measles in nineteen cases. The streptococcus was isolated in thirteen cases, and not isolated in twenty-two cases. *In the latter group the pneumococcus was* frequently found. In a small number of cases, no bacteriologic studies were made.

TABLE 1.—CAUSES OF DEATH AS DETERMINED BY NECROPSY

Bronchopneumonia.............	27	Meningitis, meningococcic.......	5
Lobar pneumonia.................	8	Meningitis, streptococcic........	3
Empyema, primary...............	6	Meningitis, pneumococcic.......	1
Pericarditis, primary............	1	Meningitis, following mumps....	1
Noninfectious diseases...........	10		

The points analyzed are: the time of occurrence of bronchopneumonia after the first definite symptoms of measles appeared; the duration of the bronchopneumonia from the day it was first recognized to the day of death; the type of bronchopneumonia, and the changes in the viscera. Of the latter only the pleurae, bronchi, spleen and kidneys showed constant and important alterations. The results are collected in Table 2.

TYPES OF BRONCHOPNEUMONIA

Four anatomic types of bronchopneumonia were observed. These were found with such regularity that they were classified as Types I a, I b, II and III. The first two types were mainly found in bronchopneumonia following measles; the last two in hemolytic streptococcic infection.

Type I a. The lungs are large, expanded, and very heavy. The weight of each lung ranges from 600 to 1,100 gm., the combined weight often approaching 1,500 gm. The pleural surface may be smooth and glistening, but more often is dulled and overlaid with fibrin exudate. The general surface of the lung is mottled, dusky gray-red with a distinct bluish tint. Small, ill defined areas of elevation and depression are often seen. On palpation, innumerable small, firm areas are felt throughout all the lobes. The lungs may be said to have a "shotlike" feel. The intervening lung tissue is boggy. The cut surface is pale bloody-red; light pressure causes the outpouring of a large amount of moderately bloodstained, frothy serum. Scattered over the entire cut surface are numberless rounded, light gray-red, definitely raised firm areas, appearing very much like large, gray miliary tubercles. They usually distinctly surround a small bronchial branch, and measure from 3 to 5 mm. in diameter. About one half to one third of the entire lung tissue is taken up by these consolidations.

---

[8] Lehmann: Arch. f. Hyg., 1911.

* From the Cantonment Laboratory, Base Hospital, Camp Zachary Taylor, Ky.

[1] Alexander, H. L.: Hemolytic Streptococcus Causing Severe Infections at Camp Zachary Taylor, Ky., The Journal A. M. A., March 6, 1918, p. 775.

[2] Fox, Herbert, and Hamburger, W. W.: The Streptococcus Epidemic at Camp Zachary Taylor, Ky., The Journal A. M. A., June 8, 1918, p. 1758.

The bronchial branches stand out distinctly; from many, a thick, yellow, purulent fluid exudes. The bronchial mucosa is swollen and somewhat reddened. In some instances the bronchial tubules are dilated, forming small and rather smooth-walled cylindric or globular bronchiectases. The peribronchial lymph nodes are swollen, juicy, and dark grayish red. Their cut surface is very moist and has a mottled appearance.

Type I b. This is a later stage of the preceding process. All the various anatomic changes are more accentuated. The pleura is generally covered with soft yellow exudate. The organ is markedly distended and the combined weight of the lungs approximates 2 kg. The surface of the lung lacks definite rounded contour, showing many smaller and larger elevations, blue, reddish brown or purplish in appearance fading gradually. Subpleural punctate hemorrhages are occasionally encountered. The nodules palpated are larger than in the preceding type, but are of approximately uniform size. No large consolidated patches are felt. The anterior edges of the lung and the upper lobes may be inflated. The cut surface is moderately bloody. The general color is grayish red; innumerable well outlined, slightly, but definitely raised areas of a yellowish, grayish red or dark reddish brown surround the bronchial tubes. These consolidations vary from about 5 mm. to 1 cm. in diameter. The grayish areas are quite firm, while the yellowish patches are more or less softened. The bronchi show the same general changes as in the preceding type.

The principal features of Types I a and I b are, then, marked edema, the discrete character of the consolidations, *their distinct peribronchial situation* and their occurrence in all lobes. They vary in color, size and consistency, being small, firm and light gray in the earliest stages and then becoming larger, grayish red, dark red, and finally yellow and softer in appearance and consistency. The aggregate total of these areas would equal from one third to two thirds of the entire pulmonary substance, depending on the stage. A purulent bronchitis accompanies the lesions. The marked edema and the very small size of the consolidations often obscure the clinical picture of bronchopneumonia.

Type II. The pleura usually shows inflammation; empyema is often present and the lung is slightly or not at all enlarged. On palpation, various sized areas of resistance are noted. On section, the lung tissue is not nearly so moist as in types I a and I b. The areas of consolidation are several centimeters in diameter, of irregular contour, slightly or indefinitely raised *and not visibly peribronchial*. They vary in color from dark red to grayish yellow and often show a surrounding hemorrhagic zone. Usually the lesions are confined to one or two lobes. The bronchial branches are not unduly distinct and almost always show a deep red hemorrhagic mucosa and exude a sanguineous or sanguinopurulent fluid. The peribronchial lymph nodes are large and more reddish than in Types I a and I b. This type of bronchopneumonia resembles the ordinary kind seen in the necropsy room excepting the great frequency with which empyema occurs and the hemorrhagic character of the bronchitis.

Type III. Confluent bronchopneumonia or pseudolobar lobular pneumonia. A large part of a lobe is consolidated. The cut surface is moist and finely granular; the granularity being less distinct than that of lobar pneumonia. The lobes show several distinctly different processes. While the general color is brownish red, there are areas more yellowish and others more grayish or reddish; but all fade into one another, so that the end-picture appears at first glance more homogeneous than heterogeneous. The pseudolobar pneumonia is, therefore, made up of a number of units placed so closely together that they give the appearance of a single large consolidated patch.

MEASLES-BRONCHOPNEUMONIA

Table 2 shows that nine of the sixteen cases of bronchopneumonia following measles were of Types I a or I b. The spleen was slightly enlarged, being about one and one half to twice its normal size and averging 225 gm. in weight. The capsule was smooth and transparent, the outside cover being bluish red. The organ was somewhat less firm than normal, the cut surface dull red, the trabeculae of usual size; the splenic follicles were prominent, a light yellowish gray, and about twice their normal size. The splenic pulp showed no gross changes. The splenic picture is, therefore, one usually termed "acute follicular splenitis."

In five cases not showing Type I bronchopneumonia, complications were present which may have influenced the character of the lung lesions. In two instances a streptococcic infection was superimposed. In others, epidemic meningitis, lobar pneumonia and erysipelas coexisted. As to the development of the bronchopneumonia after the onset of measles and as to its duration, no uniformity existed, as can be seen in Table 2. The kidneys, in a majority of cases, showed various grades of acute parenchymatous nephritis.

ETIOLOGY OF MEASLES-BRONCHOPNEUMONIA

One of the dominant symptoms of measles is bronchitis appearing early and often persisting. The cause of this bronchitis is not known, but it is reasonable to suppose that it is due to the virus of measles. In this connection, I would call attention to the recent work of Tunnicliff,[3] who isolated a small anaerobic coccus from the blood in forty-two out of fifty cases of measles. In the present epidemic, hemolytic streptococci appeared in the throat in a large percentage of the cases of measles, general medical cases as well as apparently normal cases. Detailed bacteriologic figures will be given in a further paper by Levy and Alexander.[4] The great invasive power and virulence of the streptococcus found in the present epidemic is demonstrated at necropsy by the extensive involvement of all the principal organs. It is most likely that they will readily thrive in an already pathologic field, that is, the inflamed bronchial tubes of measles. In the early postmortems, before the epidemic of streptococcus had appeared, a definite type of measles-bronchopneumonia was found, here termed Type I a and Type I b. The anatomic picture was essentially *the same as that seen for several years in the necropsy* room of the Philadelphia General Hospital by myself, and which has been described by several observers. From a study of the necropsies here, I am inclined to believe that a true measles-bronchopneumonia, caused by the virus of measles, exists. Since, however, a number of organisms, as pneumococci and streptococci, occur almost constantly in the throat, *secondary* invasion will take place in the bronchial system and one or another organism will be found in the bronchial branches and pulmonary lesions. If these organisms possess marked virulence and invasive powers, and if they intrude early in the disease, the anatomic picture will be determined by the invading bacteria, and the possible influence of the measles virus may be

TABLE 2.—FINDINGS IN THIRTY-FIVE CASES OF BRONCHOPNEUMONIA

No.	Days after Onset of Measles	Duration, Days	Type	Pleurae	Bronchi	Spleen	Kidney	Other Findings
A. Following measles; due to Streptococcus hemolyticus (3 cases)								
18	..	4	I b	R., empyema	Acute purulent bronchitis	Acute diffuse splenitis	Acute parenchymatous nephritis	Acute fibrinous peritonitis; acute fibrinous pericarditis
34	6	25	II	Double empyema	Acute hemorrhagic bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	
41	14	9	II	Normal	Acute hemorrhagic bronchitis	Acute hemorrhagic splenitis	Cloudy swelling	Thrombosis of left first sinus; left otitis media
B. Following measles; Streptococcus hemolyticus not isolated (13 cases)								
5	4	7	I a	Normal	Acute purulent bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	
6	6	9	I b	Acute fibrinous pleurisy	Acute purulent bronchitis	Acute diffuse splenitis	Cloudy swelling	
7	..	..	I b	Acute fibrinous pleurisy	Acute purulent bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	
11	..	4	I a	Normal	Acute purulent bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	
12	..	8	I b	R., serofibrinous pleurisy; L., acute fibrinous pleurisy	Acute purulent bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	Erysipelas
13	..	25	II	Normal	Acute catarrhal bronchitis	Acute follicular splenitis	Cloudy swelling	Acute epidemic meningitis
19	7	5	I b	L., acute fibrinous pleurisy	Acute hemorrhagic bronchitis	Acute diffuse splenitis	Acute parenchymatous nephritis	
21	11	4	III	R., acute fibrinous pleurisy	Acute purulent bronchitis	Acute diffuse splenitis	Acute parenchymatous nephritis	
25	11	5	I a	R., acute fibrinous pleurisy	Acute purulent bronchitis	Acute diffuse splenitis	Normal	
26	17	7	II	Double empyema	Acute hemorrhagic bronchitis	Acute diffuse splenitis with hemorrhage	Acute parenchymatous nephritis	
28	6	15	II	Normal	Acute catarrhal bronchitis	Acute diffuse splenitis	Cloudy swelling	Erysipelas, double otitis media
32	16	6	II	R., empyema	Acute hemorrhagic bronchitis	Acute follicular splenitis	Acute parenchymatous nephritis	Lobar pneumonia

obscured. In fact, the lesions established will be a true streptococcic or pneumococcic bronchopneumonia. If, on the other hand, the invading organisms enter the system late in the disease, are few in number, or do not possess marked virulence and invasive powers, they will influence the pathologic process slightly or not at all, and a true measles-bronchopneumonia will be produced. This explanation would readily fit our anatomic findings. I greatly regret that because of certain technical accidents, our microscopic sections have been largely unfit for study; for this reason, only the gross anatomic picture is given.

STREPTOCOCCIC BRONCHOPNEUMONIA

The majority of cases of streptococcic bronchopneumonia were of Type II. The bronchi showed hemorrhagic inflammation. Empyema occurred frequently. The spleen presented the picture of an acute splenitis often with hemorrhages, or a distinct hemorrhagic condition; it was slightly enlarged, having a smooth capsule of a slaty color or dark red. The consistency was flaccid, the cut surface pale grayish brown and often containing irregular dark red hemorrhagic areas; the follicles and trabeculae were indistinct.

Otitis media, mastoiditis, and other complications were frequently present. The mastoiditis was characterized by reddish black discolorization of the bone, which was so necrotic that it could be easily cut with a knife. Subserous hemorrhages, usually small and of pin-point size, were frequently encountered on the pleural, pericardial, renal, cerebral and hepatic surfaces. Similar hemorrhages were found in the mucosa of the renal pelvis, the stomach and the intestine. In a general way, organic changes were more widespread and of greater severity in the streptococcic infections.

BRONCHOPNEUMONIA NOT FOLLOWING MEASLES AND NOT STREPTOCOCCIC

Cases of bronchopneumonia not following measles and not streptococcic occurred usually as a complication of some other disease (Table 2). The lung picture was classified as Type II, but, as the table shows, the bronchial and visceral changes were less pronounced.

LOBAR PNEUMONIA AND COEXISTENT LOBAR AND BRONCHOPNEUMONIA

The eight cases of lobar pneumonia resemble, in every way, those usually encountered. In three, coexisting bronchopneumonia was found, in all of which the pneumococcus was isolated. One pneumonic lung presented an interesting picture. The entire right lung was consolidated; the upper and middle lobe had a grayish red cut surface, granular in appearance, from which pneumococcus cultures were made. The lower lobe possessed a distinctly more reddish appearance, and from this part hemolytic streptococci were isolated. It may be that the streptococcic and pneumococcic inflammation coëxisted, or, what is more likely, the streptococcus process was superadded to the pneumococcic involvement.

EMPYEMA

The necropsies during the past winter showed an unusually high percentage of empyema, this condition being present in 21 of 52 cases. (The term "empyema" is here used to include serofibrinous pleurisy. In the table these two stages of the same process are separated.)

Clinically, a "cold" or "sore throat" frequently preceded the empyema by a few days; then, after exertion, or without discoverable cause, the following syndrome was noted: a chill, which is described as severe and sometimes lasting for an hour followed by a cough, pain in the side, fever and dyspnea. This clinical history, with the finding of dulness in the side often lead to the diagnosis of lobar pneumonia. The roentgen ray and clinical studies showed that the empyema was of unusually rapid occurrence, often developing over night.

Table 3 shows the locations of the empyema, the condition of the lung, the organism isolated, and coexisting inflammation of the peritoneum and pericardium. It is seen that only five cases of measles were complicated by empyema; in ten instances "sore throat" or a "cold" preceded the disease. The organisms found were: hemolytic streptococcus, fourteen; pneumococcus, five; no growth, and undetermined one each. In all cases the fluid obtained at necropsy was distinctly turbid, in most cases frankly purulent. It usually was a thick, yellow and creamy liquid, in which large clumps of fibrin floated. Occasionally a greenish tint was found, and, in the streptococcic cases, a brownish, light coffee color. The quantity varied from 100 to 2,500 c.c.; this variation is in part due to previous aspiration or operation. In nine instances the right, in eight the left, in four both pleural cavities were affected. In the latter, various developmental stages could be observed; the empyema was walled off or pocketed by a tough, fibrinous adhesion between the lung and the lateral chest wall. Interlobar empyema was only once found. Sometimes only one, sometimes several pus pockets were present; a certain amount of free basal empyema usually existed. These cases were of considerable clinical interest since drainage proved difficult and occasionally a large pocket was not reached, while another was perfectly emptied. In all cases of empyema, the pleural surface was almost completely enveloped by a thick coat of yellow, soft exudate averaging from 3 to 10 mm. in thickness, and binding the lung lightly to the chest wall here and there. If the exudative process had existed for some time, organization occurred. The pleural surface then was grayish, and had a somewhat scaly, dry appearance. The exudate was much tougher and adhesion firmer; in the latter cases empyema pockets were found. This would seem to indicate that, other conditions permitting, early operations offer the best chance for complete drainage. The changes in the lung were usually those of bronchopneumonia; lobar pneumonia was found only in one case. The lung on the infected side showed compression varying in degree with the quantity of fluid present. In several instances the lung was no larger than a fist, having then a dry fleshy appearance and a tough meat feel. The cut surface was dark red, airless and dry, the bronchial branches standing out prominently because of the loss of separating tissues. More often than atelectasis of the entire lung, compression of only one lobe was found; this had the same appearance as described above. The uninvolved side showed compensatory inflation, the organ being widely distended and hypercrepitant.

In six cases no inflammatory changes were present in the lungs, and the empyema had to be looked on as primary. The lung tissue was carefully examined in these cases; and while it is conceivable that the existing atelectasis obscures the inflammatory changes, careful study failed to reveal any. Five of these primary empyemas were streptococcic in origin. In the other, no organism was isolated.

ACUTE PERICARDITIS

Ten instances of acute pericarditis were discovered, with one exception, in the serofibrinous or purulent stage. One case was preceded by measles, another by "rheumatism." The hemolytic streptococcus was isolated six, the pneumococcus four times (twice Type II, once Type I, once, type not determined). Lobar pneumonia existed in one of the cases, bronchopneumonia in six, and in three instances the lung did not show any inflammatory processes. In all but one patient the pericardial inflammation was associated with empyema. In one case the pericarditis was looked on as primary, since no inflammatory processes in other organs were found present. In this case hydrothorax and ascites of undetermined origin were found. The findings are grouped together in Table 4.

TABLE 3.—FINDINGS IN EMPYEMA AND SEROFIBRINOUS PLEURITIS

No.	Preceding Disease	Pleurae	Lung	Organism Isolated	Remarks
12	Measles	R., serofibrinous pleurisy L., fibrinous pleurisy	R., bronchopneumonia L., bronchopneumonia	Pneumococcus

62	"Cold"	R., empyema L., empyema	R., bronchopneumonia L., bronchopneumonia	Streptococcus hemolyticus	Acute peritonitis

CHANGES IN THE CARDIOVASCULAR AND THE ABDOMINAL VISCERA

The heart, in the majority of cases of bronchopneumonia and lobar pneumonia, showed right-sided dilatation and cloudy swelling. The aorta, in an unusual percentage of instances, presented atheroma. In forty-two cases, detailed notes concerning the state of the aorta were made. In thirty of these, aortic atheroma was present in the form of elevated, yellow patches or streaks. They were situated mostly in the ascending arch, and to a less extent in the abdominal aorta and other portions of the arch. The thoracic aorta was almost always normal. The atheromatous lesions numbered from a very few to several dozen. They were subintimally located, and varied in consistency from hyaline firmness to definite softening. The coronaries showed distinct involvement in a considerable number of cases. Since the common causes of aortic disease, syphilis and other chronic infections, are not to be elicited in the history or necropsy findings, one is forced to consider the possibility that the present infection is the cause of the intimal changes, which speculation points out that close observation should be made of aortas in these young men coming to necropsy from acute infections. Since our patients are only in the third decade of life, the presence of aortic change is of interest.

The liver usually showed cloudy swelling. The gastro-intestinal tract presented no noteworthy changes.

MENINGITIS

Meningococcic Meningitis.—Five patients came to necropsy. The duration of the disease was 3, 3, 4, 9 and 25 days, respectively. The last patient had a recurrence of infection, since at one time his spinal fluid was clear and sterile. The pathologic picture was similar in all cases. This pia-arachnoid had a loose, edematous structure, and was moderately injected. Fine, yellow lines of perivascular purulent infiltration were seen, especially in the temporoparietal area. A yellow, soft exudate was found chiefly on the base of the brain from the optic chiasm to the cerebellum. The upper surface of the cerebellum showed an especially heavy deposit. In one case practically the entire brain surface was covered, in the other the exudates were largely confined to the temporoparietal lobes. The lateral ventricles contained a turbid fluid in all cases, frank pus in one, and in two instances they were distended to twice their size, forming an internal hydrocephalus. The viscera in all patients showed cloudy swelling, the spleen was slightly follicular, and the lungs in three instances showed areas of bronchopneumonia.

Pneumococcic Meningitis.—This occurred in one instance and was associated with bronchopneumonia. The anatomic picture was similar to that of meningococcic meningitis.

Streptococcic Meningitis.—In all three cases, purulent otitis and mastoiditis was the atrium of the infection.

Parts of the mastoid and petrous bone were bluish black and necrotic. The mastoid cells and internal ear contained greenish pus. The pia-arachnoidal vessels showed greater infection than in meningococcic meningitis. The exudate had a greenish tint, and was more abundant. Punctate, subpial hemorrhages were present. Thrombosis of the right lateral sinus was once seen. The ventricles were overdistended in one instance, and in all cases contained semipurulent fluid. The ependyma was moderately reddened. The visceral changes were more pronounced than those of meningococcic meningitis. Parenchymatous nephritis was the principal lesion noted.

TABLE 4.—FINDINGS IN TEN CASES OF ACUTE PERICARDITIS

No.	Organism Isolated	Condition of Lung	Condition of Pleura
8	Pneumococcus	Lobar pneumonia, R., L.	Acute fibrinous pleuritis, R.
18	Streptococcus hemolyticus	Double bronchopneumonia	Empyema, L.
23	Pneumococcus	Bronchopneumonia, L.	Negative (hydrothorax)
31	Pneumococcus	Negative (compensatory atelectasis)	Negative (hydrothorax)
35	Streptococcus hemolyticus	Bronchopneumonia, R., L.	Empyema, R.
38	Streptococcus hemolyticus	Negative (compensatory atelectasis)	Empyema, L.
42	Pneumococcus	Double bronchopneumonia	Empyema, L.
44	Streptococcus hemolyticus	Bronchopneumonia, L.	Empyema, R.
49	Streptococcus hemolyticus	Negative (atelectasis, L.)	Empyema, L.
57	Streptococcus hemolyticus	Double bronchopneumonia	Empyema, R.

Hemorrhagic Encephalitis.—As has been stated elsewhere, punctate subserous hemorrhages were often observed in streptococcic infections. One case of bronchopneumonia was complicated with a marked hemorrhagic encephalitis. Clinically the patient developed delirium two days after the onset of the bronchopneumonia, and the neck became stiff. Lumbar puncture yielded clear spinal fluid containing a considerable number of polymorphonuclear cells.

The brain showed extensive subpial hemorrhagic extravasations, particularly over the frontal and superior parietal areas. The large veins were greatly congested. In the cut surfaces an unusual number of bleeding points were present. The cortex of the superior portion of the right frontal lobe contained an area of punctate hemorrhages about 2.5 cm. in diameter. In the cortex of the left parietal region a similar hemorrhagic area was found. The ventricles were normal in size, and contained a slightly blood-tinged fluid. The ependyma was normal in size. The internal ear and mastoid cells showed no evidences of inflammation. In microscopic sections, extensive subpial hemorrhages were seen. The vessels in the cortex were greatly distended, and in many instances, packed with polymorphonuclear leukocytes; at many points hemorrhagic extravasations were present in the cortex.

SUMMARY

1. The large majority of deaths were due to infectious diseases.
2. Pneumococcus infection led to a small number of deaths and gave the usual picture.
3. The fatal cases of measles showed the formerly recognized type of measles-bronchopneumonia until a highly virulent and invasive streptococcus changed the character of the pathologic lesions.
4. Empyema arose as secondary to a pneumonitis, and in six cases primarily,
5. The late streptococcus infections have a strong predilection for serous surfaces.
6. Epidemic meningitis was sporadic and of the ordinary form. No cases of spotted fever were seen.

ACUTE STREPTOCOCCIC SEPSIS WITH PURULENT POLYSEROSITIS, SPLENIC TUMOR AND HEMOLYTIC JAUNDICE

PRELIMINARY NOTE

Since the writing of this report, streptococcus infections seem to have taken on a new and highly virulent form. Four postmeasles cases came to necropsy in the week of April 28, 1918. All showed the following anatomic picture: icterus, acute purulent pleuritis, pericarditis, and peritonitis, acute splenic tumor, and multiple subserous hemorrhages.

The lungs contained a few patches of bronchopneumonia. Pure cultures of hemolytic streptococcus were obtained from the heart's blood and the exudate in the pleurae, pericardial and peritoneal cavities.

The findings appear to point to an increase in the invasive powers of the streptococci, probably because of passage through a large number of hosts. A further report will be made.

Effect of Diets on Reproduction.—In a preliminary report (*Science,* March 1, 1918), J. R. Slonaker and T. A. Card of the Department of Physiology of Stanford University summarize their findings on the effects of omnivorous and vegetarian diets on reproduction in the albino rat. The number of pairs constantly under observation was forty, with an equal number as controls, on the same vegetarian diet as the first class, with the addition of some form of animal food. The conclusions so far reached were: The vegetarians were smaller, had less vigor, were less active, had rougher hair and a tendency to sore eyes, while the other group were the reverse in these respects. The earliest ages at which young were born to the omnivorous group was 90 days, while for the vegetarian group it was 119 days, showing that the age of sexual maturity for the former group was 59 days and for the other group 98 days. The average duration of reproductive activity in the omnivorous group was 161 days and for the vegetarian group 111 days, showing that the restricted diet not only delayed the period of reproductive activity, but also shortened it. Vegetarian pairs when they ceased to reproduce were separated and new healthy omnivorous rats mated with them. All these new matings failed to reproduce. The conclusion is that the vegetarian diet produces sterility in both sexes. Only two or three generations of the vegetarian rats could be observed before the line became extinct, forcing the conclusion that the vegetarian diet not only reduces the vitality, the growth and the ability to reproduce, but also tends to the extermination of the race.

RECONSTRUCTION AND REHABILITATION OF DISABLED SOLDIERS

REPORT OF THE SECOND MEETING OF THE SECTION ON MISCELLANEOUS TOPICS, HELD IN THE AUDITORIUM THEATER, THURSDAY, JUNE 13*

The meeting was called to order by Lieut.-Col. Harry E. Mock.

Chairman Mock said: Canada has sent two of her most influential men in the work of reclaiming her disabled soldiers to talk to the American Medical Association and to the people of Chicago. The first, Major John S. Todd, Canada, has seen service in France and is now giving his time and service to the disabled soldiers of Canada.

The Reconstruction of the Canadian Crippled Soldiers and Results

Major John C. Todd said: This meeting is a good thing because our success in this war is going to depend on that which each individual of us does, and success in the war is going to be won no less overseas than right here. In order that we may do what is right it is necessary that we should be correctly informed. It is for this reason that it is a good thing that medical men especially are informing themselves of the right thing to do for disabled sailors and soldiers. Men and women are prone to believe what doctors tell them. If the doctors of this country know the right thing and go about consistently and steadily repeating it, it will not be long before an accurate public opinion is general, constant, fixed, throughout the country. Physicians especially must make Americans understand what must be done by disabled sailors and soldiers and for disabled sailors and soldiers when their war service is at an end. We are all full of sympathy toward the disabled man that comes back, but just as affection for children may be a means of doing injury to a child, so may our sympathy toward disabled men be a means of doing an injury to them.

An English officer, discharged as disabled and wounded after four years of service, complained that he found it difficult to make up his mind concerning the next meal. A civilian is accustomed to order his meals, to do everything for himself. He goes into the army. He serves for four years. During that four years everything is done for him. His meals are ordered. The hour when he should go to his meals is decided for him. What he is to eat at his meals is decided. Suddenly he is wounded, no longer fit to be a soldier. He is turned out in the world and has to unlearn that which has been taught to him with pain and distress. You must help him to unlearn. It would be bad for that man if he were given a holiday for one year without any instruction and preparation for civilian life which is to follow. It would be bad for the country.

How are men to be educated so that they may return to civilian life? The first thing is that their disabilities must be reduced to their lowest measure by all that the wisdom of medicine and surgery can do for them. They must have their disabilities made as small as they may be by the provision of appropriate artificial appliances. The men must be made fit for employment. They must be taught employments. Most of them—80 per cent. of them—will be able to go back to full time occupations and compete with normal people, but there will be some who cannot, and even for those who can compete it will be difficult to find employment. The government must provide means for giving employment to disabled men.

A pension is not a gift. It is not something that is given to disabled men for what they have done. It is a debt paid to them in order to make up to them that measure of capacity which they have lost by reason of their service. (Applause.) You had one fault in your pension law. You should put one authority in charge of your pension legislation, make him a supreme court judge, if you will, and then let no authority interfere with his decisions. That is what has been done in Canada. I am one of three pension commissioners who have the responsibility to disabled men and to the public of Canada of justly distributing pensions, and there is no authority in Canada outside of the united will of our legislature and senate who has the power to alter our decisions.

[The Hart House Training School film was then shown, and a film illustrating "Artificial Limbs in the Making," with comment by Major Todd.]

It is very necessary that the government responsible for distributing artificial limbs to disabled men should have types of limbs made by itself. The government is responsible for keeping those limbs in repair or replacing them. If it were dependent on limbs bought in commerce there would certainly be competition among individual manufacturers, and there would not be any certainty that disabled men would get absolutely the best limb which knowledge can give to them. The Canadian government therefore has established for itself types of limbs. It distributes these to men who need them and it keeps them in repair and replaces them when they are worn out.

Because there will be large numbers of men in Canada using artificial limbs and requiring repairs to them constantly during the next generation, it has been found necessary for the government to look toward training men who will be able to repair those limbs. It will be a nuisance for a man out on a farm on the prairie to send his leg in, perhaps a couple of thousand miles, to a large city in order to have it repaired. The government is training disabled men, largely in the government limb factory, in order that they may go to their communities and set up small repair shops.

These are the general principles on which the rehabilitation of disabled men must proceed. The precise manner in which these principles will apply in the United States must depend on the nature of your own problems. There are one or two things, however, which experience in France, Great Britain, Italy and Canada can teach. One of those things is this: it is necessary to place the whole business under the jurisdiction of one central administrative power.

Lieut.-Col. James Bordley, Jr., vice chairman, then took the chair.

The Conservation and Reclamation of the Industrial Soldiers—A War Measure

Lieut.-Col. Harry E. Mock said: I am here to speak to you about another soldier, the industrial soldier, the soldier of the second line of defense, the man who belongs to that great industrial army which is just as essential to the winning of this war as is the military army, and the man who becomes disabled and wounded without the glorification that comes from such wounds by securing them on the battlefield. In England and France and that portion of Belgium that is left, and the other countries, they have done everything to increase the efficiency of the industrial army in order to speed up production for the purpose of winning the war. If this is good for war time, if these things increase production to win this war, why are they not good for peace times? They answer it themselves by saying they are. Never again will the old order of things exist after this war. Therefore it behooves this country to look forward to that period of social democracy when we are bound to have exactly the same conditions here. As the first country standing out as the land of freedom, we must be the leaders in this national, social democracy; but above that the immediate need is the need of winning the war. I am going to switch now to four lantern slides which I believe will drive home the idea I want to convey better than anything else, namely, that today the need of man power to win this war must compel us to form some means of conserving our industrial army and reclaiming the disabled from that industrial army.

This is a map showing our two armies; the first line of defense is the military army, the second line of defense is the industrial army. Two years ago at Detroit there was born a new organization, of men who were practicing industrial medicine and surgery, the keynote of which is the prevention of disease and accident among the industrial employees of this country.

This is the dream [referring to another picture on the screen] of those men, human conservation, the firm foundation of production. It is done by disease prevention, by accident prevention, plant sanitation, home sanitation, physical selection for jobs, adequate medical and surgical care for those disabled, good wages, good food, recreation and education. As a result, we get the maximum production, by experienced, intelligent, loyal employees.

---

* Report of special meetings held as a part of the scientific assembly at the Sixty-Ninth Annual Session of the American Medical Association.

This speaks for itself [referring to another picture]. Here are the by-products from the military army. If we have 2,000,000 soldiers in Europe, and 200,000 are disabled in a year by wounds and by disease, for that is what the figures from the other countries show, 50,000 must be physically reconstructed, and 20,000 must be vocationally retrained and otherwise reclaimed. Here is the industrial army of 30,000,000, soldiers 3,000,000, disabled every year by accidents and by disease, 800,000 that should be physically reconstructed, and 200,000 that should be vocationally retrained and otherwise reclaimed. Are we doing it? Cut out the human scrap heap, salvage the disabled, conserve human life and human energy.

The Selection of New Occupations for Disabled

(Mr. T. B. Kidner read a paper on this subject which will appear in a later issue.)

Lieut.-Col. Mock took the chair. He said: If the people of this country could only understand how much Mr. T. B. Kidner of Canada has given to us to help us develop our plans for the care and the reclaiming of our disabled soldiers, you would come to love him just as those of us down at Washington have who have been working with him lately. When the war came Mr. Douglas C. McMurtrie dreamed great things. He went to the Red Cross and established through their help the American Red Cross Institute for cripples in New York. After he got that going he dreamed greater dreams in establishing Red Cross institutes for cripples elsewhere. They are using the civilian cripple, studying his rehabilitation, the reclaiming of the civilian cripple, with a view of developing the best means of reclaiming the crippled soldier when we have him with us.

The Results of Rehabilitation in Foreign Countries

Mr. Douglas C. McMurtrie said: When the United States entered the war the American Red Cross looked around to see what its responsibilities would be in the field of rehabilitation, and as it thought that government plans might move a little more slowly than unofficial activities, it decided to start one experimental school of reeducation. This school was established between six and nine months ago in New York City and is known as the Red Cross Institute for Crippled and Disabled Men. Its first and most important activity is its educational department, and in this department there have already been started training classes in oxy-acetylene welding, in the making of artificial limbs, in printing, in mechanical drafting and in jewelry work. The institute also maintains an employment department which has been of considerable service during the last six months. During that time it has placed 600 seriously disabled men who could not have been placed in employment through the ordinary channels. It has also carried on a research department which it is felt has been of some use. One of our first duties was to proceed to the collection of a library and the publication of a series of studies that would bring the matter quickly and easily to the attention of the people who contemplated going into similar work. As a result of the preparation, that school could without any difficulty receive tomorrow morning 100 additional pupils and be entirely ready for them. For some time there have been carried on here some excellent training classes in preparing women to do the ward occupations and the earlier work with the men who will later be vocational cases. Through the generosity of one of the citizens of Chicago, it is also probable that there will be established here in this city before long a Red Cross institute similar to the one which I have just described to you in New York. I will interrupt my remarks here to show you a film of one of the French schools of reeducation. This film illustrates the work of the school at Montpellier, which accommodates hundreds of French war cripples. At this school they are taught various trades which have been found successful in that country.

Motor mechanics is one of the most popular trades for disabled men, and our Canadian friends tell us that practically every disabled soldier wants to take up motor mechanics. The first job of the vocational officer is to persuade him not to take that course up and to find out what he is really best fitted for. However, for the men for whom it is a wise choice it offers very good employment. In choosing trades and employments we have to look to the conditions after the war. The British minister of pensions has sent out instructions that no disabled soldiers are to be trained as automobile drivers. The reason for that is that in the present war all transportation is being done by motor trucks, and in consequence a vast army of men have been trained as chauffeurs and they have had the most remarkable experience that any one could get. After the war is over those men will come back to civilian labor and they would compete unduly with the disabled men who might be trained.

All these things may perhaps seem obvious to us, but they are certainly not obvious to the public as a whole. One of the main purposes of this meeting was to come to this audience and ask for their help in putting this principle across, in going to the public and explaining the matter and securing constructive rather than destructive cooperation. In this way we can help our disabled men to the honor of self support rather than to the ignominy of dependence. We are counting on you.

Chairman Mock said: Since last October we have been working in Washington along two lines; one, that these men could be rehabilitated absolutely as a military proposition, and the other, that we needed the greatest possible cooperation between the military and the civilian forces to put these men back as useful units of society as civilians once more.

Mr. C. A. Prosser, of the federal Board for Vocational Education, was to be present and address you today, but at the last moment found he could not come. In his place came Mr. James P. Monroe, a business man of Boston and the vice chairman of the Board for Vocational Education.

The Federal Board for Vocational Education

Mr. James P. Monroe said: The federal Board for Vocational Education is made up of three members of the Cabinet, the Commissioner of Education and three lay members. We have been making a study of this subject both from the side of the industrial cripple and from the side of the war cripple ever since we were organized last July, and we have had the help not only of the Surgeon-General's Department but we have had the help of the American Red Cross through the admirable Red Cross institute in New York, to which Mr. McMurtrie has referred, and also inconceivably valuable help from the Canadian government and through such men as have appeared before you today, representing Canada. The bill which passed unanimously, when signed by the President, is the basis for action by the federal Board for Vocational Education.

The subject is, What is to become of the reconstructed soldier in civil life? We used to regard the returned crippled soldier as a pensioner. Under this new legislation and the attitude of the Surgeon-General's Office we purpose to make him a man. He used to be an object of charity. We purpose to make him an object of pride. We used to throw him on the scrap heap. We now purpose to make him one of the pillars of economic society. There is every reason and every tendency for the soldier when he finds himself more or less crippled by the war or by disease to fall into an attitude of despair and hopelessness. There will be every tendency for him to regard himself as a hero and to accept the propping up which society will be willing to give him. There will be every tendency on the part of well meaning persons to coddle him and make him soft. There is danger if he is kept too long in the process of physical rehabilitation that he will become hospitalized, and there is not a more hopeless object than a hospitalized man, or woman.

Finally, there is the natural timidity of any man to take the first plunge back into industry. All those things have got to be overcome jointly by the Surgeon-General's Department and by the federal Board of Vocational Education, by the Red Cross and by all the other splendid agencies. This thing has got to be handled not on the basis of sentimentality, but on the basis of common sense. There will be the skepticism of employers, who cannot imagine a crippled man being of much use in industry. There will be the suspicion of labor, which will feel that we are going to exploit the man, on the one hand, or else that we are going to crowd our industries with cheap labor which is cheap because it is crippled. There will be, and this is one of the most serious things, there will be some day in the future hard times, when all these occupations that we may have temporarily found for the crippled man will fall like a house of cards under economic pressure, and the tendency will be to forget the debt that we owe these men and to throw them out as the first to be scrapped in industry. All those things have got to be overcome by understanding and by education of the public. The education is an entirely new field, and we have got to educate the schools and the colleges, and especially the industries themselves all over the country, to help us in giving the right sort of vocational reeducation to these men. From the very first minute that you get hold of that man when he comes back from No Man's Land he must be encouraged to develop his initiative, and that initiative must be based first on hope, on the impression that of course he is going to have a little handicap, but on the whole he will be just as good, if not a little better fellow than he was before. It must be based on a knowledge of what is open to that man in civilian and industrial life. It must be based finally on setting before that man from the earliest possible moment, from the moment that he comes out of the ether, if possible, the idea of his working toward a definite industrial, economic and social goal.

I agree absolutely with what was said this morning, that there must be every possible opportunity for recreation and therefore there must be ample grounds; but we must not forget that while recreation is absolutely essential as a therapeutic measure, purposeful work also is an absolute essential as a therapeutic measure, and you cannot get real work that means something to the man unless you can bring him into close contact with industries. For that purpose you must have some place where there is a great variety of industries. The next essential thing, it seems to me, is that this crippled man at the very earliest date should be gotten back, as far as possible, to his old environment. In the first place, because there is no better way, in order to restore that man's normality, than to make him feel that he is just as good a man as he was before by bringing him back among his old associates and in his old vicinity. In the second place, it is necessary to enlist the social backing of the people of his home town. That is, I believe, one of the most essential things in this whole business. Therefore, I cannot see any way out of this thing except to have a great number of small restoration hospitals scattered all over the country so that the man at the earliest possible time shall be brought back into his own vicinity, and this widening out into the industries of that vicinity takes place from what you may call a local hospital.

All this work, however, will be futile unless we organize an efficient follow-up system. The men cannot be trained and turned over into an industry and then let go. We have got to have some system of follow-up to see that he really fits into that industry, to see that he does not get discouraged, to see that he is not exploited, to see that he does not, as there will be tremendous tendency among these men to do, become a rolling stone, trying first this thing and then that thing, seeking here and seeking there and each time falling down to a lower economic level. Finally, we have got to organize social agencies, such as the Red Cross, such as the local agencies, such as all sorts of things that will occur to you, to stand behind the man on the social side, to stimulate him and keep him up with that ambition which is essential, to teach him thrift, for this man is going to have a good deal of money from the government besides that which he earns, and he has got to be taught how to make that money of the most value to him. These social agencies must look after the family conditions to be sure that they are not meddling with his ambition, to be sure that they are not weighing him down with all kinds of conditions that are unnecessary, and finally to do everything they can to hold out the glad hand and to bring that man back into the normal social and economic life. That, after all, is the problem to make this man normal.

Chairman Mock said: We were to have Mr. W. Frank Pearsons, director of the Civilian Relief Division, American Red Cross. Mr. Pearsons has just returned from France and could not come on to Chicago. We have from that same division Mr. Curtis E. Lakeman.

Social and Economic Supervision of the Disabled Soldier

Mr. Curtis E. Lakeman said: The American Red Cross is carrying out, in this field of reconstruction, its characteristic function of supplementing the work of the governmental authorities. Aside from research, experimental and educational work in special institutes, there are two ways in which the Red Cross is peculiarly qualified and obligated to help.

In the first place, it can influence the family to give strong moral support to the soldier under treatment and in training, just as much as to the soldier at the front.

In the second place, it can bring to the man himself the friendly service of a big brother during the whole course of his effort to fit himself for a new occupation, and until he again stands firmly on his own feet in civil life.

The Red Cross is prepared for this duty because it is already caring for the families of soldiers and sailors, supporting their fighting morale by removing causes of worry about home conditions. This is being done so unostentatiously that little is known to the public of this Red Cross activity. There have already been organized throughout the United States more than 3,000 local committees known as home service sections. These are charged with the responsibility of maintaining American standards of family life among the dependents of enlisted men whenever the need of any form of assistance is made known.

It is a misconception to think of these committees as made up of women alone; least of all of those good-hearted but mistaken women whose oversentimental activities in the entertainment of returned soldiers constitute a menace to their true welfare. On the contrary, the type of trained women who lead in Red Cross Home Service gives a strong safeguard against this very danger. But also it is a first principle to place on each home service committee a doctor, a lawyer, a banker and a business man—leading local citizens who are qualified to give to dependents of soldiers practical advice as to their rights and duties under the War Risk Insurance Law, help them adjust mortgages, obtain good medical care, in a word, provide every form of helpfulness which will maintain the solidarity of the family. Here in Chicago over a hundred men are already enlisted as trained volunteers in the local home service section.

To these Red Cross committees in every city and county of the United States the government will be able to turn, in confidence that the follow-up of the disabled soldier is in competent and sympathetic hands. Whenever the man goes to a distant city for industrial training or to take up a new vocation, an experienced older brother will be ready and anxious to stand by him and talk over those personal problems which he may not wish to discuss with a government official, no matter how well equipped and conscientious the latter may be.

It is these committees, made up both of practical men of affairs and trained sympathetic women, that will bring a powerful influence to bear on the soldier through his family. The support of the family must be given the soldier at every stage of his hospital treatment, vocational training and early efforts to make his way in industry. The returned soldier has one more battle to fight for his country and his own future. Under the wise plan of the national government, the man must himself make the mental and physical effort to prepare for a new occupation, and a future of self support. On the education of the man's own will, not on military or economic compulsion, depends the success of the whole system. It is for the disabled soldier himself to decide whether he shall contribute to the economic and social stability of his family and his country, or shall degenerate into a mere pensioner or even a street beggar. There is not time, nor is it necessary to do more than suggest the enormous influence which the family can exert on that momentous decision. In advising the family what it can and should do to help the man, the Red Cross has the machinery already set up in its home service organization, and eagerly awaits every opportunity to discharge in this way its share of responsibility for the reconstruction of the disabled soldier.

Michael Dowling

The Michael Dowling film was shown. At the close of the showing of the film Mr. Dowling walked on the platform.

Mr. Michael Dowling said: *Ladies and Gentlemen:* I think there is danger of too much being attempted and making it too easy for the men who come back with a leg gone or an arm gone. Now, an arm being gone is a mere bagatelle, two arms don't amount to anything, and I can assure you from personal experience that it doesn't mean anything to have both legs and both hands gone. There is just as much fun in living. I used to be able to drive a team of horses just as well as anybody and used my right arm for the usual purpose in courting. I can still handle an automobile, although I think an automobile is an unnecessary nuisance to a couple who wish to get married. What the so-called cripple needs is not charity but a chance. The fight that wants to be put up at this time is not between money and opportunity or the loss of legs or the loss of arms or eyes or other members of the body, but this is a fight between General Gorgas and general despondency. Every community and every family ought to see to it that every other member of the family pays no attention to a hunchback, never looks at a man with clubfoot as he walks down the street, especially never looks at his deformity, and never looks at a man with a peg leg or with an empty coat sleeve. It should be taught in the schools. It should be preached from the pulpits.

PROCEEDINGS OF THE CHICAGO SESSION

THE SIXTY-NINTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION,
HELD AT CHICAGO, JUNE 10-14, 1918

MINUTES OF THE SECTIONS

SECTION ON PRACTICE OF MEDICINE

WEDNESDAY, JUNE 12—MORNING

The section was called to order at 9:30 by the chairman, Dr. Lawrence Litchfield, Pittsburgh.

The secretary, Dr. James S. McLester, Birmingham, Ala., read excerpts from the by-laws regarding discussion of papers.

The chairman asked Dr. W. L. Bierring, Des Moines, and Dr. Charles F. Hoover, Cleveland, to take the places on the executive committee, for this meeting, of Drs. Thomas McCrae, Philadelphia, and Roger S. Norris, Cincinnati, who were unable to be present.

The chairman named for the nominating committee Drs. Horace D. Arnold, Boston; Willard J. Stone, Toledo, and Thomas D. Coleman, Augusta, Ga.

The chairman, Dr. Lawrence Litchfield, Pittsburgh, read the chairman's address, entitled "Glucose Intravenously as a Therapeutic Agent." No discussion.

Dr. Edward C. Rosenow, Rochester, Minn., read a paper on "Further Studies in the Treatment of Acute Poliomyelitis with Immune Horse Serum." Discussed by Drs. P. S. Roy, Washington, D. C., and Edward C. Rosenow, Rochester, Minn.

Dr. Henry A. Christian, Boston, read a paper on "Pulmonary Compression Signs Associated with Fibrinous Pericarditis." Discussed by Drs. William H. Robey, Jr., Boston; H. D. Power, San Francisco; Charles G. Jennings, Detroit; George D. Head, Minneapolis; Lawrence Litchfield, Pittsburgh; Granville N. Ryan, Des Moines, Iowa, and Henry A. Christian, Boston.

Dr. Sydney R. Miller, Baltimore, read a paper on "Ulceration of the Soft Palate Resembling Syphilitic Perforating Ulcer Due to Fusiform Bacilli and Spirillae (Vincent's Angina)." Discussed by Drs. W. H. Marshall, Camp Grant, Rockford, Ill.; Frank J. Sladen, Detroit; Henry A. Christian, Boston, and Sydney R. Miller, Baltimore.

WEDNESDAY, JUNE 12—AFTERNOON

Dr. William W. Herrick, New York, read a paper on "The Early Diagnosis and Intravenous Serum Treatment of Epidemic Cerebrospinal Meningitis." Discussed by Drs. J. B. Guthrie, New Orleans; W. L. Bierring, Des Moines, Iowa; Powhatan S. Schenck, Norfolk, Va.; F. F. Russell, Washington, D. C.; Walter W. Hamburger, Chicago, and William W. Herrick, New York.

Dr. William N. Bispham, Fort Riley, Kan., read a paper on "The Training of the Medical Officers in the Army." No discussion.

Dr. William H. Robey, Jr., Boston, read a paper on "Neurocirculatory Asthenia." Discussed by Sir James Mackenzie, London, England, and Drs. Louis M. Warfield, Milwaukee; B. S. Oppenheimer, New York; Abraham Jacobi, New York, and William H. Robey, Jr., Boston.

Dr. Joseph H. Pratt, Boston, read a paper on "Newer Aspects of Digitalis Therapy." Discussed by Sir James Mackenzie, London, England.

The following officers were elected: chairman, Dr. Walter L. Bierring, Des Moines, Iowa; vice chairman, Dr. Charles G. Jennings, Detroit; secretary, Dr. James S. McLester, Birmingham, Ala.; delegate, Dr. George D. Head, Minneapolis.

Dr. Horace D. Arnold, Boston, read a paper on "War and Medical Education." No discussion.

FRIDAY, JUNE 14—MORNING

The following papers were read as a symposium on "Pneumonia":

Dr. Arthur A. Small, Chicago: "Unique Findings Gathered from the Observation of Eleven Hundred Cases of Pneumonia in a Base Hospital."

Dr. Joseph L. Miller, Chicago: "An Epidemic of Streptococcus Pneumonia and Empyema at Camp Dodge."

Dr. Willard J. Stone, Toledo, Ohio: "A Clinical Study of Eight Hundred Cases of Pneumonia."

Dr. James G. Cumming, Ann Arbor, Mich.: "Streptococcus Pneumonia."

Dr. William G. MacCallum, Baltimore: "The Pathology of the Pneumonia of the Army Camp."

Dr. Ralph A. Kinsella, St. Louis: "Practical Consideration of Epidemiology Drawn from a Classification of Streptococci."

These papers were discussed by Drs. William H. Welch, Baltimore; Lawrence Litchfield, Pittsburgh; F. F. Russell, Washington, D. C.; Rufus I. Cole, New York; Walter P. Bliss, New York; C. Hugh McKenna, Chicago; George F. Dick, Chicago, and Edward C. Rosenow, Rochester, Minn.

FRIDAY, JUNE 14—AFTERNOON

Dr. Clyde L. Cummer, Cleveland, read a paper on "Later Results of the Intraspinal Treatment of Cerebrospinal Syphilis, Based on Four Years' Observation." Discussed by Dr. John A. Fordyce, New York.

Dr. George H. Lathrope, Morristown, N. J., read a paper on "Relation of Mastoiditis to Acute Infectious Conditions." Discussed by Drs. John B. Potts, Omaha; Arthur A. Small, Chicago; M. E. Scott, Adel, Iowa; Abraham Zingher, New York, and George H. Lathrope, Morristown, N. J.

Dr. Llewellyn Sale, St. Louis, read a paper on "A Study of Diaphragmatic Movements in Acute Abdominal Inflammations." Discussed by Drs. J. B. Guthrie, New Orleans; F. M. Pottenger, Monrovia, Calif.; M. E. Scott, Adel, Iowa; H. N. McDonald, Minneapolis, and Llewellyn Sale, St. Louis.

The paper of Dr. Joseph A. Capps, Chicago, on "The Control of Cross Infections by Masking of Patients," was then read. Discussed by Drs. James S. McLester, Birmingham, Ala.; John Alden Lichty, Pittsburgh; H. P. Greeley, Madison, Wis.; Albert R. Trapp, Springfield, Ill.; Charles H. Lovewell, Chicago; Edward F. Wells, Chicago, and Granville N. Ryan, Des Moines.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

WEDNESDAY, JUNE 12—MORNING

The meeting was called to order at 9:24 by the chairman, Dr. E. Starr Judd, Rochester, Minn.

Dr. Truman W. Brophy, Chicago, read a paper on "Congenital Cleft Palate and Harelip." Discussed by Drs. A. J. Ochsner, Chicago; Arbuthnot Lane, London, England; Charles H. Mayo, Rochester, Minn.; John B. Roberts, Philadelphia, and Truman W. Brophy, Chicago.

The following papers were read as a symposium on "The Thyroid":

Dr. Charles H. Mayo, Rochester, Minn.: "The Principles of Thyroid Surgery."

Dr. Donald Guthrie, Sayre, Pa.: "Temporary Loss of Voice Following Thyroidectomy."

Dr. Edward G. Jones, Atlanta, Ga.: "Goiter in the Southeast."

These three papers were discussed by Drs. Charles N. Dowd, New York; Arbuthnot Lane, London, England; Miles F. Porter, Fort Wayne, Ind.; Rollo C. Dugan, Ottawa, Kan.;

H. J. Stewart, Oak Park, Ill.; J. W. McDonald, Chicago; C. H. Magee, Burlington, Iowa; Edwin P. Sloan, Bloomington, Ill.; John W. Long, Greensboro, N. C.; C. H. Mayo, Rochester, Minn.; Donald Guthrie, Sayre, Pa., and Edward G. Jones, Atlanta, Ga.

Dr. Willy Meyer, New York, read a paper on "Glycophilia." Discussed by Drs. W. S. Schrayer, Chicago, and Willy Meyer, New York.

Dr. Ralph E. Morter, Milwaukee, read a paper on "End-Results in Hodgkin's Diseases." Discussed by Vincent A. Lapenta, Indianapolis; William C. MacCarthy, Rochester, Minn., and Ralph E. Morter, Milwaukee.

Wednesday, June 12—Afternoon

The meeting was called to order at 2:15 by the chairman, Dr. E. Starr Judd, Rochester, Minn.

Dr. Judd read the chairman's address, entitled "The Surgery of the Gallbladder and Biliary Ducts." No discussion.

Dr. J. Shelton Horsley, Richmond, Va., read a paper on "Reconstruction of the Common Duct from the Experimental Standpoint."

Dr. LeGrand Guerry, Columbia, S. C., read a paper on "Clinical Report on Reconstruction of the Common and Hepatic Ducts."

These two papers were discussed by Drs. Arthur G. Sullivan, Madison, Wis.; C. N. Davis, Chicago; L. L. McArthur, Chicago; H. O. Marcy, Boston; I. J. Straus, Chicago, and J. Shelton Horsley, Richmond, Va.

Dr. J. Earl Else, Portland, Ore., read a paper on "Rôle of the Cystic Duct in Recurring Cholecystitis." No discussion.

Dr. Edward W. Archibald, Montreal, read a paper on "The Ultimate Results in Cases of Chronic and Subacute Pancreatitis." Discussed by Drs. W. D. Haggard, Nashville, Tenn.; E. Starr Judd, Rochester, Minn.; J. Earl Else, Portland, Ore.; Rollo C. Dugan, Ottawa, Kan., and Edward W. Archibald, Montreal.

Friday, June 14—Morning

The meeting was called to order at 9:30 by the chairman, Dr. E. Starr Judd, Rochester, Minn.

Dr. Hermann B. Gessner, New Orleans, read a paper on "The Therapeutics of Tetanus." Discussed by Samuel J. Meltzer, New York; A. J. Ochsner, Chicago; W. Estell Lee, Philadelphia; Carl J. Holman, Mankato, Minn.; Clark W. Brooks, Detroit, and Hermann B. Gessner, New Orleans.

The following officers were elected: chairman, Dr. John T. Bottomley, Boston; vice chairman, Dr. LeGrand Guerry, Columbia, S. C.; secretary, Dr. Eugene H. Pool, New York; acting secretary, Dr. George P. Müller, Philadelphia; delegate, Dr. Jabez N. Jackson, Kansas City, Mo.; alternate, Dr. Donald Guthrie, Sayre, Pa.

Dr. W. Estell Lee, Philadelphia, Pa., read a paper on "The Use of Dichloramin-T and Other Antiseptics in War Surgery." Discussed by Drs. Edward H. Ochsner, Chicago; Fenton B. Turck, New York, and Lee W. Estell, Philadelphia.

Dr. Frank G. Nifong, Columbia, Mo., read a paper on "The Hodgen Extension Suspension Splint and Its Exemplification in Both Civil and War Surgery." Discussed by Drs. H. D. Wood, Fayetteville, Ark.; Daniel N. Eisendrath, Chicago; F. Reder, St. Louis; C. W. More, Eveleth, Minn.; E. M. Sanders, Nashville, Tenn., and Frank G. Nifong, Columbia, Mo.

Dr. Howard W. Haggard, New Haven, Conn., read a paper on "The Fall of the Alkaline Reserve Under Surgical Conditions: Its Effects and Prevention." Discussed by Dr. Fenton B. Turck, New York, and Howard W. Haggard, New Haven, Conn.

Friday, June 14—Afternoon

The meeting was called to order at 2:30 by the chairman.

Dr. George N. Kreider, Springfield, Ill., read a paper on "Gastroptosis: Its Cause, Prevention and Cure, with Special Reference to the Duret-Rovsing Operation." Discussed by Drs. Carl E. Black, Jacksonville, Ill.; George P. Müller, Philadelphia, and George N. Kreider, Springfield, Ill.

Dr. Arthur C. Strachauer, Minneapolis, read a paper on "A New Principle in the Surgical Treatment of Brain Tumors." Discussed by Dr. L. L. McArthur, Chicago, and Arthur C. Strachauer, Minneapolis.

Dr. Walter E. Sistrunk, Jr., Rochester, Minn., read a paper on "Kondoléon's Operation." Discussed by Drs. Hubert A. Royster, Raleigh, N. C.; H. B. Gessner, New Orleans; H. R. Decker, Pittsburgh, and Walter E. Sistrunk, Jr., Rochester, Minn.

SECTION ON OBSTETRICS, GYNECOLOGY AND ABDOMINAL SURGERY

Wednesday, June 12—Morning

The section was called to order at 9:30 by the chairman, Dr. Brooke M. Anspach, Philadelphia.

Dr. Anspach read the chairman's address, entitled "Enterostomy and Enterocolostomy in the Treatment of Intestinal Obstruction Following Pelvic Operations."

Dr. Anspach, in the absence of the members of the Executive Committee, appointed temporarily on this committee Drs. C. Jeff Miller, New Orleans; E. E. Montgomery, Philadelphia, and W. P. Manton, Detroit.

Dr. Alfred A. Strauss, Chicago, read a paper on "The Clinical Observations and Results of the Newer Methods of Observations in Congenital Pyloric Stenosis and Gastric and Duodenal Ulcers."

Dr. William D. Haggard, Nashville, read a paper on "Hypertrophic Pyloric Stenosis in Infancy."

These papers were discussed by Drs. Frank X. Walls, Chicago; Weller Van Hook, Chicago; I. A. Abt., Chicago; John W. Keefe, Providence, R. I.; Peter B. Salatich, New Orleans; Alfred A. Strauss, Chicago and William D. Haggard, Nashville.

Dr. Daniel N. Eisendrath, Chicago, read a paper on "The Relation of Anomalies of the Bile Ducts and Blood Vessels to Accidents in Biliary Surgery." Discussed by Drs. William D. Haggard, Nashville, Tenn.; E. E. Montgomery, Philadelphia; J. A. Attridge, Port Huron, Mich., and Daniel N. Eisendrath, Chicago.

Dr. Leigh F. Watson, Chicago, read a paper on "Goiter in Pregnancy." Discussed by Drs. James W. Markoe, New York; Charles H. Mayo, Rochester, Minn., and Leigh F. Watson, Chicago.

Dr. William J. Mayo, Rochester, Minn., contributed a paper on "Secondary Tuberculous Peritonitis." Discussed by Drs. Robert T. Morris, New York; C. A. L. Reed, Cincinnati; Daniel N. Eisendrath, Chicago; Horace G. Wetherill, Denver, and Charles H. Mayo, Rochester, Minn.

Dr. J. Riddle Goffe, New York, read a paper on "Abdominal Visceropexy: An Original Method, with a Report of Cases." Discussed by Drs. C. A. L. Reed, Cincinnati; Nathan Rosewater, Cleveland; William T. Reynolds, Kansas City, Mo.; A. H. Aaron, Buffalo, and J. Riddle Goffe, New York.

Wednesday, June 12—Afternoon

Dr. Ira L. Hill, New York, read a paper on "Extending the Care of Pregnancy." Discussed by Drs. Wilmer Krusen, Philadelphia; J. H. Carstens, Detroit; Otto J. Stein, Chicago, and Ira L. Hill, New York.

Dr. Paul Titus, Pittsburgh, read a paper on "Uterine Inertia; Summary of a Series of Cases." Discussed by Drs. Rudolph W. Holmes, Chicago, and Paul Titus, Pittsburgh.

Dr. George W. Kosmak, New York, read a paper on "The Use and Abuse of Pituitary Solution." Discussed by Drs. J. B. De Lee, Chicago; J. L. Bubis, Cleveland; Jennings C. Litzenberg, Minneapolis; C. S. Bacon, Chicago, and W. P. Manton, Detroit.

Dr. John Young Brown, St. Louis, read a paper on "Pus in the Female Pelvis: A Surgical Retrospect."

Dr. Harry P. Ritchie, St. Paul, read a paper on "Rectal Section for Pelvic Abscess."

These two papers were discussed by Drs. J. H. Carstens, Detroit; E. E. Montgomery, Philadelphia; G. N. Thomas, El Paso, Texas; James Mather Pfeiffenberger, Alton, Ill.; Horace G. Wetherill, Denver; Peter B. Salatich, New Orleans; Robert T. Morris, New York; John Young Brown, St. Louis, and Harry P. Ritchie, St. Paul.

Dr. W. P. Manton, Detroit, read a paper on "Parotitis Following Induced Abortion in a Case of Pernicious Vomiting in Pregnancy." Discussed by Drs. E. E. Montgomery, Philadelphia; M. E. Klingler, Garrett, Ind.; Stephen E. Tracy, Philadelphia, and W. P. Manton, Detroit.

FRIDAY, JUNE 14—MORNING

Dr. Henry T. Byford, Chicago, was elected temporary chairman in the absence of Dr. Anspach, returned to the service.

Dr. John B. Deaver, Philadelphia, read a paper on "Avoidable Traumatic Abdomen." Discussed by Drs. Stephen E. Tracy, Philadelphia; Peter B. Salatich, New Orleans; Emil Novak, Baltimore; A. E. Walker, Anthony, Kan.; A. P. Butt, Davis, W. Va., and John B. Deaver, Philadelphia.

Dr. Franklin H. Martin, Chicago, spoke on "How Surgeons Can Help Win the War." Discussed by Dr. Alfred A. Strauss, Chicago, and Dr. Franklin H. Martin, Chicago.

Dr. Joseph Rilus Eastman, Indianapolis, read a paper on "The Question of Operation in Abdominal Gunshot Injuries." Discussed by Drs. Daniel N. Eisendrath, Chicago, and John Young Brown, St. Louis.

The following officers were elected: chairman, Dr. Thomas J. Watkins, Chicago; vice chairman, Dr. John W. Keefe, Providence, R. I.; secretary, Dr. Sidney A. Chalfant, Pittsburgh; delegate, Dr. F. F. Simpson, Pittsburgh.

Dr. Ira L. Hill, New York, presented for the consideration of the Section on Obstetrics, Gynecology and Abdominal Surgery a resolution "That the American Medical Association appeal to the U. S. government for the appointment of a national commission for the reduction of mortality in childbirth." This resolution was on motion adopted and referred to the delegate of the section for presentation to the House of Delegates of the American Medical Association for action. (No action by the House of Delegates at the 1918 session.)

Dr. Willard Bartlett, St. Louis, read a paper on "Treatment of Incisional Ventral Hernia by the Transplantation of Fascia Lata." Discussed by Drs. Weller Van Hook, Chicago; Alfred A. Strauss, Chicago; C. H. Magee, Burlington, Iowa; Arthur E. Hertzler, Kansas City, Mo.; Peter B. Salatich, New Orleans; Albert Goldspohn, Chicago; S. E. Williams, Chippewa Falls, Wis.; W. P. Manton, Detroit, and Willard Bartlett, St. Louis.

Dr. John W. Keefe, Providence, R. I., read a paper on "The Use of the Rubber Roll in Abdominal Surgery." Discussed by Drs. Albert Goldspohn, Chicago; Melvin J. Locke, Bellefonte, Pa., and John W. Keefe, Providence, R. I.

Dr. Emil Novak, Baltimore, read a paper on "Infantilism and Other Hypoplastic Conditions of the Uterus." No discussion.

FRIDAY, JUNE 14—AFTERNOON

Dr. Nathaniel R. Mason, Boston, and Dr. Frank C. W. Konrad, Boston, presented a paper on "Paravertebral Anesthesia, with Report of One Hundred Cases." Discussed by Drs. Arthur E. Hertzler, Kansas City, and Dr. Frank C. W. Konrad, Boston.

Dr. Arthur E. Hertzler, Kansas City, Mo., read a paper on "The Pathology of Hemorrhagic Myomas and Their Relation to Sarcoma." Discussed by Drs. Emil Novak, Baltimore; Bertha Van Hoosen, Chicago, and Arthur E. Hertzler, Kansas City, Mo.

Dr. Edward A. Weiss, Pittsburgh, read a paper on "The Radical Treatment of Cancer of the Cervix by Igni Extirpation." Discussed by Drs. Albert Goldspohn, Chicago; George Gellhorn, St. Louis; Louis E. Schmidt, Chicago; Bertha Van Hoosen, Chicago; John W. Keefe, Providence, R. I.; J. A. Pettit, Portland, Ore.; Edward A. Weiss, Pittsburgh, and Henry P. Newman, San Diego.

Dr. George Gellhorn, St. Louis, read a paper on "The Conservation of Ovaries After Hysterectomy, with a New Technic of Extirpation of the Uterus." Discussed by Drs. Henry T. Byford, Chicago; Peter B. Salatich, New Orleans; Henry P. Newman, San Diego; C. H. Magee, Burlington, Iowa; Harvey P. Jack, Hornell, N. Y., and George Gellhorn, St. Louis.

Dr. K. I. Sanes, Pittsburgh, read a paper on "Age of Menopause: Observations Based on Statistical Data of Eight Hundred Menopause Cases." Discussed by Dr. Curtis S. Foster, Pittsburgh.

Dr. Stephen E. Tracy, Philadelphia, read a paper on "Plastic Operations in the Vagina and on the Pelvic Floor." Discussed by Drs. Henry P. Newman, San Diego; Albert Goldspohn, Chicago, and Dr. Stephen E. Tracy, Philadelphia.

SECTION ON OPHTHALMOLOGY

WEDNESDAY, JUNE 12—MORNING

In the absence of the chairman, Dr. Alexander Duane, New York, the vice chairman, F. Phinizy Calhoun, Atlanta, Ga., presided. Dr. Edgar S. Thomson, New York, acted as secretary. The session was called to order at 9:15 by the vice chairman, who made a brief address.

The chairman's address, entitled "How May the Physical Standards of the Service Profitably Be Modified?" was read.

Dr. F. Park Lewis, Buffalo, moved that the section arrange a round table at which certain questions may be propounded and answered.

Dr. Edward Jackson, Denver, moved as a substitute that the pending motion, as well as similar suggestions, be referred to the Executive Committee. Seconded and carried.

Dr. Bulson presented the report on the Knapp Testimonial Fund Committee which, on motion duly made and seconded, was ordered received and filed.

Dr. John E. Weeks, New York, read a paper on "Disciform Keratitis." Discussed by Drs. William Zentmayer, Philadelphia; John Green, Jr., St. Louis; Arthur G. Bennett, Buffalo; Will Walter, Chicago; Edgar S. Thomson, New York; Arthur J. Bedell, Albany, N. Y.; F. Park Lewis, Buffalo; John M. Wheeler, New York; R. H. von Kotsch, Chicago; Jesse S. Wyler, Cincinnati, and John E. Weeks, New York.

Dr. Robert J. Curdy, Kansas City, Mo., read a paper on "The Action of Miotic Drugs on Eyes, with Incomplete Sphincter Iritis." Discussed by Drs. Frank C. Todd, Minneapolis, and Robert J. Curdy, Kansas City, Mo.

Dr. John M. Wheeler, New York, read a paper on "Paralysis of the Sixth Cranial Nerve, Associated with Otitis Media." Discussed by Drs. Walter H. Snyder, Toledo, Ohio; H. H. Stark, El Paso, Texas, and John M. Wheeler, New York.

Dr. Lucien Howe, Buffalo, read a paper on "The Relation of Hereditary Eye Defects to Genetics and Eugenics." Discussed by Drs. Howard H. Newman, Chicago; F. Park Lewis, Buffalo; L. M. Loeb, Chicago; F. G. Stueber, Lima, Ohio, and Lucien Howe, Buffalo.

Dr. William R. Thompson, Fort Worth, Texas, read a paper on "The Rational Etiology and Satisfactory Treatment of Dacryocystitis." Discussed by Drs. Harry W. Woodruff, Joliet, Ill.; John Green, Jr., St. Louis; Arthur E. Prince, Springfield, Ill.; Harold Gifford, Omaha; Melville Black, Denver; G. H. Mundt, Chicago, and William R. Thompson, Fort Worth, Texas.

Dr. Lucien Howe, Buffalo, presented the following resolution:

> *Resolved*, That a committee be appointed by the chair to report what action, if any, should be recommended by this section for the prevention of inherited blindness, this committee to be composed of one ophthalmologist, one professional geneticist and one practitioner, especially conversant with the good and also with the bad effects of sterilization. The members of this committee shall have power to add to their number as they deem advisable.

Dr. Howe moved the adoption of the resolution. Seconded and carried.

Dr. Howe presented the report of the Committee on Collective Investigation Concerning Ocular Muscles and moved the adoption of the report. On motion, duly seconded and carried, the report was adopted.

Wednesday, June 12—Afternoon

Vice Chairman Calhoun called the session to order at 2 o'clock.

The vice chairman announced that the resolution which was introduced by Dr. Lucien Howe at the preceding session called for the appointment of a committee for the prevention of inherited blindness. The chairman stated that this committee should consist of Dr. Howe, as chairman, and Drs. H. H. Laughlin and John A. Reilly, this being with the approval of the Executive Committee.

Dr. T. B. Holloway, Philadelphia, exhibited an instrument demonstrating the various forms of refraction.

Dr. George E. de Schweinitz, Philadelphia, read a paper on "Some Aspects of Military Ophthalmic Surgery."

Dr. William H. Wilder, Chicago, read a paper on "Visual Standards of the U. S. Army."

Dr. Waid E. Carson, Pittsburgh, read a paper on "Visual Standards of the U. S. Navy."

The paper of Dr. Allen Greenwood, Boston, on "The Eyes of the Army," was presented in a short summary by Dr. Hiram Woods, Baltimore.

Dr. Edward Jackson, Denver, read a paper on "Common Changes in Regular Astigmatism and Their Causes." Discussed by Drs. Arthur G. Bennett, Buffalo; William Zentmayer, Philadelphia; Joseph S. Lichtenberg, Kansas City, Mo., and Edward Jackson, Denver.

Dr. Howard S. Clark, Minneapolis, read a paper on "Maculocerebral Degeneration with Dementia." Discussed by Drs. F. Park Lewis, Buffalo; Harold Gifford, Omaha, and Edward J. Bernstein, Detroit.

Friday, June 14—Morning

The section was called to order at 9:15 by Vice Chairman Calhoun.

The following officers were elected: chairman, Dr. Cassius D. Wescott, Chicago; vice chairman, Dr. Thomas B. Holloway, Philadelphia; secretary, Dr. Edgar S. Thomson, New York; delegate, Dr. Walter B. Lancaster, Boston; alternate, Dr. Edward H. Cary, Dallas, Texas.

Dr. Edward Jackson, Denver, was reelected as a member of the American Board of Ophthalmic Examination, for the term of three years beginning with the expiration of his present term, January 1.

Dr. Thomson, on behalf of the chairman of the committee, read the report of the local chairman of the Committee on Conservation of Vision.

On motion, duly seconded and carried, the report was accepted.

Dr. Hiram Woods, Baltimore, presented the report of the American Board for Ophthalmic Examination.

On motion duly seconded and carried, the report was received and filed.

The report of the Committee on Standardizing Test Cards was presented by Dr. Ewing, on behalf of the chairman, Dr. Jackson.

On motion duly seconded and carried, the report was received and filed.

The Committee on Award of the Knapp Medal had no report to make.

The next order of business was the election of a committee on Award of the Knapp Medal. The following were selected: Drs. W. H. Wilder, Chicago; Walter R. Parker, Detroit, and Arnold Knapp, New York.

In view of the serious illness of Dr. Adolf Alt, an ex-chairman of this section, Dr. Greene moved that the Section on Ophthalmology extend to Dr. Adolf Alt its greetings and best wishes for his speedy restoration to health. Seconded and carried.

Dr. Zentmayer moved that a resolution of sympathy be sent to Dr. Wescott, chairman elect of this section for the ensuing year (Dr. Wescott having been recently operated on and being still in the hospital), the resolution also expressing the wishes of the section for his speedy recovery. Seconded and carried.

Dr. William W. Kahn, Detroit, read a paper on "Pollakiuria or Excessive Frequency of Micturition as a Functional Disturbance Due to Eyestrain." Discussed by Drs. Isaac Hartshorne, New York, and William W. Kahn, Detroit.

Drs. John Green, Jr., and William F. Hardy, St. Louis, presented a paper on "Astigmatism Against the Rule." Discussed by Drs. Walter B. Lancaster, Boston; H. B. Lemere, Omaha; William W. Kahn, Detroit; Clark W. Hawley, Chicago; Edgar S. Thomson, New York, and William F. Hardy, St. Louis.

Dr. James G. Dwyer, New York, read a paper on "Focal Infections of the Eye from the Intestinal Tract." Discussed by Drs. Edgar S. Thomson, New York; Hiram Woods, Baltimore; Harry Gradle, Chicago; Clark W. Hawley, Chicago; Walter B. Lancaster, Boston; Will Walter, Chicago, and James G. Dwyer, New York.

Dr. F. Phinizy Calhoun, Atlanta, Ga., read a paper on "Alterations in the Visual Fields Associated with Pellagra." Discussed by Drs. Edward V. L. Brown, Chicago, and F. Phinizy Calhoun, Atlanta, Ga.

Dr. Edward H. Cary, Dallas, Texas, read a paper on "A Study of the Histology and Pathology of the Superstructure of the Lid Occurring in Trachoma," with motion pictures. Discussed by Drs. Vard H. Hulen, San Francisco; C. H. Dewey, Washington, D. C.; Arthur E. Prince, Springfield, Ill., and Edward H. Cary, Dallas, Texas.

Friday, June 14—Afternoon

The section was called to order by the vice chairman.

Dr. Hunter H. Turner, Pittsburgh, read a paper on "The Etiology of Phlyctenular Ophthalmia." Discussed by Drs. Edward B. Heckel, Pittsburgh; Henry E. Goldberger, Chicago, and Hunter H. Turner, Pittsburgh.

Dr. Arthur E. Ewing, St. Louis, read a paper on "Postciliary Scleral Trephining for Acute Glaucoma." Discussed by Drs. William F. Hardy, St. Louis, and Arthur E. Ewing, St. Louis.

Dr. Harold Gifford, Omaha, read a paper on "The Treatment of Blood Cysts of the Orbit." The discussion on this paper by Dr. Albert E. Bulson, Fort Wayne, Ind., was read by the secretary owing to the absence of Dr. Bulson. The paper was further discussed by Dr. Harold Gifford, Omaha.

Dr. Melville Black, Denver, read a paper on "The Management of Certain Intractable Lid Conditions." Discussed by Drs. J. S. Clark, Freeport, Ill.; Oliver Tydings, Chicago, and Dr. H. B. Lemere, Omaha.

Dr. Arthur E. Prince, Springfield, Ill., read a paper on "An Operation for Cataract Especially Adapted to Cases of Intractable Sepsis of the Conjunctiva or the Lacrimal Sac."

Drs. William H. Fisher and H. D. Thornburg, Chicago, presented a paper entitled "A Method of Acquiring Cataract Technic Leading to the Smith-Indian Intracapsular."

These two papers were discussed by Drs. Louis D. Green, San Francisco; Vard H. Hulen, San Francisco; Clark W. Hawley, Chicago; John W. Wright, Columbus, Ohio; Lewis K. Beck, San Antonio, Texas; Ira E. Hoffman, Chicago; G. H. Mundt, Chicago; Arthur E. Prince, Springfield, Ill.; H. D. Thornburg, Chicago, and William A. Fisher, Chicago.

SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Wednesday, June 12—Morning

The section was called to order at 9:20 by the chairman, Dr. Greenfield Sluder, St. Louis.

Dr. Sluder read the chairman's address, entitled "The Specialist's Relation to the American Medical Association." Discussed by Drs. Wendell C. Phillips, New York, and George F. Cott, Buffalo.

The secretary, Dr. L. W. Dean, Iowa City, Iowa, moved that the acting chairman, Dr. Thomas Hubbard, Toledo, Ohio, appoint a committee of three on chairman's address, this committee to report at the Friday morning session. Seconded and carried. The following were appointed: Drs. William B. Chamberlin, Cleveland; George E. Shambaugh, Chicago, and J. A. Stucky, Lexington, Ky.

Dr. Chevalier Jackson, Philadelphia, read a paper on "Acromegaly of the Larynx." Discussed by Drs. William B. Chamberlin, Cleveland, and Chevalier Jackson, Philadelphia.

Dr. Thomas Hubbard, Toledo, Ohio, read a paper on "Certain Traumatic Lesions of the Esophagus." Discussed by Drs. Chevalier Jackson, Philadelphia; George F. Keiper, Lafayette, Ind.; J. A. Stucky, Lexington, Ky.; George F. Cott, Buffalo; William B. Chamberlin, Cleveland; Joseph C. Beck, Chicago; G. C. Kneedler, Pittsburgh; Eugene L. Myers, St. Louis, and Dr. Thomas Hubbard, Toledo, Ohio.

Dr. Wendell C. Phillips, New York, moved that a committee be appointed by the chairman of this section to prepare a statement recommending legislation in regard to the labeling of caustic preparations, and that this appeal be made through the Council on Pharmacy and Chemistry of the American Medical Association. Seconded and carried.

Dr. Hugh T. Patrick, Chicago, read a paper on "Indurative Headaches." Discussed by Drs. George E. Shambaugh, Chicago; H. W. Loeb, St. Louis; Oliver Tydings, Chicago; Arthur M. Corwin, Chicago; Charles D. Thomas, Peoria, Ill., and Hugh T. Patrick, Chicago.

Dr. Joseph W. Charles, St. Louis, read a paper on "Ocular Headaches." Discussed by Drs. William W. Pearson, Des Moines, Iowa; Oscar Wilkinson, Washington, D. C.; Frank Allport, Chicago, and Joseph W. Charles, St. Louis.

Wednesday, June 12—Afternoon

The section was called to order at 2:20 by the chairman, Dr. Greenfield Sluder, St. Louis.

Dr. Greenfield Sluder presented a new friction lock for a tonsil guillotine. This can be used without changing the position of the fingers or loosening the grip, and when the guillotine is shut it stays.

Dr. George W. Boot, Chicago, presented a safety pin extractor, in which the point of the pin can be drawn within a spiral.

The chairman then appointed the committee mentioned in Dr. Wendell C. Phillips' motion at the morning session, as follows: Drs. Thomas Hubbard, Toledo, Ohio; Chevalier Jackson, Philadelphia, and Hubert Arrowsmith, Brooklyn.

Dr. Wendell C. Phillips moved that this committee be approved by the section. Seconded and carried.

The paper of Dr. Harris P. Mosher, Lieutenant-Colonel, M. C., N. A., entitled "Informal Report on Activities of Section on Surgery of the Head of Surgeon-General's Office," was read.

Major Norval H. Pierce, Chicago, read a paper on "Otolaryngology in the Army Medical Service."

These two papers were discussed by Drs. Charles W. Richardson, Washington, D. C.; R. H. Fowler, New York; H. W. Loeb, St. Louis; John B. Potts, Omaha, and Norval H. Pierce, Chicago.

The chairman appointed Drs. Elmer L. Kenyon, Chicago; William B. Chamberlin, Cleveland, and Joseph A. Stucky, Lexington, Ky., a committee of three to draft suitable resolutions regarding the war work of the otolaryngologists and ophthalmologists.

The chairman appointed as the Nominating Committee Drs. George F. Cott, Buffalo; George F. Keiper, Lafayette, Ind., and Louis Ostrom, Jr., Rock Island, Ill.

Dr. J. Gordon Wilson, Chicago, read a paper on "Results of Concussion of High Explosive Shells on the Ear." Discussed by Drs. Thomas Hubbard, Toledo, Ohio; Roy W. Dunlap, Tulsa, Okla.; H. W. Loeb, St. Louis; Samuel G. Higgins, Milwaukee, and J. Gordon Wilson, Chicago.

Dr. Joseph A. Stucky, Lexington, Ky., read a paper on "Systemic Factors in the Treatment of Acute and Subacute Sinusitis." Discussed by Drs. George F. Keiper, Lafayette, Ind.; Frank R. Spencer, Boulder, Colo., and Joseph A. Stucky, Lexington, Ky.

The chairman then introduced Dr. Eugene R. Lewis of the Medical Reserve Laboratory, Field No. 1, Mineola, L. I., who gave a short talk on the work being done among the aviators.

Friday, June 14—Morning

The section was called to order at 9:15 by the secretary, Dr. L. W. Dean, who announced that Dr. Greenfield Sluder had been called home. Dr. George F. Cott, Buffalo, occupied the chair.

The following officers were elected: chairman, Dr. L. W. Dean, Iowa City, Iowa; vice chairman, Dr. Eugene R. Lewis, Mineola, L. I.; secretary, Dr. William B. Chamberlin, Cleveland; delegate, Dr. George F. Keiper, Lafayette, Ind.; alternate, Dr. Frank R. Spencer, Boulder, Colo.

The Committee on Chairman's Address then made its report, which on motion, seconded and carried, was adopted.

The report of the committee to draft resolutions regarding war work was then read and, on motion seconded and carried, was adopted.

The report of the Committee on Necrology was read by Dr. W. B. Chamberlin, Cleveland. But one name was reported this year—Dr. Ephraim Fletcher Ingals, Chicago. On motion, seconded and carried, the report was accepted.

Dr. Warren B. Davis, Philadelphia, read a paper on "Anatomy of the Nasal Accessory Sinuses in Infancy and Childhood." Discussed by Drs. George E. Shambaugh, Chicago; Joseph C. Beck, Chicago; H. A. Canfield, Bradford, Pa., and Warren B. Davis, Philadelphia.

Dr. Henry H. Martin, Savannah, Ga., read a paper on "Treatment of Neuralgia of the Fifth Nerve by Injection of the Gasserian Ganglion." Discussed by Drs. Hugh T. Patrick, Chicago; Joseph C. Beck, Chicago, and Henry H. Martin, Savannah, Ga.

Dr. J. Randolph Page, New York, read a paper on "Anatomy of the Lateral Sinus: Its Connections and Anomalies." Discussed by Drs. George E. Shambaugh, Chicago, and J. Randolph Page, New York.

Dr. Jacob Braun, New York, read a paper on "The Snaretome Operation for Enucleation of the Tonsil." Discussed by Drs. Frank R. Spencer, Boulder, Colo.; Louis Ostrom, Jr., Rock Island, Ill.; Leon A. Feinstein, St. Louis; Oliver Tydings, Chicago; H. H. Martin, Savannah, Ga.; James A. Watson, Minneapolis, and Jacob Braun, New York.

Dr. J. Leslie Davis, Philadelphia, read a paper on "Diseased Faucial Tonsils: Their Toxic, Infectious and Reflex Effects." Discussed by Dr. George F. Keiper, Lafayette, Ind.

Dr. Thomas W. Moore, Huntington, W. Va., read a paper on "The Present Status of the Operative Treatment of Chronic Frontal Sinusitis." Discussed by Drs. Frank R. Spencer, Boulder, Colo.; George E. Shambaugh, Chicago, and James J. Pattee, Pueblo, Colo.

Dr. Henry B. Lemere, Omaha, read a paper on "The Relation of the Movements of the Head and Eyes to Labyrinth Stimulation." Discussed by Drs. Joseph G. Parsons, Sioux Falls, S. D.; George W. Mackenzie, Philadelphia, and Henry B. Lemere, Omaha.

SECTION ON DISEASES OF CHILDREN

Wednesday, June 12—Morning

The meeting was called to order at 9:30 by the chairman, Dr. Laurence R. DeBuys, New Orleans.

Owing to the absence of Dr. T. C. McCleave, Oakland, Calif., delegate to the House of Delegates of the American Medical Association, the chairman appointed Dr. H. M. McClanahan, Omaha, to represent the section in the House of Delegates.

Dr. DeBuys read the chairman's address, entitled "Conservation of Child Life, a National Responsibility."

A motion was made by Dr. William Weston, Columbia, S. C., that the chairman appoint a committee of three to confer with the Surgeon-General's Office relative to the status of the pediatric men in this country.

Seconded and carried.

The chairman appointed the following committee: Dr. J. P. Sedgwick, Minneapolis, chairman; Dr. E. C. Fleischner, San Francisco, and William Weston, Columbia, S. C.

Dr. Paul Armand-De Lille, Paris, France, read a paper on "The Infant Mortality Campaign in France."

Dr. William Palmer Lucas, San Francisco, read a paper on "Medical Work Among the Civilian Population in France."

Dr. Grace L. Meigs, Washington, D. C., read a paper on "Children's Year Program for Child Conservation in War Time."

Drs. Julius P. Sedgwick and N. O. Pearce, Minneapolis, presented a paper on "A Report on Children in the War Zone," read by Dr. Pearce.

These papers were discussed by Drs. B. Raymond Hoobler, Detroit; Edgar J. Huenekens, Minneapolis; Lawrence T. Royster, Norfolk, Va.; Joseph I. Grover, Boston; Franklin N. Rogers, Manchester, N. H.; Louis H. Schwartz, New York; John A. Foote, Washington, D. C.; J. T. Christison, St. Paul; Langley Porter, San Francisco; C. F. Wahrer, Fort Madison, Iowa; Frances M. Hollingshead, Columbus, Ohio; Leroy A. Wilkes, Bridgeport, Conn.; E. C. Fleischner, San Francisco; J. P. Sedgwick, Minneapolis; Grace L. Meigs, Washington, D. C.; William Palmer Lucas, San Francisco, and Laurence R. DeBuys, New Orleans.

Wednesday, June 12—Afternoon

The meeting was called to order at 2:30 by the chairman.

Dr. Henry H. Yerington, San Francisco, read a paper on "Clinical Supervision of the Well Baby During Its First Year." Discussed by Drs. C. F. Wahrer, Fort Madison, Iowa, and Louis H. Schwartz, New York.

Dr. Henry J. Gerstenberger, Cleveland, read a paper on "A Report of Three Years' Clinical Experience with the Feeding of S. A. M. (Synthetic Milk Adapted)." Discussed by Drs. C. F. Wahrer, Fort Madison, Iowa; John Zahorsky, St. Louis; Isaac A. Abt, Chicago; Louis H. Schwartz, New York, and Henry J. Gerstenberger, Cleveland.

Dr. Jay I. Durand, Seattle, read a paper on "Digestion of Fat by Gastric and Intestinal Ferment." No discussion.

Dr. Jules M. Brady, St. Louis, read a paper on "Lumbar Puncture in Meningeal Hemorrhage." Discussed by Drs. Frank C. Neff, Kansas City, Mo.; John A. Foote, Washington, D. C.; Lawrence T. Royster, Norfolk, Va., and Jules M. Brady, St. Louis.

Dr. Albert H. Beifield, Iowa City, Iowa, read a paper on "The Significance of Infection of the Accessory Sinuses of the Nose of Infants and Children." Discussed by Drs. R. N. Andrews, Mankato, Minn.; Henry J. Gerstenberger, Cleveland; John Zahorsky, St. Louis; Albert H. Beifield, Iowa City, Iowa, and Paul Armand-De Lille, Paris, France.

Dr. Langley Porter, San Francisco, read a paper on "Chorea." Discussed by Drs. Henry J. Gerstenberger, Cleveland; Henry W. Cheney, Chicago; J. T. Christison, St. Paul, and Langley Porter, San Francisco.

The committee appointed to confer with the Surgeon-Generals made its report.

Dr. E. C. Fleischner presented a resolution to be presented to the War Council as follows:

> *Resolved*, That the War Council of the American Red Cross be asked to appropriate $100,000 for the purpose of better child welfare work, assisting existing organizations working in child welfare work and organizing this work, when approved by the Medical Advisory Board of the American Red Cross. This sum to be expended under the direction of the said committee.

Referred to the House of Delegates with the unanimous approval of those attending the meeting. (See proceedings of the House of Delegates.)

Friday, June 14—Morning

The meeting was called to order at 9:25 by the chairman.

The following officers were elected: chairman, Dr. Frank P. Gengenbach, Denver; vice chairman, Dr. Jay I. Durand, Seattle; secretary, Dr. E. C. Fleischner, San Francisco; delegate, Dr. Isaac A. Abt, Chicago; alternate, Dr. Laurence R. DeBuys, New Orleans.

Dr. Rood Taylor, Rochester, Minn.. read a paper on "Treatment of Prematurity." Discussed by Drs. John Zahorsky, St. Louis; Isaac A. Abt, Chicago; Lawrence T. Royster, Norfolk, Va.; Frank C. Neff, Kansas City, Mo.; Jane Merrill Ketcham, Indianapolis; Jules M. Brady, St. Louis; Jay I. Durand, Seattle, and E. J. Huenekens, Minneapolis.

Drs. Harry Lowenburg and A. I. Rubenstone, Philadelphia, presented a paper on "Hemophilia," read by Dr. Lowenburg. Discussed by Drs. C. F. Wahrer, Fort Madison, Iowa; Abraham Jacobi, New York; Rood Taylor, Rochester, Minn., and William Weston, Columbia, S. C.

Dr. Harry M. McClanahan, Omaha, read a paper on "Intestinal Parasites in Children." Discussed by Drs. William Weston, Columbia, S. C.; C. F. Wahrer, Fort Madison, Iowa; A. H. Beifield, Iowa City, Iowa, and Harry M. McClanahan, Omaha.

Dr. Louis Fischer, New York, read a paper on "The Superior Longitudinal Sinus in Infants; Its Value in Transfusion, and for Rapid Medication; Its Adaptability in Procuring Blood for Diagnosis." Discussed by Dr. Harry Lowenburg, Philadelphia.

Dr. William Weston, Columbia, S. C., read a paper on "Purpura Abdominalis in Early Life." Discussed by Drs. John A. Foote, Washington, D. C.; Rood Taylor, Rochester, Minn.; Isaac A. Abt, Chicago; M. L. Turner, Des Moines, Iowa, and William Weston, Columbia, S. C.

Dr. Joseph I. Grover, Boston, read a paper on "Etiology and Treatment of Enuresis." Discussed by Drs. Harry Lowenburg, Philadelphia; H. M. McClanahan, Omaha; M. L. Turner, Des Moines, Iowa; O. W. Rowe, Duluth, Minn.; Franklin N. Rogers, Manchester, N. H., and Joseph I. Grover, Boston.

Dr. Lawrence T. Royster, Norfolk, Va., on behalf of the Executive Committee, presented the name of Dr. Paul Armand-De Lille, Paris, France, for recommendation by this section to honorary membership in the American Medical Association. Unanimously endorsed by the section. (Not transmitted to the House of Delegates in time for action at the 1918 session.)

Friday, June 14—Afternoon

The meeting was called to order at 2:20 by the chairman.

Dr. Edgar J. Huenekens, Minneapolis, read a paper on "Further Report on Pertussis Vaccine Controlled by the Complement Fixation Test." Discussed by Drs. J. T. Christison, St. Paul; Jay I. Durand, Seattle; E. C. Fleischner, San Francisco; Frank C. Neff, Kansas City, Mo., and Edgar J. Huenekens, Minneapolis.

Drs. Emanuel C. Fleischner and K. F. Meyer, San Francisco, presented a paper on "Cutaneous Hypersensitiveness as an Evidence of Infection, and Its Bearing on the Pathogenicity for Infants of the *Bacillus Abortus-Bovinus.*" No discussion.

Dr. John Zahorsky, St. Louis, read a paper on "The Remote Results of Tonsillectomy in the Young." Discussed by Drs. Harry Lowenburg, Philadelphia; Isaac A. Abt, Chicago; E. C. Fleischner, San Francisco; J. P. Sedgwick, Minneapolis, and John Zahorsky, St. Louis.

Dr. Charles E. Hansel, South Bend, Ind., read a paper on "Group Medicine and Pediatrics." Discussed by Drs. R. N. Andrews, Mankato, Minn.; Franklin N. Rogers, Manchester, N. H.; Joseph I. Grover, Boston; O. W. Rowe, Duluth, Minn., and Charles E. Hansel, South Bend, Ind.

Dr. Albert J. Bell, Cincinnati, read a paper on "The Diagnostic Study of Conditions in the Throat Producing Dyspnea." No discussion.

Moved and seconded that Dr. Zahorsky be granted permission to withdraw his paper. Passed.

SECTION ON PHARMACOLOGY AND THERAPEUTICS

Wednesday, June 12—Morning

The Section was called to order at 9:15 by the chairman, Dr. Arthur D. Hirschfelder, Minneapolis. The chairman appointed as the Executive Committee Drs. J. F. Anderson, New Brunswick, N. J.; Torald Sollmann, Cleveland, and C. W. Edwards, Ann Arbor, Mich. The chairman appointed as the nominating committee Drs. Torald Sollmann, Cleveland; Cary Eggleston, New York, and W. A. Puckner, Chicago.

to Secretary Hamilton, who has handled the work connected with his office during the past three years. Dr. Albert E. Sterne, Indianapolis, seconded the motion, and it was carried by rising vote.

Dr. William A. Jones, Minneapolis, said: In view of the work contributed by the medical profession, both at its annual meetings and through the efforts of the men directly connected with war activities, I move that the Transportation Committee of the American Medical Association be requested to secure reduced railroad rates to members of the Association, and particularly to those who live at a distance, and that this motion be transmitted to the secretary of the American Medical Association through the secretary of this section.

Dr. Lesser Kauffman, Buffalo, seconded this motion, which was unanimously carried.

With reference to the paper entitled "A Psychiatric Contribution to the Problem of Prison Reform," by Dr. Herman M. Adler, Chicago, it was moved by Dr. C. Eugene Riggs, St. Paul, that because of the lateness of the hour, and in view of the fact that the author was present, the paper be read by title and passed. Seconded and carried.

SECTION ON DERMATOLOGY

Wednesday, June 12—Morning

The meeting was called to order at 9:30 by the chairman, Dr. Henry H. Hazen, Washington, D. C.

The chairman appointed Dr. Ernest D. Chipman, San Francisco, to serve on the Executive Committee in the place of Dr. Howard Fox, New York, who was in active service with the Medical Reserve Corps.

Dr. Henry H. Hazen, Washington, D. C., read the chairman's address, entitled "The Duties of the Dermatologist."

The following papers were read as a symposium on "Skin Tuberculosis."

Dr. Fred Wise, New York, read the paper submitted by Dr. Sigmund S. Pollitzer, New York, on "Cutaneous Tuberculosis: a Survey."

Dr. Fred Wise, New York: "Miliary Tuberculosis of the Skin, Lichen Scrofulosum and Papulonecrotic Tuberculids."

Drs. Samuel E. Sweitzer and Henry E. Michelsen, Minneapolis: "Sarcoids and Erythema Induratum of Bazin."

Drs. John E. Lane, New Haven, Conn., and Max Scheer, New York: "Dermatoses Possibly Related to Tuberculosis."

These four papers were discussed by Drs. Joseph Zeisler, Chicago; Richard L. Sutton, Kansas City, Mo.; John A. Fordyce, New York; J. H. Stokes, Rochester, Minn.; Frederick G. Harris, Chicago; Augustus Ravogli, Cincinnati; Walter J. Heimann, New York; Everett S. Lain, Oklahoma City; Ernest D. Chipman, San Francisco; Moses Scholtz, Cincinnati; Fred Wise, New York; John E. Lane, New Haven, Conn., and Henry E. Michelsen, Minneapolis.

Dr. Meyer L. Heidingsfeld, Cincinnati, read a paper on "The Too Intensive Arsphenamin (Salvarsan) Treatment of Syphilis." Discussed by Drs. John H. Fordyce, New York; Budd C. Corbus, Chicago; J. H. McBride, Kansas City, Mo.; John E. Lane, New Haven, Conn.; Richard L. Sutton, Kansas City, Mo.; King Smith, Toronto; E. J. Trowe, Toronto; Fred Wise, New York; Joseph Zeisler, Chicago; Bernard Erdman, Indianapolis; Arthur W. Stillians, Chicago; Walter J. Heimann, New York; Henry R. Varney, Detroit, and Meyer L. Heidingsfeld, Cincinnati.

The chairman appointed the following nominating committee: Drs. John E. Lane, New Haven, Conn., Henry R. Varney, Detroit, and J. B. Shelmire, Dallas, Texas.

Wednesday, June 12—Afternoon

The meeting was called to order at 2:30 by the chairman, Dr. Henry H. Hazen, Washington, D. C.

The following papers were read as a symposium on "Syphilis in Its Economic Aspects."

Drs. Wade H. Brown and Louise Pearce, New York: "Experimental Therapy in Syphilis."

Dr. William Allen Pusey, Chicago: "The Handling of the Venereal Disease Problem in the Army at the Present Time."

Dr. John A. Fordyce, New York: "The Value of Early Diagnosis and Immediate Treatment in Preventing Neurosyphilis; Its Economic Aspects."

Dr. Harry G. Irvine, Minneapolis: "Syphilis and Venereal Diseases as a Public Health Problem."

These four papers were discussed by Drs. John E. Lane, New Haven, Conn.; John H. Stokes, Rochester, Minn.; King Smith, Toronto; Abram Schuyler Clark, New York; Fred Wise, New York; James Herbert Mitchell, Chicago; Loyd Thompson, Hot Springs, Ark.; Moses Scholtz, Cincinnati; A. H. Martin, Hot Springs, Ark.; Frank Wright, Minneapolis; Walter J. Heimann, New York; Wade H. Brown, New York; William Allen Pusey, Chicago; John H. Fordyce, New York, and Harry G. Irvine, Minneapolis.

Friday, June 14—Morning

The meeting was called to order at 9:30 by the chairman, Dr. Henry H. Hazen, Washington, D. C.

The following officers were elected: chairman, Dr. Otto H. Foerster, Milwaukee; vice chairman, Dr. David Lieberthal, Chicago; secretary, Dr. Walter J. Heimann, New York; delegate, Dr. George MacKee, New York; alternate, Dr. Fred Wise, New York.

The following papers were read as a symposium on "Bullous Dermatoses."

Dr. Walter J. Heimann, New York: "Pemphigus: a Clinical Study."

Dr. David Lieberthal, Chicago: "Toxic and Bullous Drug Eruptions and the Bullous Erythemas."

These two papers were discussed by Drs. Henry H. Hazen, Washington, D. C.; Richard L. Sutton, Kansas City, Mo.; Augustus Ravogli, Cincinnati; John A. Fordyce, New York; Michael L. Ravitch, Louisville, Ky.; Harry G. Irvine, Minneapolis; Jesse B. Shelmire, Dallas, Texas; Philip Frank Shaffner, Chicago; Samuel E. Sweitzer, Minneapolis; Everett S. Lain, Oklahoma City; Moses Scholtz, Cincinnati; Joseph Zeisler, Chicago; Walter J. Heimann, New York, and David Lieberthal, Chicago.

Dr. Lloyd W. Ketron, Baltimore, read a paper on "Unusual Forms of Epitheliomas of the Skin." Discussed by Drs. Henry H. Hazen, Washington, D. C.; Frederick G. Harris, Chicago; Richard L. Sutton, Kansas City, Mo.; Augustus Ravogli, Cincinnati; L. B. Mount, Albany, N. Y.; K. A. Zurawski, Chicago, and Lloyd W. Ketron, Baltimore.

Dr. Michael L. Ravitch, Louisville, Ky., read a paper on "Further Observations Concerning Dermatoses Attributed to Focal Infections."

Dr. Ernest Dwight Chipman, San Francisco, read a paper on "The Etiology of Lichen Planus."

These two papers were discussed by Drs. Richard L. Sutton, Kansas City, Mo.; King Smith, Toronto; John E. Lane, New Haven, Conn.; Frederick G. Harris, Chicago; Moses Scholtz, Cincinnati; Everett S. Lain, Oklahoma City; David Lieberthal, Chicago; J. S. Eisenstaedt, Chicago; K. A. Zurawski, Chicago; J. H. Stokes, Rocheser, Minn.; Henry H. Hazen, Washington, D. C.; Michael L. Ravitch, Louisville, Ky., and Ernest Dwight Chipman, San Francisco.

Friday, June 14—Afternoon

The meeting was called to order at 2:30 by the chairman, Dr. Henry H. Hazen, Washington, D. C.

Dr. Edward H. Reede, Washington, D. C., read a paper on "The Rôle of the Vegetative Nervous System in Certain Diseases of the Skin." Discussed by Drs. Ernest L. McEwen, Chicago; William Allen Pusey, Chicago; Richard L. Sutton, Kansas City, Mo.; Henry J. Gerstenberger, Cleveland; J. H. Stokes, Rochester, Minn.; Loretta Joy Cummins, Boston; Augustus Ravogli, Cincinnati; B. W. Eppler, Kalamazoo, Mich.; Henry H. Hazen, Washington, D. C.; Edward H. Reede, Washington, D. C.

Drs. Richard L. Sutton, Kansas City, Mo., and Frank E. Simpson, Chicago, presented a paper on "Retention Cysts of the Mucous Membrane of the Lip." Discussed by Drs. William Allen Pusey, Chicago, and Jesse B. Shelmire, Dallas, Texas.

Drs. Jesse B. Shelmire, and James H. Black, Dallas, Texas, presented a paper on "Adenoma Sebaceum: Report of Five Cases in One Family." Discussed by Drs. James Herbert Mitchell, Chicago; Richard L. Sutton, Kansas City, Mo., and Jesse B. Shelmire, Dallas, Texas.

Dr. Everett S. Lain, Oklahoma City, read a paper on "Dermatitis Lycopersicum Esculentum." Discussed by Drs. Arthur W. Stillians, Chicago; J. Frank Waugh, Chicago; Ernest L. McEwen, Chicago; Frederick G. Harris, Chicago; David Lieberthal, Chicago; Richard L. Sutton, Kansas City, Mo.; Robert G. Washburn, Milwaukee; Harold N. Cole, Cleveland; James Herbert Mitchell, Chicago; John E. Lane, New Haven, Conn.; William Allen Pusey, Chicago, and Everett S. Lain, Oklahoma City.

Dr. J. S. Eisenstaedt, Chicago, read a paper on "A Case of Sporotrichosis Resembling Tuberculosis of the Skin." Discussed by Drs. Frederick G. Harris, Chicago; K. A. Zurawski, Chicago; Richard L. Sutton, Kansas City, Mo.; Augustus Ravogli, Cincinnati, and J. S. Eisenstaedt, Chicago.

The newly elected officers were inducted into office and made brief and appropriate speeches of acceptance.

SECTION ON PREVENTIVE MEDICINE AND PUBLIC HEALTH

Wednesday, June 12—Morning

The meeting was called to order at 9:30 by the chairman, Dr. W. S. Rankin, Raleigh, N. C.

The following papers were read as a *symposium on* "Rural Sanitation":

Dr. W. S. Rankin, Raleigh, N. C.: "Coordinate Responsibility of Nation, State and County in Rural Sanitation." Discussed by Drs. J. W. Schereschewsky, Washington, D. C.; H. B. Hemenway, Springfield, Ill.; Otto P. Geier, Cincinnati; John N. Hurty, Indianapolis; James A. Hayne, Columbia, S. C., and W. S. Rankin, Raleigh, N. C.

Dr. John N. Hurty, Indianapolis: "State Responsibility and Aims in County Health Work." Discussed by Dr. René Sand of the Belgian Mission, on Industrial Management, Mr. F. L. Hoffman, Newark, N. J., and Dr. James A. Hayne, Columbia, S. C.

Dr. Otto P. Geier, Cincinnati, by request, made a statement on "Industrial Hygiene." Discussed by Dr. W. A. Evans, Chicago; Dr. J. W. Schereschewsky, Washington, D. C.; Major Edouard Rist, of the French Mission; Dr. William H. Welch, Lieutenant-Colonel, M. C., N. A.; Dr. Victor C. Vaughan, Colonel, M. C., N. A., and Dr. Oscar Dowling, Shreveport, La.

The following nominating committee was appointed: Dr. E. R. Kelley, Boston; Dr. Otto P. Geier, Cincinnati, and Dr. Oscar Dowling, Shreveport.

Dr. S. W. Welch, Montgomery, Ala., presented a resolution with reference to maintaining the working efficiency of the state boards of health of the several states.

The resolution was adopted.

Wednesday, June 12—Afternoon

A joint meeting was held with the Section on Orthopedic Surgery. For the proceedings, see the minutes of that section.

Friday, June 14—Morning

The chairman, Dr. W. S. Rankin, Raleigh, N. C., called the meeting to order at 9:20 o'clock.

The following officers were elected: chairman, Dr. C. St. Clair Drake, Springfield, Ill.; vice chairman, Dr. J. W. Schereschewsky, Washington, D. C.; secretary, Dr. Donald B. Lowe, Akron, Ohio; delegate, Dr. W. S. Rankin, Raleigh, N. C.

The chairman then introduced Dr. Victor C. Vaughan, Colonel, M. C., N. A., as the presiding officer, owing to the military nature of the program.

The following papers were read as a symposium on "Military Hygiene and Preventive Medicine":

Dr. Rufus I. Cole, New York: "Prevention of Pneumonia."

Dr. Simon Flexner, New York: "Control of Meningitis."

Dr. Martha Wollstein, New York: "Mumps."

These three papers were discussed by Drs. Victor C. Vaughan, Ann Arbor, Mich.; Frederick F. Russell, Washington, D. C.; P. F. Armand-De Lille, Boulogne, France; William C. Rucker, Washington, D. C.; H. Gideon Wells, Chicago; H. B. Hemenway, Springfield, Ill.; Simon Flexner, New York; Martha Wollstein, New York, and Rufus I. Cole, New York.

Dr. Wilbur A. Sawyer, Berkeley, Calif., read a paper on "Venereal Disease Control in the Army." Discussed by Drs. Victor C. Vaughan, Ann Arbor, Mich.; P. S. Schenk, Norfolk, Va.; J. O. Cobb, Colonel, U. S. P. H. S., and C. St. Clair Drake, Springfield, Ill.

Dr. C. F. Gelston, engaged for a year or more in assembling and helping to take care of the civilian people who have been returned from Germany to France, made a few remarks.

SECTION ON GENITO-URINARY DISEASES

Wednesday, June 12—Morning

The meeting was called to order by the chairman of the Executive Committee, Dr. Granville MacGowan, Los Angeles, at about 9 o'clock, who stated that because of the absence of the chairman of the section in France, and the death of the vice chairman, the conduct of the meeting developed on the Executive Committee, through its chairman, and that there would be no address by the chairman.

Dr. E. Otis Smith, Cincinnati, read a paper on "Anatomic and Pathologic Study of the Posterior Urethra."

Dr. Ernest M. Watson, Buffalo, read a paper on "The Human Vesicles at Birth, with Observations in Their Fetal Development."

Dr. Granville MacGowan, Los Angeles, read a paper on "Why Trained Urologists Should Be Employed to Treat Disease Conditions of the Posterior Urethra and the Bladder Neck."

These three papers were discussed by Drs. Charles M. Harpster, Toledo, Ohio; William T. Belfield, Chicago; Bransford Lewis, St. Louis; V. G. Vecki, San Francisco; John R. Caulk St. Louis; A. L. Wolbarst, New York; A. E. Goldstein, Baltimore, and V. D. Lespinasse, Chicago.

Drs. Loyd Thompson, Hot Springs, Ark., and Jacob Bolasny, Detroit, presented a paper on "Venereal Disease in the Thirty-Ninth Division." Discussed by Drs. F. M. McCallum Kansas City; V. G. Vecki, San Francisco; A. L. Wolbarst, New York; John R. Caulk, St. Louis; A. E. Goldstein, Baltimore; W. J. Wallace, Oklahoma City; A. E. Mowry, Chicago; W. G. A. Schulte, Salt Lake City; William C. Quinby, Boston; E. H. Martin, Hot Springs, Ark.; Charles M. Harpster, Toledo, Ohio; Lawrence T. Price, Richmond, Va., and Granville MacGowan, Los Angeles.

Wednesday, June 12—Afternoon

Dr. Arthur L. Chute, Boston, read a paper on "Some Cases of Retention of Urine Associated with Defects of the Sacrum, Probably Spina Bifida Occulta." Discussed by Drs. J. A. Gardner, Buffalo; William F. Braasch, Rochester, Minn.; Leland Boogher; St. Louis; H. L. Kretschmer, Chicago; J. Dellinger Barney, Boston, and J. P. O'Neil, Chicago.

The chairman recounted briefly the circumstances attending the death of Dr. Martin Krotoszyner of San Francisco, and appointed as a special committee to prepare suitable obituary resolutions Drs. A. L. Wolbarst, New York; Rufus L. Rigdon, San Francisco, and J. L. Boogher, St. Louis.

The chairman announced that Dr. Arthur L. Chute, Boston, had been selected by the Executive Committee to fill the place of Dr. Hugh Cabot, Boston, on the Executive Committee during this meeting.

Dr. Henry G. Bugbee, New York, read a paper on "Renal Complications of Pregnancy from the Standpoint of the Urologist." Discussed by Drs. Herman L. Kretschmer, Chicago; John R. Caulk, St. Louis; V. D. Lespinasse, Chicago, and A. E. Goldstein, Baltimore.

A paper by Dr. Frank Hinman, San Francisco, was read on "Experimental Hydronephrosis: Repair Following Ureterocystoneostomy in White Rats with Complete Ureteral Obstruction." Discussed by Drs. J. Dellinger Barney, Boston; James A. Gardner, Buffalo; Henry G. Bugbee, New York, and V. D. Lespinasse, Chicago.

Dr. Anders Peterson, Rochester, Minn., read a paper on "Effect on the Kidney and Ureter Following Transplantation into the Bladder." Discussed by Drs. Granville MacGowan, Los Angeles; V. D. Lespinasse, Chicago; Arthur L. Chute, Boston; Charles M. McKenna, Chicago; Bernhard Erdman, Indianapolis, and F. C. Herrick, Cleveland.

Dr. Robert H. Herbst, Chicago, read a paper on "Acquired Stricture of the Lower End of the Ureter." Discussed by V. D. Lespinasse, Chicago; John R. Caulk, St. Louis; William M. Spitzer, Denver; Gustav Kolischer, Chicago; Bernhard Erdman, Indianapolis; J. Dellinger Barney, Boston; Arthur L. Chute, Boston, and William F. Braasch, Rochester, Minn.

Friday, June 14—Morning

Drs. V. G. Vecki, San Francisco; William C. Quinby, Boston, and C. M. Harpster, Toledo, Ohio, were appointed as a nominating committee.

The following officers were elected: chairman, William F. Braasch, Rochester, Minn.; vice chairman, R. L. Rigdon, San Francisco; secretary, E. O. Smith, Cincinnati; delegate, Granville MacGowan, Los Angeles; alternate, H. G. Hamer, Indianapolis.

The address of the chairman, Dr. Edward L. Keyes, Jr., was read.

Dr. Bransford Lewis, St. Louis, read a paper on "New Instruments in Operative Cystoscopy." Discussed by Drs. William F. Braasch, Rochester, Minn., and H. L. Kretschmer, Chicago.

Dr. Oswald S. Lowsley, New York, read a paper on "Surgery and Surgical Pathology of the Human Prostate Gland." Discussed by Drs. H. L. Kretschmer, Chicago; Arthur L. Chute, Boston; V. D. Lespinasse, Chicago; W. G. A. Schulte, Salt Lake City; Bransford Lewis, St. Louis; Gustav Kolischer, Chicago; B. L. Guyatt, Binbrooke, Ont.; Granville MacGowan, Los Angeles; L. E. Schmidt, Chicago, and A. E. Goldstein, Baltimore.

Dr. James A. Gardner, Buffalo, read a paper on "The Silent Prostate." Discussed by Drs. H. L. Kretschmer, Chicago; James B. Cross, Buffalo; J. Dellinger Barney, Boston; Bernhard Erdman, Indianapolis; W. G. Schulte, Salt Lake City; Oswald S. Lowsley, New York; William C. Quinby, Boston; Gustav Kolischer, Chicago; L. E. Schmidt, Chicago; V. D. Lespinasse, Chicago, and C. M. Harpster, Toledo, Ohio.

The committee named to draft resolutions on the death of the vice chairman, Dr. Martin Krotoszyner, San Francisco, reported the following:

Whereas, Dr. Martin Krotoszyner was for many years one of the leading urologists of the Pacific Coast; and

Whereas, He stood high in the affections and respect of his confrères, both at home and throughout the nation, and was recognized as a man of honor, a friend who was loyal, a physician of scientific mind and a co-member of our society who was always enthusiastically ready to further its interests, and

Whereas, On the afternoon of April 20, 1918, while engaged in his office consultations he was wantonly shot to death by a man of disordered mind whose ills he had attempted to heal; and

Whereas, In his death his family lost a loving husband and father, his city was deprived of a public spirited citizen, and the medical profession lost one of its most sincere and untiring members; and

Whereas, Dr. Krotoszyner had been actively interested in the Section on Genito-Urinary Diseases of the American Medical Association since the organization of that Section, and at its meeting one year ago was elected to the office of vice chairman; therefore, be it

Resolved, That we, Fellows of the A. M. A., registered in this section hereby express our feelings of sincere sorrow at his untimely taking away and our sense of loss in his absence from our meeting, and his cooperation in our councils; and

Resolved, That we extend to his wife and family our deepest sympathy in their bereavement, and we assure them that his memory will be cherished by this section as one who stood for the highest and best ideals in medicine; and be it further

Resolved, That these resolutions be spread on the minutes of the section and become a part of its records, and that a copy be forwarded to his family.

The foregoing resolutions were adopted by rising and unanimous vote.

Friday, June 14—Afternoon

Dr. William C. Quinby, Boston, read a paper on "Treatment of Genital Tuberculosis in the Male." Discussed by Drs. J. Dellinger Barney, Boston; J. P. O'Neil, Chicago; James A. Gardner, Buffalo, and Oswald Lowsley, New York.

Dr. J. Dellinger Barney, Boston, read a paper on "Colon Bacillus Infection of the Urinary Tract."

Dr. Louis E. Schmidt, Chicago, read a paper on "The Significance of Bacteriuria."

These two papers were discussed by Drs. H. L. Kretschmer, Chicago; Granville MacGowan, Los Angeles; Oswald S. Lowsley, New York; Bransford Lewis, St. Louis; C. M. McKenna, Chicago, and C. W. Bethune, Buffalo.

Dr. Louis E. Schmidt, Chicago, moved the adoption of the following: That the membership of this section unanimously request that its name be changed to that of the Section on Urology, its scope to be the same as heretofore.

The motion carried by unanimous vote. [Not transmitted to the House of Delegates.]

Dr. Albert E. Goldstein, Baltimore, read a paper on "The Diagnostic and Prognostic Value of Blood Urea in Urology." No discussion.

SECTION ON ORTHOPEDIC SURGERY

Wednesday, June 12—Morning

The section was called to order at 9:05 by the chairman, Dr. Albert H. Freiberg, Cincinnati. Dr. Freiberg made some announcements and appointed, as vice president pro tem., Dr. J. D. Griffith, Kansas City; and as members of the Executive Committee pro tem., Drs. Frank E. Peckham, Providence, R. I.; Arthur Steindler, Iowa City, Iowa, and A. R. Colvin, St. Paul.

Dr. Leo Mayer, New York, read a paper on "Tendon Operation Technic." Discussed by Drs. Arthur Steindler, Iowa City, Iowa; E. H. Smith, San Francisco; C. M. Jacobs, Chicago; M. A. Bernstein, Kenosha, Wis., and Leo Mayer, New York.

Dr. Walter G. Stern, Cleveland, read a paper by himself and Dr. M. E. Blahd, Cleveland, on "Cerebral Spastic Paraplegia." Discussed by Drs. George B. Packard, Denver; E. H. Smith, San Francisco; John Ridlon, Chicago, and Walter G. Stern, Cleveland.

Dr. Frank E. Peckham, Providence, R. I., read a paper on "A Further Report of the Operation for Stabilizing the Foot and Ankle in Poliomyelitis." Discussed by Drs. Walter G. Stern, Cleveland, and Frank E. Packham, Providence.

Dr. Melvin S. Henderson, Rochester, Minn., read a paper on "Loose Bodies in the Elbow Joint." Discussed by Drs. W. C. Campbell, Memphis, Tenn.; A. R. Colvin, St. Paul; A. H. Freiberg, Cincinnati; Arthur Steindler, Iowa City, Iowa; Leo Mayer, New York; C. A. Parker, Chicago; J. D. Griffith, Kansas City, Mo., and Melvin S. Henderson, Rochester, Minn.

Dr. Arthur Steindler, Iowa City, Iowa, read a paper on "Orthopedic Operations on the Hand." Discussed by Drs. John L. Porter, Chicago; J. P. Lord, Omaha; Melvin S. Henderson, Rochester, Minn.; C. M. Jacobs, Chicago, and Arthur Steindler, Iowa City, Iowa.

Dr. W. Barnett Owen, Louisville, Ky., read a paper on "Efficient Support for Sacro-Iliac Relaxation." Discussed by Drs. F. J. Gaenslen, Milwaukee; C. A. Parker, Chicago; J. P. Lord, Omaha; John L. Porter, Chicago; E. H. Smith, San Francisco, and W. Barnett Owen, Louisville, Ky.

Wednesday, June 12—Afternoon

A joint meeting was held with the Section on Preventive Medicine and Public Health.

The meeting was called to order at 2:10 by Dr. A. H. Freiberg, Cincinnati, chairman of the Section on Orthopedic Surgery. Dr. Freiberg read an announcement about draft board managers, and then surrendered the Chair to Dr. J. D. Griffith, Kansas City, Mo.

Dr. A. H. Freiberg, Cincinnati, read the chairman's address, entitled, "Military and Industrial Orthopedic Surgery."

Dr. Charles G. Farnum, Peoria, Ill., read a paper on "Modern Industrial Medicine and Surgery."

Dr. Clarence D. Selby, Toledo, Ohio, read a paper on "Conserving Industrial Man Power."

These two papers were discussed by Drs. J. W. Schereschewsky, Washington, D. C.; Charles G. Farnum, Peoria, Ill., and Clarence D. Selby, Toledo, Ohio.

Dr. Francis D. Patterson, Harrisburg, Pa., read a paper on "Reconstruction Work in Industrial and Military Life." Discussed by Drs. C. G. Farnum, Peoria, Ill.; O. P. Geier, Cincinnati; J. D. Griffith, Kansas City, Mo.; W. G. Stern, Cleveland; E. P. S. Miller, Chicago, and F. D. Patterson, Harrisburg, Pa.

Mr. Charles S. Andrus, Chicago, Ill., read a paper on "Responsibility of the Industrial Board and the Influence of the Medical Examiner." Discussed by Dr. Wilmer Krusen, Philadelphia, and Mr. C. S. Andrus, Chicago.

Friday, June 14—Morning

The meeting was called to order at 9:05 by the chairman, Dr. A. H. Freiberg, Cincinnati.

The following officers were elected: chairman, Dr. Emil S. Geist, Minneapolis; vice chairman, Dr. Benjamin P. Farrell, New York; Executive Committee, Dr. Russell A. Hibbs, New York, chairman; Dr. A. H. Freiberg, Cincinnati, and Dr. E. W. Ryerson, Chicago; delegate, Dr. John Ridlon, Chicago. The secretary, Dr. H. B. Thomas, Chicago, retains his office for two more years.

A letter from Col. Sir Robert Jones of London was read, and a motion was carried directing the secretary to write to Colonel Jones expressing appreciation and regard.

The executive session adjourned at 9:15, and the scientific program was resumed.

Dr. Robert B. Cofield, Cincinnati, read a paper on "Disinfection of the Knee Joint." Discussed by Drs. C. A. Parker, Chicago; J. P. Lord, Omaha; A. H. Freiberg, Cincinnati, and Robert B. Cofield, Cincinnati.

Dr. Leo Mayer, New York, showed the slides belonging to his paper on "Tendon Operation Technic," which was read on Wednesday morning. Discussed by Drs. A. H. Freiberg, Cincinnati, and Leo Mayer, New York.

Dr. Russell A. Hibbs, New York, presented a paper on "Final Report of Operations for Pott's Disease." Discussed by Drs. C. M. Jacobs, Chicago; W. C. Campbell, Memphis, Tenn.; F. J. Gaenslen, Milwaukee; H. B. Thomas, Chicago; Benjamin P. Farrell, New York, and R. A. Hibbs, New York.

Dr. David Silver, Pittsburgh, read a paper on "Problem of the Artificial Arm." Discussed by Drs. John Ridlon, Chicago; J. P. Lord, Omaha; Arthur Steindler, Iowa City, Iowa; Leo Mayer, New York; S. C. Baldwin, Salt Lake City, and David Silver, Pittsburgh.

Dr. Charles R. McClure, Portland, Ore., read a paper on "Isolated Disease of the Scaphoid." Discussed by Drs. W. C. Campbell, Memphis; S. C. Baldwin, Salt Lake City, and Charles R. McClure, Portland, Ore.

Dr. Robert Emmett Farr, Minneapolis, read a paper on "Illustrations and Demonstration of Bone-Holding Forceps." No discussion.

The chairman appointed Drs. J. P. Lord, Omaha, and R. B. Cofield, Cincinnati, as members of the executive committee to act in the places of Drs. A. R. Colvin and Frank E. Peckham.

SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

Wednesday, June 12—Morning

The meeting was called to order at 9 o'clock by the chairman, Dr. Anthony Bassler, New York.

Dr. Anthony Bassler, New York, read the chairman's address.

Dr. Charles D. Aaron, Detroit, read a paper on "A Simplified Method of Aspirating Gastric Contents in Hypersensitive Patients." Discussed by Drs. M. H. Mack, Chicago; J. M. Rector, Columbus, Ohio, and J. Russell Verbrycke, Jr., Washington, D. C.

Dr. William M. Beach, Pittsburgh, read a paper on "The Subnormal Colon." Discussed by Drs. D. H. Murray, Syracuse, N. Y.; E. L. Eggleston, Battle Creek, Mich.; William H. Stauffer, St. Louis, and Nathan Rosewater, Cleveland.

Dr. Dwight Henderson Murray, Syracuse, N. Y., read a paper on "A Résumé of Eight Years' Original Research Work in the Etiology and Treatment of Pruritus Ani." Discussed by Drs. J. M. Frick, Toledo, Ohio; James A. Duncan, Toledo, Ohio; Thomas Charles Martin, Washington, D. C., and Anthony Bassler, New York.

Dr. Sidney K. Simon, New Orleans, read a paper on "The Comparative Value of Crude Ipecac and Its Alkaloids in the Treatment of Amebiasis." Discussed by Drs. Frank Smithies, Chicago; Hugo A. Freund, Detroit, and Horace W. Soper, St. Louis.

The paper of Dr. Max Einhorn, New York, on "The Importance of Detailed Examination of Drafted Men with Regard to Their Ability to Be Soldiers," was read. No discussion.

Drs. Dwight Henderson Murray, Syracuse, N. Y., William H. Stauffer, St. Louis, and William Van Valzah Hayes, New York, were appointed by the chair as a nominating committee.

Wednesday, June 12—Afternoon

The meeting was called to order at 2 o'clock by the chairman.

The following officers were elected: chairman, Dr. William M. Beach, Pittsburgh; vice chairman, Dr. Frank Smithies, Chicago; secretary, Dr. Horace W. Soper, St. Louis; delegate, Dr. Willian Van Valzah Hayes, New York; alternate, Dr. T. Chittenden Hill, Boston; executive committee, Drs. Charles G. Stockton, Buffalo; Dwight H. Murray, Syracuse, N. Y., and Anthony Bassler, New York.

Dr. Frank Smithies, Chicago, read a paper on "Pericholecystitic Adhesions: Their Importance and Clinical Recognition." Discussed by Drs. Robert T. Morris, New York; G. A. Friedman, New York; Mary E. Dunning Rose, New York; William Van Valzah Hayes, New York, and Roland Hazen, Paris, Ill.

Dr. G. A. Friedman, New York, read a paper on "The Probable Endocrinic Origin of Peptic Ulcer." Discussed by Drs. Frank C. Mann, Rochester, N. Y.; V. A. LaPenta, Indianapolis; Betram W. Sippy, Chicago, and Martin E. Rehfuss, Philadelphia.

Dr. Martin E. Rehfuss, Philadelphia, read a paper on "The Possibilities of Fractional Gastric Analysis." Discussed by Drs. William Van Valzah Hayes, New York; Frank Smithies, Chicago, and A. F. R. Andresen, Brooklyn.

Dr. Thomas Charles Martin, Washington, D. C., read a paper on "An Operation for Internal Hemorrhoids under Local Anesthesia." Discussed by Drs. Marvin H. Smith, Jacksonville, Fla.; William M. Beach, Pittsburgh; J. Rawson Pennington, Chicago; Dwight H. Murray, Syracuse, N. Y.; William H. Stauffer, St. Louis, and Charles D. Aaron, Detroit.

Friday, June 14—Morning

The meeting was called to order by the chairman.

Dr. Harry B. Eisberg, New York, read a paper on "Intestinal Obstruction: Continued Studies from Surgical Research Laboratory, New York University." Discussed by Drs. Dwight Henderson Murray, Syracuse, N. Y., and James J. Moorehead, Chicago.

Dr. J. Rawson Pennington, Chicago, read a paper on "The End-Results of Operations for Cancer of the Rectum, with Suggestions for Improving Them." Discussed by Drs. Dwight Henderson Murray, Syracuse, N. Y; William M. Beach, Pittsburgh; Charles J. Drueck, Chicago, and George E. Pfahler, Philadelphia.

Dr. George E. Pfahler, Philadelphia, read a paper on "The Importance of Complete Roentgen Study of the Gastro-Intestinal Tract and Gallbladder in All Obscure Abdominal Cases." Discussed by Drs. Bertram W. Sippy, Chicago; William Van Valzah Hayes, New York; Aloys Heinen, Chicago; J. M. Rector, Columbus, Ohio; John Guttman, New York, and Horace W. Soper, St. Louis.

WAR TIME DIFFICULTIES IN PRACTICAL DIETETICS

The new adjustments of food conditions thus far experienced in American homes have been brought about by voluntary effort and economic necessities rather than by governmental procedure. There has been no attempt at compulsory rationing, such as has been attempted abroad. "The Food Administration," said Herbert C. Hoover in a recent address, "has not taken the attitude of the general in command giving orders. Our attitude to the American public has been consistent, that we should ask for service, that we should ask for self-sacrifice, that we should tell in a clear and direct way the why and wherefore of every request. . . . The Food Administration has been founded on voluntary effort. We have no desire to depart from this idea, but if we are to accomplish our purpose it must be accomplished by voluntary effort."

Even an honor system of voluntary rationing requires the application of intelligence in the readjustment of dietaries occasioned by the exclusion or reduction of certain items in the diet. The difficulties are not diminished by the fact, already demonstrated by a single year's experience, that the conditions of supply may change from month to month in such a way as to require new plans. We must almost adjust ourselves, like an army in the field, to the day's orders. If the more intelligent classes of our communities are finding that this novel necessity taxes their ingenuity, how much greater must be the perplexity among those groups less competent to meet new situations with skill and forethought. How can a solution be found?

These comments have received added force from the experience that our English allies have acquired in the conduct of the large number of hostels where, under governmental patronage, great numbers of munition workers are now fed. Catering according to custom is an impossibility in a war time canteen. The problem of satisfying the boarder and obeying the mandates of the food administration at the same time has tried the matrons set to the tasks. The crux of the situation has been clearly stated by Miss Chrystal[1] of the Welfare and Health Section, Ministry of Munitions: "The best use of substitutes and the most economical use of food generally are matters which require a great deal of skill, and which may be beyond the powers of ordinary English cooks."

Such perplexities are assuredly not negligible. Our military authorities have begun to realize the true value of a trained army cook; the civilian armies must also be provided for. Some of the difficulties encountered in the new kind of service that hostels represent are worth mentioning because they have both psychologic and physiologic import in nutrition. Variety affects efficiency both physically in relation to digestion and psychologically. Sameness is apt to characterize institutional food, and it is not surprising that hostel catering should have the same fault. Detailed observation has led inspectors to believe that one of the secrets of successful hostel management lies in preserving the tenants' interest in their meals. It is a common experience in hostels that the nerve strain of heavy munition work produces in women a disposition to be difficult about food, and where there is little discontent it is generally found that variety of food is studied. The great difficulty is that, although monotony is resented, the workers are conservative and suspect new dishes.

The munition worker is not unlike the patient that demands a diet list from his physician. Geographic and racial peculiarities and dietary customs offer almost insurmountable obstacles to many rational innovations. Thus one hostel inspector reports that "potato dishes are being tried with considerable success. Maize has been found to be unpopular and indigestible. Suet puddings and rolls are thought by the workers to be sustaining." Not only the proper selection and cooking of food, but also suitable service is indispensable to success. And the problem of waste looms up larger as the food stores become smaller.

In the face of such emergencies it behooves the medical profession to welcome and encourage in this country the growth of a movement that is destined to bring help and stimulus in meeting these problems of the art of living. Home economics has too long been looked on as a fad. Rule of thumb methods are no longer synonymous with household arts. Witness the speedy success with which substitutive cereals have been employed in cookery throughout the United States within the past few months. From the primary schools to the colleges for women our girls are being taught the dignity of home economics and the underlying sciences. Our profession is all too slow in realizing what these newer forms of theoretical and vocational education actually are destined to mean, not only to the hospital or institutional dietitian and to the trained nurse, but also to the nation at large. Let us dignify the art of dietetics.

---

THE ORIGIN OF COLOSTRUM

The milk that female mammals secrete during the first few days after parturition, at the beginning of their period of lactation, is quite different in composition from the fluid produced at a later stage. It is known under the name of colostrum, and the colostral characteristics persist for varying periods in different species. Colostrum is a more viscid fluid than the later milk. It is richer in proteins, particularly lactalbumin, and total solids; unlike ordinary milk, it may even coagulate on being heated. Colostrum contains many cells designated as milk corpuscles, which contain nuclear material, whereas later milk is essentially free from such products. Regarding the fat content, the statistics are somewhat uncertain; but it has been reported that the colostral fat has a higher melting point and more of the lipoids, cholesterol and lecithin, than has ordinary milk.

Many students of the value of milk as a nutrient have placed emphasis on the importance of colostrum in the nutrition of the young. They believe that, owing to its comparative richness in the different types of foodstuffs, colostrum helps to avert considerable declines in body weight and retardation of growth during the earliest period of infancy. For example, in Dr. Lane-Claypon's elaborate survey of milk and its hygienic relations, the following statement appears: There is no doubt that colostrum is of primary importance to the young animal, and there is no way of replacing it. An infant deprived of the colostrum of its mother must endeavor, not always with success, to make up later the disadvantage under which it has labored at the start.[1] When it is added further that colostrum is supposed by some to have a laxative effect, the foundation for the belief of the special value of this secretory product for the first few feedings of the newly born will better be understood.

Other investigators, on the other hand, have not accepted this purely teleological explanation for the occurrence of colostrum. They believe that this product is the temporary result of the imperfect activity of the mammary glands when they start their functioning. The peculiar composition of the fluid, with its comparative richness in cellular constituents, is regarded as a natural result of the washing out of ducts hitherto inactive. Not until the pent up cell débris is discharged does a standardized type of secretion ensue, on this hypothesis. A recent decidedly unique observation, made by Hill[2] at the Maryland Agricultural Experiment Station, may help to throw light on the real significance and origin of colostrum. A 4 months' old virgin doe kid spontaneously commenced to secrete milk having all characteristics, properties and chemical composition of the milk secreted by its mother and other goats under observation. At no time, from the earliest secretion of milk, was there any colostrum secreted. This would indicate that the secretion of colostrum is associated with and possibly is produced by the cessation of pregnancy, and may not occur in lactation not associated with pregnancy.

A BRITISH VIEW OF THE AMERICAN MEDICAL ASSOCIATION'S WAR ACTIVITIES

The *British Medical Journal* (June 1) comments on the editorials which appeared in THE JOURNAL, April 20 and 27, relative to the call of Surgeon-General Gorgas for five thousand more medical officers. Our confrère observes that the American Medical Association offered its services to the government at the time the United States entered the war just as did the British Medical Association at the beginning of the conflict, and intimates that we are going through their experience when we call only for a sufficient number of volunteers to meet immediate needs. As to this, of course the Surgeon-General is not endeavoring to supply the immediate needs, because these have been supplied; what the Surgeon-General desires is to prepare for future needs. Incidentally we might add that this need may not be far distant, judging from the outlook for rapid enlargement of our National Army.

Referring to the call of our Surgeon-General, the *British Medical Journal* says: "The American Medical Association, like the British Medical Association, has a War Commitee which is taking up this call with energy and enthusiasm. The Surgeon-General desires that the five thousand shall be secured without serious hardship to any community, manufacturing concern or other civil activity, and consequently the American Medical Association has begun to investigate the conditions in all parts of the country so as to produce a survey which will 'provide a basis for accurate, intelligent, cooperative effort.'" It goes on to say that our War Committee, as did theirs, deliberated on the advisability of calling for a voluntary draft, which would mean that every physician in active practice would volunteer as a member of the Medical Reserve Corps and be subject to call. "The American Medical Association has deemed this extreme measure [that is, voluntary draft] unnecessary for the present at least. The organization of such a scheme would have afforded excellent training for the work the Association will have to face if ever it becomes necessary in America to pass a military service act in any way comparable to that which has been found necessary in Great Britain." However, attention is called to the relatively large number of medical practitioners in America as compared with the number in Great Britain.

---

[2] Hill, R. L.: The Analysis of Milk Secreted by a Suckling Doe Kid, Jour. Biol. Chem., 1918, 33, 391.

Quoting our statement that "the time has come for every medical man under 55 years of age who is physically qualified to consider seriously for himself the question of his duty to his government," the *British Medical Journal* suggests that "no individual practitioner can possibly judge for himself the medical needs of the community in which he practices or the hardship which he himself will suffer." This fact is being recognized in the work being done by the state and county organizations. It is appreciated that even the county society, except where the county includes large centers of population and consequently a large number of physicians, is seldom qualified to pass judicially on the question as to whether such and such a man could be spared or should offer his services. The plan now being tested out in some of the Councilor Districts of Nebraska is more likely to result in judicious conservative selection, with personal bias eliminated. There, as mentioned elsewhere in this issue, it is proposed that a committee composed of a representative from each county society in the Councilor District, with the councilor of the district acting as chairman, shall indicate those who should apply for commission and in what order, so that the quota assigned to that district will be available.

WAR GASES AND ANTIVIVISECTIONISTS

According to investigations in progress on animals at the Rockefeller Institute for Medical Research,[1] some degree of analgesia may be produced by at least three widely different war gases—chlorin, phosgen and dimethylsulphate[2]—and may perhaps be a property of most gases usable for military purposes. Auer, who has conducted the experiments with dimethylsulphate, has reported that in animals gassed with fumes of this compound a strong generalized analgesia is observed within a few hours after exposure to the fumes, which reaches a high degree within twenty-four hours. If the animal survives, the analgesia may still be well marked six months afterward. Furthermore, we are assured that in such animals severe operations may be performed without any anesthetic, the operation eliciting no indications or only slight indications of pain. If these experimental observations find their counterpart in the experience of the battlefield, the analgesic property may be utilizable in gassed soldiers who are also wounded and require surgical intervention.

A further possible practical outcome of the animal experiments with dimethylsulphate fumes relates to the necropsy findings of localized pulmonary edema as a result of gassing.[3] The edema rarely involves the whole lung, only a certain lobe or portions of a lobe showing a striking degree of pulmonary edema. It is by no means infrequent to find one lobe fairly saturated, while the rest of the entire lung tissue is practically free from fluid.

According to Auer, this condition is due apparently to the combination of a partial or complete stenosis of a bronchus or bronchiole with inspiratory dyspnea. A marked inflammation of the respiratory passages with pseudodiphtheritic membrane formation may occur locally. Therefore during each inspiration, which is slow, labored and prolonged in the gassed animal, the capillaries of the alveolar walls are subjected to an aspirating action which facilitates or initiates the passage of a transudate into the alveolar spaces. The production of this transudate is probably also aided by a local damage of the alveolar epithelium which the war gas produces. So far as such conditions may be found in gassed soldiers, it is suggested that all inspiratory dyspnea should be ameliorated as much as possible, by tracheotomy and artificial respiration if necessary, aiming by this means to ward off pulmonary edema.

And in the meantime, while patient investigators are trying their best by animal experimentation to kindle a spark of hope for the unfortunate victims of a fiendish mode of warfare, the complacent stay-at-home "antivivisectionists" and their mouthpiece—*Life*—are doing their worst to extinguish it. Shall humanity tolerate such traitors to its cause? Speaking of this "menace of unreason as applied to problems concerning hygienic and moral measures that affect the rights of the individual and society," Joseph Jastrow, professor of psychology in the University of Wisconsin, says in a recent work on "The Psychology of Conviction":

> Upon the basis of a similarly inspired opposition—and one quite as unintelligent—we have the anti-vaccinationists; and reaching to higher circles where prejudices, like other beliefs, acquire a more moralized statement, the antivivisectionists. It is gratifying to record that American conditions up to the present have not been as favorably disposed toward this propaganda of unreason as to others; yet it is possible to cite the well-known fact that a popular periodical, which ministers to the relaxations of life and stands for that sanity of view which a sense of humor so notably confers, which circulates among the more cultivated classes of society, incessantly preaches an ignorant and false crusade, brutally misrepresents the noble army of experts who are carrying the triumphs of science into the field of deepest concern to human interests, criticizes without authority and ignores the open records of achievement; while in the main stultifying its own position, it unquestionably fosters the cause of prejudice.

Current Comment

INTERN TRAINING AND STANDARDIZING OF HOSPITALS

The medical graduate who has spent a year or more as an intern in a good hospital is acknowledged to be so much better prepared for his professional career than the man without it, that this internship should be required of all medical students. The making of such a requirement rests with either the medical schools or the state licensing boards. Already eight medical schools have made the intern year mandatory for the degree, and seven state licensing boards have made it an essential qualification for a license. As the intern service becomes an essential part of the training of medical students—a requirement rather than an optional, extramural course—its character and content must be subject to regulation. Each school or state board which adopts this requirement must decide what are the essential qualifications whereby a hospital can provide a satisfactory intern training, and must prepare a list of the hospitals which, in its judgment, possess these qualifications and whose internships it will recognize. The standardization of intern training and the classification of hospitals on the basis of their facilities for intern instruction have been a part of the program of the Council on Medical Education of the American Medical Association since it first took up the work of improving the standards of medical education. The Council has already made two surveys of hospitals and published two editions of a list of those considered qualified to provide acceptable internships. It is now making a third survey and has just sent out a questionnaire to all of the hospitals of the country reporting interns. In cooperation with the Council, the state medical associations are appointing hospital committees to act in an advisory capacity as the survey progresses. Besides the collecting of this information concerning the hospitals which provide internships, and as conditions may require it, it is proposed to make inspections of certain hospitals. In this standardization of hospitals, special emphasis will be laid on the qualifications of the hospital staff, the adequacy of its equipment for modern, scientific diagnostic and therapeutic procedure, the work required of its interns, and the supervision given to that work. It is on these points chiefly that the value of the intern's training depends. The intern year must become of equal rank educationally with the previous four years of the student's medical course. The staffs of hospitals should look on their relation to the intern as that of teacher to student. Some hospitals and their staffs have long felt this responsibility and have given their interns training of high quality. In the majority, however, there will need to be something like a revolution in the hospital's conception of its duty to the intern. The hospital must recognize that while primarily it secures the aid of trained interns so as to provide adequate and proper care for the sick, and thus is better able to fulfil its duty and responsibility to the community, actually the hospital secures the services of these interns without expense because it is presumed to give the student a quid pro quo in the form of advanced clinical instruction and experience.

THE RESPONSE OF THE MEDICAL PROFESSION

We understand that during the four weeks since the publication of the "Honor Roll" in The Journal (June 1), practically 2,775 physicians have made application for commission in the Medical Reserve Corps and a little less than 200 for commission in the U. S. Naval Reserve Force. Of course, a certain percentage of these will be unable to qualify. However, it shows how well the medical profession is appreciating its responsibility. The question with the large majority of physcians is, Where can I best render service? Apparently many physicians have found the correct answer.

THE HONOR ROLL

May we again call the attention of those who desire to keep the "Honor Roll" (The Journal, June 1) complete and up to date to the fact that this may be done by adding to it the names of those accepting commissions which now appear in The Journal each week. In the present issue the names of 199 physicians are recorded as having accepted commissions in the Medical Reserve Corps of the Army and 180 as having accepted commissions in the U. S. Naval Reserve Force.

ONE FORM OF VOLUNTARY SELECTIVE CONSCRIPTION OF PHYSICIANS

The problem of supplying the required number of officers for the Medical Reserve Corps, without working "serious hardships on any community, manufacturing concern, or any other civil activity," is being solved, not by any hard and fast or harsh plan, and in applying it all over the country, but by simply keeping the principle in mind and applying it where and in the manner best suited to the conditions that exist in the community. A plan workable in one state may be impracticable in another. What may be an ideal scheme in Kansas or Nebraska might be impossible in New York or New Jersey. Among those being put to a practical test is that proposed by Johnson County, Nebraska. The members of this society have agreed that those under fifty-five years of age will apply for commission in the Army or Navy and will agree to accept the commission if granted. The action of this individual society, however, was taken with the understanding that it should be obligatory only in the event of the remaining counties of the Councilor District adopting it. This, as we understand, has been done by all the counties in the District. The plan outlined calls for a committee composed of one representative from each of the county societies of the District, with the Councilor of the District acting as chairman. This committee, therefore, represents not a small community, but a definite and sufficiently wide territory to eliminate personal prejudice or personal influence; at the same time it has a knowledge of the actual conditions existing in every part of its territory. The plan is really carrying out the principles underlying the selective service regulations. It is an ideal voluntary conscription of the medical profession by itself, one that recognizes the needs of the community and the social condition of the individual practitioner.

Medical Mobilization and the War

Personnel Changes in Expeditionary Forces

Lieut.-Col. George P. Peed, M. C., U. S. Army, who has been in command of American Red Cross Military Hospital No. 1, Neuilly, France, and who later was made medical director of all American hospitals in Paris, has been assigned to new duties involving the organization of other American military hospitals. He has been replaced as military director by Lieut.-Col. Ernest G. Bingham, M. C., U. S. Army, who will correlate the work of all the military hospitals in Paris. Colonel Bingham has been succeeded as commanding officer of the hospital in Neuilly by Major James P. Hutchinson, M. R. C., U. S. Army, medical and surgical director of the institution.

Additions and Improvements to Hospital Buildings at Army Camps

Hospitals, convalescent barracks, infirmaries and nurses' quarters added to the hospital establishment of the Army in this country during the past six months, and in the course of construction by the Construction Division of the Army, have been estimated to cost $25,173,417.55. The following construction has been completed: A 500-bed addition to both of the hospitals at Camp Gordon and Camp Dodge, including officers' and nurses' quarters, at a cost of $550,000; additional two-story ward convalescent barracks at Army and National Guard base hospitals, with a capacity of from 300 to 900 beds, with umbrella sheds connecting them, at a cost of $9,179,000; two regimental infirmaries at each National Army cantonment and one regimental infirmary at each National Guard camp and remount depot, at a cost of about $344,000; dental infirmary operating building at National Guard camps and National Army cantonments, at an estimated cost of $912,000; a dental infirmary and an eye, ear, nose, and throat clinic at each National Guard camp at a cost of $139,200; an additional 1,500-bed hospital at Camp Merritt, at a cost of $1,115,000; a venereal tent hospital and additional hospital buildings at Camp Stuart, at a cost of $220,000; a 500-bed hospital at the engineers' training camp at Belvoir, at a cost of $1,125,000. It has been necessary also to install steam-cooking equipment in the general kitchens of hospitals on account of increased bed accommodations in National Army cantonments and National Guard camps; there have also been constructed nurses' quarters and additions to officers' quarters at a cost approximating $1,000,000, together with wards and isolation wards for the care of female nurses. These wards are also being established at Camps Merritt, Stuart, Humphreys, Johnston, and General Hospitals No. 2 at Fort McHenry (Md.), No. 6 at Fort McPherson, No. 8 at Otisville (N. Y.), and No. 10 at Fox Hills (N.Y.), at an estimated cost of $181,350. Sanitary accommodations have also been installed in the wards at the hospitals at National Army cantonments. Automatic fire-alarm systems have been installed in the hospitals of the National Army and National Guard camps, and at Camps Merritt, Stuart, Funston, Walter Reed General Hospital, and General Hospital No. 1 at New York, at an estimated cost of $1,200,000. Screening is being installed in all hospitals, and steam disinfectors at the National Army and National Guard camps, as w ell as at Camps Johnston, Stuart, Merritt, and at General Hospital No. 3, Colonia, N. J., at a cost of $69,721.

The following construction is in progress at the United States Army general hospitals: Additional hospital buildings in tile at the Walter Reed General Hospital, Washington, D. C., at a cost of $733,400; a 1,000-bed tuberculosis hospital at Denver, at a cost of $1,720,000; a 1,000-bed hospital for the same purpose at Azalea, N. C., at an approximate cost of $1,325,000; a 120-bed hospital at Norfolk, Va., at an approximate cost of $205,900; a 1,500-bed hospital at United States General Hospital No. 3, Colonia, N. J.; at an estimated cost of $1,632,000; additional two-story nurses' quarters, accommodating 150 nurses, at United States General Hospital No. 6, Fort McPherson, Ga., at an approximate cost of $88,700; a hospital for the care of blind soldiers at Rolan Park, Md., to be known as the United States General Hospital No. 7, at an estimated cost of $140,446; a tuberculosis hospital with a capacity for 650 patients at General Hospital No. 8, Otisville, N. Y., at an estimated cost of $957,000; a hospital which will care for 1,762 patients at Fox Hills, N. Y., at a cost of $2,075,000; a two-story convalescent hospital at Fort Oglethorpe, Ga., at General Hospital No. 14, accommodating about 1,000 patients, at an estimated cost of $202,200. The Lakewood Hotel and "Florence in the Pines," at Lakewood, N. J., have been leased for hospital purposes at an annual rental of $58,500.

Changes in Personnel of British Army Medical Service in France

The Secretary of the War Office announces the retirement of Lieut.-Gen. Sir Arthur T. Sloggett as Director General, due to the fact that he has completed the period of his appointment and passed the age limit for service. Sir Arthur Sloggett is a Fellow of King's College, London, and began his army career in 1881; in 1884 he served on the Indian frontier; in 1896 he was senior medical officer of the British troops with the Dongola Expeditionary Force. He served in the Sudan in 1897-1898 in which campaign he was shot through the chest in the cardiac region; on his recovery he rendered distinguished service in South Africa. He then became P. M. O. of Home and London Districts, and of the Sixth Division in India, becoming Director-General of Medical Services in India in 1911, and Director-General A. M. S. at the War Office on June 1, 1914. He has been in France as Director-General Medical Services of the British armies in that country since October, 1914. His conspicuous success has been due to a great extent to his use of scientific methods and to his sympathy with the views of the civilian physicians who have served under him.

Sir Arthur Sloggett is to be succeeded by Major-General C. H. Burtchaell. Major-General Burtchaell graduated from the University of Dublin in 1889, entering the army in 1891. He served in the North-Western Frontier campaign in India in 1897-1898, being present at all the principal battles, and throughout the South African war, and in 1902 was appointed principal medical officer to the South African Constabulary; in 1905 he rejoined the army. In 1907 he organized the experimental scheme of sanitary training for fighting troops later adopted for the army. In 1908 he became director of the medical service work of the first medical tour held in the British Army, in 1910 becoming Assistant Director-General, Army Medical Services, War Office, having served as Assistant Director-General Medical Services in France since October, 1914. He was promoted to colonel in March, 1915, and to temporary Surgeon-General in October, 1917. He has distinguished himself in the present war, being mentioned seven times in dispatches and being awarded the C. B., the C. M. G., and the Legion of Honour. He is especially esteemed by the Dominion forces, having been associated with them for three years in the South African campaign.

To Hoboken, N. J., for duty, from Fort Oglethorpe, *Lieuts.* ALEXANDER W. SPEARS, Grindstone; CHARLES H. WOLFE, Pittsburgh; from New York City, Major EVAN W. *MEREDITH,* Pittsburgh.

T[illegible] r duty, from Camp Leach, Lieut. MICHAEL M. [illegible]

T[illegible] for duty, Lieuts. WILLIAM D. STROUD, Philadelphia; MORRIS [illegible]IRSHMAN, Pittsburgh; from Camp Gordon, Lieut. LESLIE N. GAY, Shamokin.

To Lonoke, Ark., Eberts Field, for duty, from Camp Jackson, Capt. HARRISON A. GREAVES, Philadelphia.

To New York City, Neurological Institute, for intensive training, Lieuts. HENRY B. MIKELBERY, ABRAHAM M. ORNSTEIN, Philadelphia.

To Pittsburgh, Pa., Carnegie Building, for instruction, and on completion *to Camp Sherman*, Chillicothe, Ohio, base hospital, Lieut. GORSHON GINSBURG, Philadelphia.

To report to the commanding general, Philippine Department, for duty, from Camp Shelby, Capt. WILLIAM RUOFF, Philadelphia.

To Rochester, Minn., Mayo Clinic, for instruction, and on completion *to Camp Dodge*, Des Moines, Iowa, base hospital, from Fort Oglethorpe, Capt. HARRY A. SPANGLER, Carlisle.

To Rockefeller Institute for instruction, and on completion *to Fort Oglethorpe*, from New York City, Lieut. JOHN D. DONNELLY, Philadelphia. For instruction in laboratory work, from Camp Logan, Lieut. THEODORE MELNICK, Philadelphia. For instruction in the treatment of infected wounds, and on completion *to Camp Meade*, Annapolis Junction, Md., base hospital, Lieut. EDWARD S. DILLON, Philadelphia. On completion *to Walter Reed General Hospital* for temporary duty, Lieut. EDWARD N. HAGIN, Sharon.

To West Lafayette, Ind., Purdue University, to make physical examinations and give medical attention to the drafted men enrolled at this institution, and on completion *to his proper station*, from Fort Oglethorpe, Capt. HARRY BRADY, Masontown.

Honorably discharged on account of physical disability existing prior to entrance into the service, Lieut. ADOLPH H. FRIEDMAN, Philadelphia.

Porto Rico

To Camp Las Casas, San Juan, P. R., for duty, Capt. ALBERT G. MEHRHOF, Guayama; Lieut. LOUIS P. DAME, San Juan; from Camp Colt, Lieut. MANUEL DIAZ GARCIS, Barceloneta.

Rhode Island

To Fort Oglethorpe for instruction, Lieut. THOMAS S. FLYNN, Woonsocket.

To Rockefeller Institute for instruction in laboratory work, and on completion *to Army Medical School* for duty, Capt. WILLIAM G. DWINNELL, Providence.

The following order has been revoked: *To Cape May, N. J.*, base hospital, Lieut. FREDERICK N. BIGELOW, Providence.

South Carolina

To Camp [illegible], S. C., for duty, Lieut. RALPH K. FOSTER. [illegible] Fort Myer, Lieut. WILLIAM E. WHITESIDE, [illegible]

To Fort Oglethorpe for instruction, Lieut. JAMES E. DOUGLASS, Winnsboro.

South Dakota

To Boston, Mass., Harvard Graduate School of Medicine, for instruction, from Fort Riley, Lieut. LAWRENCE J. BROOKMAN, Vermilion.

To Camp Custer, Battle Creek, Mich., base hospital, from Milwaukee, Lieut. CARL N. HARRIS, Wilmot.

To Rochester, Minn., Mayo Clinic, for instruction, and on completion *to Camp Grant*, Rockford, Ill., base hospital, Lieut. ARTHUR F. GROVE, Dell Rapids.

Tennessee

To Boston, Mass., Franklin Union Institute, for duty, from Fort Oglethorpe, Capt. THOMAS E. P. CHAMBERS, Cleveland.

To Camp Joseph E. Johnston, Jacksonville, Fla., for duty, from Fort Oglethorpe, Lieut. YOURA S. BROWN, Halls.

To Camp Lee, Petersburg, Va., for duty, Lieut. BENJAMIN J. COGDILL, Vestal; from Fort Oglethorpe, Lieut. JOHN H. HUFF, Seviersville.

To Camp Pike, Little Rock, Ark., with the board examining the command for cardiovascular diseases, Capt. OVAL N. BRYAN, Nashville.

To Camp Wadsworth, Spartanburg, S. C., for duty, Lieuts. LEROY S. McMULLEN, Knoxville; WALTER L. BOSWELL, Macon; from Fort Oglethorpe, Lieut. CHESTER A. SKELTON, St. Eline.

To Fort Oglethorpe for instruction, Capt. JOHN J. McSWAIN, Paris; Lieuts. SPENCER B. McCLARY, Benton; GEORGE T. WILHEM, Memphis.

To Indianapolis, Ind., to give medical attention to drafted men, from Fort Oglethorpe, Lieut. WILLIAM T. BUCK, Henderson.

To Waynesville, N. C., for duty, from Camp Sevier, Lieut. JOHN O. WOODS, Newport.

Texas

To Boston, Mass., Harvard Graduate School of Medicine, for instruction, *from Fort Oglethorpe, Capt.* HOWARD R. DUDGEON, *Waco.*

To Camp Dix, Wrightstown, N. J., for duty, from Camp Logan, Capt. WALTER C. JOHNSON, Pharr; from Camp Travis, Capt. BERNARD F. SMITH, San Antonio.

To Camp Jackson, Columbia, S. C., base hospital, from San Antonio, Lieut. EDWARD B. JONES, Jacksonville.

To Camp Kearny, Linda Vista, Calif., base hospital, from Camp Logan, Capt. EUGENE R. CARPENTER, El Paso.

[illegible] Texas, base hospital, Lieut. SCOTT C. [illegible]

[illegible] Junction, Md., for duty, from Camp Cody, Lieut. ERNEST H. HAMILTON, Kilgore.

To Camp Travis, Fort Sam [illegible] Lieuts. THOMAS C. BREWER, Dall[illegible] Houston. With the board examining the troops for cardiovascular diseases, Lieut. DAVID W. CARTER, JR., Georgetown.

To Camp Wheeler, Macon, Ga., base hospital, from Camp Crane, Capt. GEORGE C. BRUNNELLE, El Paso.

To Fort Leavenworth, Kan., for duty, Capt. WILBUR F. THOMSON, Beaumont; Lieut. GEORGE C. KINDLEY, Dallas.

To Fort Oglethorpe for duty, from Fort McPherson, Lieut. CLARENCE R. MILLER, San [illegible] REDERICK O. WAAGE, El Paso; [illegible] YD SWONGER, Beaumont; JAMES [illegible] P. GIBBS, Houston; Lieuts. OSCA[illegible] MACUNE, Hillsboro; SIMM H. M[illegible] EDWARD C. MURRAY, *Houston*; JOHN W. BLAKE, Rosenberg; WILLIAM S. HANSON, WILLIAM B. URMSTON, San Antonio.

To Fort Riley, base hospital, Lieut. ROGER A. THARP, Austin.

To Fort Sam Houston, Texas, base hospital, from Camp Bowie, Major JAMES G. FLYNN, Fort Crockett; from Camp Beauregard, Lieut. COLEMAN J. CARTER, Oakwoods.

To Montgom[illegible]ation School, for duty, from Mineola, Capt. [illegible] Dallas.

To New Yor[illegible] for instruction, and on completion *to Cam*[illegible]n, Md., base hospital, Major HERSCHEL F. CONNELLY, Waco.

Utah

To Boston, Mass., Harvard Graduate School of Medicine, for instruction, *from Fort Riley, Lieut.* CHARLES E. BRAIN, *Salt Lake City.*

To Fort Logan, Colo., for duty, from Fort H. G. Wright, Lieut. GEORGE W. CLARKE, Springville.

Vermont

To Camp Kearny, Linda Vista, Calif., with the board examining the command for nervous and mental diseases, from San Francisco, Capt. SIDNEY M. BUNKER, Burlington.

To Camp [illegible] duty, from Fort Oglethorpe, Lieut. JAMES L. [illegible] Depot. *To Fort McPherson, Ga.*, for duty, Li[illegible]LOR, Burlington.

To Fort Oglethorpe for instruction, Lieut. DAVID R. BROWN, Lindowville.

To Indianapolis, Ind., to give medical attention to the drafted men, from Fort Oglethorpe, Capt. *NICHOLAS DELEHANTY, Rutland.*

Virginia

[illegible] S. C., *for duty, from Camp Zachary* [illegible]ST, Portsmouth.

To Fort Oglethorpe for instruction, Capt. HARRY WALL, Claremont; Lieut. WILLIAM I. LAUGHON, Richmond.

To Hoboken, N. J., for temporary duty, from Camp Meade, Lieut. ROBERT S. PRESTON, Richmond.

To Washington, D. C., for temporary duty in the Surgeon-General's Office, from Fort Oglethorpe, Capt. LEWIS M. ALLEN, Gaylord.

Washington

To Alcatraz, Calif., for duty, from Camp Fremont, Capt. FRANK H. COLLINS, Goldendale.

To Camp Lewis, American Lake, Wash., as a member of the board *examining the command for tuberculosis*, Lieut. CHARLES D. HUNTER, Tacoma.

To Fort Sam Houston, Texas, for duty, from Camp Sheridan, Lieut. WALTER A. BURG, Uniontown.

To Hoboken, N. J., base hospital, from Fort Lawton, Major CHARLES A. BETTS, Fort Lawton.

To Rock Island, Ill., for duty, from Fort Riley, Lieut. LEGRAND SPAULDING, Kennewick.

To San Francisco, Calif., for instruction, and on completion *to his proper station*, from Camp Lewis, Capt. HENRY H. SLATER, Deer Park.

West Virginia

To Boston, Mass., Harvard Graduate School of Medicine, for instruction, from Camp Pike, Capt. EMERSON MEGRALL, Wheeling.

To Camp Greene, Charlotte, N. C., base hospital, Lieut. CHARLES F. MAHOOD, Alderson; ROBERT J. WILKINSON, Huntington.

To Camp Lee, Petersburg, Va., base hospital, Lieut. ROBERT J. WILKINSON, Huntington. With the board examining the troops for tuberculosis, from Camp Sevier, Lieut. FERDINAND W. WIEHE, Wheeling.

To Camp Wadsworth, Spartanburg, S. C., for duty, from Fort Oglethorpe, Capt. WILLIAM C. COVEY, Pemberton.

[illegible] for instruction, Lieuts. ETLEY P. SMITH, [illegible] S. FLEMING, CLAUDE M. VAUGHAN, [illegible]SKINS, Lillybrook; LUSIUS LAMAR, Minne[illegible]ny Medical School, Lieut. JOHN E. MILLER, Widen.

To Fort Porter, N. Y., for duty, Capt. CHARLES A. BARLOW, Beverley.

Wisconsin

To Camp Dix, Wrightstown, N. J., for duty, Lieut. JUSTUS SUTHERLAND, Brodhead.

[illegible] Ill., for duty, from Camp Logan, Capt. [illegible]aukee.

[illegible]ia, S. C., for duty, Lieut. HENRY H. [illegible], Madison, from Camp Dodge, Lieut. THOMAS C. CLARKE, Oconto.

[illegible] Annapolis Junction, Md., for duty, from Camp [illegible] WILLIAM N. MOORE, Appleton.

[illegible]tle Rock, Ark., for duty, from Fort Riley, Capt. [illegible]D, Janesville.

[illegible] for instruction, Lieuts. LEO. A. HOFFMAN, [illegible]H B. QUINN, Darlington; LAUREL E. YOUMAN, Mukwonago; CHARLES C. DAVIN, New Richmond; DE WAYNE TOWNSEND, Oconomowoc; from Fort Myer, Lieut. CLARENCE N. SONNENBURG, Sheboygan.

To Lakewood, N. J., for temporary duty, Lieut. EUGENE A. GATTERDAM, La Crosse.

To report to the comanding general, Philippine Department, for duty, from Camp Cody, Capt. GEORGE A. BADING, Milwaukee.

To Rochester, Minn., Mayo Clinic, for instruction, and on completion *to Camp Sheridan*, Montgomery, Ala., base hospital, Lieut. GEORGE M. SMITH, Chippewa Falls. On completion *to Camp Zachary Taylor*, Louisville, Ky., base hospital, Lieut. ANTHONY H. LOOZE, Brodhead.

To Rockefeller Institute for instruction in the treatment of infected wounds, and on completion *to Camp Sevier*, Greenville, S. C., base hospital, Capt. THOMAS F. SHINNICK, Beloit.

Wyoming

To Camp Fremont, Palo Alto, Calif., as orthopedic surgeon, from Chicago, Lieut. ROBERT H. SANDERS, Kemmerer.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest; such as relate to society activities, new hospitals, education, public health, etc.)

ILLINOIS

Service Flag Unfurled.—At the meeting of the Vermilion County Medical Society, at Danville, June 4, a service flag bearing seventeen stars was dedicated. The principal address was delivered by Dr. Elmer B. Cooley, Danville, formerly president of the Illinois State Medical Society.

Continuous Term for Medical School.—The University of Illinois College of Medicine, announces that, beginning June 3, it will be operated on the quadrimester system of three terms of four months each per calendar year. The courses will be so arranged that the students may enter the school at the beginning of any of the three terms.

Women's Club Election.—At the annual meeting of the Medical Women's Club, June 19, the following officers were elected: president, Dr. May Cushman Rice; vice presidents, Drs. Katherine B. Rich and Clara Jacobson; secretary, Dr. Grace H. Campbell; treasurer, Dr. Ione F. Beem, and editor of the *Bulletin*, Dr. Sadie Bay Adair, all of Chicago.

Chicago

Annual Meeting of Physicians' Club.—At the annual meeting of the Physicians' Club of Chicago the following officers were elected: chairman, A. A. O'Neill; secretary, V. D. Lespinasse; treasurer, H. W. Cheney; directors, E. J. Doering, D. N. Eisendrath, O. W. McMichael and A. M. Corwin. The closing function of the year was a banquet in honor of Major-General Gorgas, at which representatives of the various departments of the Army were speakers.

Extending Infant Welfare Work.—Four new infant welfare stations will be established in Chicago as the result of the money-raising campaign during the recent baby week, when $67,000 was raised, $2,000 more than the goal set. Heretofore, only children under 2 years have been cared for at the stations, but it is hoped that the resources will soon allow an extension of the work to include children under 6 years. There are now twenty-two infant welfare stations. The increase will make the number twenty-six.

INDIANA

Ground Broken for Medical School.—The first ground was broken for the new $238,000 building of the Indiana University School of Medicine, on the ground of the Robert W. Long Hospital, Indianapolis, June 17, by Governor Goodrich, who also made the principal address.

Personal.—Dr. Marcus Ravdin, Evansville, has presented Indiana University with a gold medal to be given annually to the student of the medical department who attains the greatest proficiency during his four years' course.—Dr. Herman G. Morgan, secretary of the Indianapolis Board of Health, has been appointed superintendent of the city hospital, succeeding Dr. Thomas L. Sullivan, who has entered military service.

MAINE

Personal.—Dr. Leverett D. Bristol, Augusta, commissioner of the state department of health, has been designated as chairman of the state committee of the American Society for the Control of Cancer.

New State Officers.—At the annual meeting of the Maine Medical Association held in Portland, June 4 to 6, the following officers were elected: president, Dr. George H. Coombs, Waldoboro; vice presidents, Drs. John Sturgis, Auburn, and Charles W. Bell, Strong; secretary-treasurer, Dr. Bertram L. Bryant, Bangor, and councilor delegates, Drs. John F. Thompson, Portland; Ernest V. Call, Lewiston; Byron F. Barker, Bath; Oliver W. Turner, Augusta; Walter N. Miner, Calais, and Charles H. Burgess, Bangor.

MARYLAND

Fifth Case of Infantile Paralysis.—The health department announced recently that a suspect under observation for the past week had developed a genuine case of infantile paralysis. The patient is a Polish infant, 2 years old, living near t waterfront in southeast Baltimore. The child has paralys of the right shoulder and weakness in the right leg. It is mild attack and the fifth case of the disease to be reported i the city this year.

Flag Raising at U. S. Army General Hospital No. 7.— flag donated by the workmen engaged in the construction o the new buildings at the U. S. Army General Hospital No. 7 Evergreen, Baltimore, which is for the treatment and training of soldiers blinded in service, was raised during the past week on the observation tower commanding a view of the grounds. Capt. Francis E. Chuney, a member of the hospital staff, supervised the arrangements.

Personal.—Dr. C. Frank Jones, health warden of the fifteenth ward is convalescent after an operation performed at St. Joseph's Hospital a short time ago.——Mrs. Agnes C. Hartridge, formerly superintendent of nurses at University Hospital, Augusta, Ga., has been placed in charge of the admitting office at Johns Hopkins Hospital, succeeding Dr. William C. Leavenworth, who has been given supervision of the hospital dispensary. Dr. Leavenworth in his turn succeeded Dr. L. Palmer Holmes, New York City, who has entered military service.——Dr. Cornelius De Weese, Laurel, was acquitted, June 6, of criminal blame in connection with the death of Ambler McManus, Marlboro, who died as the result of injuries sustained when he was struck by an automobile driven by Dr. De Weese.——Dr. Edward P. Smith, for five years general superintendent of the Mercy Hospital, has resigned and will engage in practice in Baltimore.——The health department has appointed Dr. William Dew assistant supervisor of pasteurization in place of Dr. Claude van Bibber, resigned.——Dr. George A. Fleming, Baltimore, was exonerated by the coroner from all blame in the death of James B. Loane, who was struck by an automobile driven by Dr. Fleming and so severely injured that he died before reaching the Franklin Square Hospital.

MICHIGAN

New Society Officers.—At the annual meeting of the Wayne County Medical Society, held in Detroit, Dr. John L. Bell was elected president; Dr. Walter J. Wilson, Jr., vice president, and Dr. Raymond C. Andries, secretary.

Damages for Typhoid.—Damages amounting to $50,462 were granted to members of the Detroit Commandery, No. 1, K. T., and members of their families, on account of sickness caused by drinking polluted water from the Sault Ste. Marie River during a cruise on the steamship South American, in June, 1915.

Tuberculosis Farm for Detroit.—Dr. James W. Inches, health officer of Detroit, proposes to purchase a large tract of land suitable for farming and the erection of a large infirmary and a number of cottages for the treatment of cases of incipient tuberculosis. The proposed institution will cost about $1,000,000.

Personal.—Dr. Vinton J. Rickerd, Charlotte, is reported to be seriously ill with septicemia due to an infected wound of the finger.——Dr. Wayne J. Atwell, instructor in anatomy in the University of Michigan, Ann Arbor, has been appointed professor of anatomy in the University of Buffalo.——Dr. M. N. Nielson, Calumet, has been appointed oculist for the Middle Range Railroad.

To Study Sanatoriums.—Drs. Francis Duffield, Detroit; James W. Inches, St. Clair, and Albert M. Wehenkel of the Detroit Board of Health, and William B. Stratton have gone to Boston to attend the meeting of the National Tuberculosis Association and also to study sanatorium plans and investigate methods of handling the tuberculosis problem. For this work the Detroit City Council has made an appropriation of $2,000.

College Half a Century Old.—The Detroit College of Medicine and Surgery has completed fifty years of work and in celebration thereof, clinics were held, June 5 and 6, at the various hospitals in Detroit. Dr. John B. Deaver, Philadelphia, gave a surgical clinic at Harper Hospital, and Dr. Bertram W. Sippy, Chicago, a clinic on "Peptic Ulcer." On the evening of June 6, the annual smoker and vaudeville entertainment of the college was held.

MINNESOTA

War Chest for Hennepin County.—At a meeting of the Hennepin County Medical Society, May 27, seventy-five members of the society voted to contribute to a fund of at least $35,000 a year, to be devoted to the uses of dependents of members of the society who have entered military service. Sixty members are at present in war service.

Personal.—Dr. Benjamin F. Simon has been appointed health commissioner of St. Paul, succeeding Dr. Justus O'Hage.——Dr. G. M. Palmer, Bemidji, left for France, June 13, where he will do field work for the national Y. M. C. A.——Dr. Andrew W. Hilger, St. Paul, was operated on, June 3, in St. Joseph's Hospital and is reported to be doing well.——Dr. Charles H. Hunter, Minneapolis, is ill with nephritis at the Eitel Hospital, Minneapolis.——Dr. Pearl M. Hall, Minneapolis, has succeeded Dr. George W. Beach as superintendent of the Walker State Tuberculosis Sanatorium.——Dr. Albert J. Chesley, Minneapolis, has gone to France to assist in epidemiological work under the auspices of the American Red Cross.——Mr. Wallace G. Nye has been appointed permanent manager of the Minneapolis City Hospital.

MISSOURI

Personal.—Dr. Buford M. Colby, assistant physician at State Hospital No. 2, St. Joseph, has accepted the position of superintendent of the General Hospital at Kansas City.——Dr. Paul E. Coil of Mexico has purchased a residence in that city, which will be remodeled and adapted to hospital uses. The plans call for accommodations for fourteen patients with modern equipment throughout. The hospital will be opened about July 15.

NEW YORK

State Health Officers Meet.—The annual conference of state health officers met in Saratoga, June 25, 26 and 27. Among the speakers were Surg.-Gen. William C. Gorgas, Miss Julia Lathrop, chief of the federal Children's Bureau; Col. Simon Flexner, Dr. Rufus I. Cole, Major Alexander Lambert, Dr. John A. Fordyce, Dr. Livingston Ferrand and Dr. S. Josephine Baker.

Personal.—Dr. Stephen A. Brown, Westfield, who was shot in the jaw by Joseph J. Johnson, was discharged recovered from the Brooks Memorial Hospital, June 12.——Dr. Ledra Heazlit, Auburn, was caught between his automobile and a doorway of his garage, June 9, fracturing his right hip.——Dr. Roy H. Wixson has been appointed president; Dr. Harry C. Dumville, vice president, and Dr. George D. Stilson, secretary, of the Niagara Falls Academy of Medicine.

New York City

Conditions of Doctorate Degree.—Columbia University announces that after September of this year the degree of doctor of medicine will be conferred by the Columbia University College of Physicians and Surgeons only on men who have had one full year of service in a hospital under faculty supervision, in addition to four years in a medical school.

Personal.—Dr. Walter B. James, president of the New York Academy of Medicine, has been elected a trustee of Columbia University for a term of six years.——Dr. William H. Pierson, Brooklyn, has been elected president of the medical board of the Cumberland State Hospital.——Dr. Benjamin T. Terry, Brooklyn, has been appointed professor of pathology in Vanderbilt University, Nashville, Tenn., succeeding Dr. James W. Joblin, who has accepted an appointment at Columbia University.

Red Cross Money for Medical Research.—The war council of the American Red Cross announces that it has received a request from Cleveland H. Dodge, who subscribed $1,000,000 and various smaller amounts during the second Red Cross drive, that $250,000 of this sum be set aside for medical research work. In his letter to the American Red Cross, Mr. Dodge expresses himself as much impressed by the work done in ascertaining the methods of transmission of trench fever, and he directs that the foregoing sum be applied to a "thorough-going conduct of medical research designed to ascertain methods for the prevention and cure of diseases to which our soldiers and sailors may be exposed."

President Wilson Petitioned to Aid Hospitals.—A special meeting of the hospital conference of the city of New York met at the New York Hospital, June 17, to discuss ways and means of meeting the shortage of help of all kinds in the hospitals of this city and of the nation as a whole. Dr. Sigismund S. Goldwater brought out the fact that if the suggestion of a one-year intern course were adopted, on a basis of one intern to every twenty-five patients, there would be immediate need for 10,000 interns. Resolutions were adopted asking President Wilson to halt the further disruption of hospital organizations. A set of resolutions embodying a scheme to protect the hospitals and their personnel was drafted for presentation to Congress.

OHIO

New Venereal Disease Regulations.—New regulations regarding the control of venereal diseases in the state have been filed with the state department of health and will become effective, July 1. They require every case to be reported to the state board within twenty-four hours of diagnosis by physicians and dentists, with the name of the patient and various details, including the source of the infection, if possible. The patient is to be quarantined whenever the state commissioner of health considers quarantine necessary. Medical examination may be required of all persons "reasonably suspected of having venereal disease." This includes all prostitutes and persons associating with them. Cooperation of local health officials in the repression of prostitution is to be secured to the greatest possible extent.

PENNSYLVANIA

Personal.—While driving an automobile ambulance containing two convalescent soldiers into Philadelphia, Dr. Clifford B. Lull, West Scranton, attached to the Jefferson Ambulance Unit, rescued two women from an overturned and burning automobile.

Philadelphia

Class Banquet.—The fortieth anniversary banquet of the class of 1878, Medical Department of the University of Pennsylvania, was recently held at the University Club. Out of a graduating class of 128, there are 61 living.

Visit of British Medical Men.—The British medical deputation, touring this country to assist in the development of the Medical Reserve Corps, and consisting of Sir James Mackenzie, Sir William Arbuthnot Lane and Col. Herbert Bruce, were the guests of honor of the local medical societies at a reception in the ballroom of the Bellevue-Stratford Hotel, June 24.

Personal.—Dr. Elmer H. Funk has been appointed medical director of Jefferson Hospital Unit No. 28, which will soon leave for France.——Dr. Joseph Leidy has offered to be one of the 100 citizens to give $1,000 each to establish an endowment for the maintenance of military training in the high schools of the city.——Dr. Joseph S. Neff, Narberth, formerly director of health and charities, has been named by Governor Brumbaugh a member of the advisory board of the state department of health to succeed the late Senator Daniel Gerberich of Lebanon.

RHODE ISLAND

Personal.—Dr. A. J. Giggers, Providence, bacteriologist of the Rhode Island State Department of Health, has been appointed city bacteriologist of Rochester, N. Y.

State Society Meeting.—At the annual meeting of the Rhode Island Medical Society held in Providence, June 4 to 6, under the presidency of Dr. John Champlin, Westerly, the following officers were elected: president, Dr. Gardner T. Swarts, Providence; vice presidents, Drs. John M. Peters and Jesse E. Mowry; secretary, Dr. James W. Leech, Providence (reelected), and treasurer, Dr. Winthrop A. Risk.

UTAH

Appropriation for Social Disease Dispensary.—The city commission of Salt Lake City has voted an appropriation of $5,400 to defray the cost of the municipal dispensary to be established by the health department for the treatment of venereal diseases.

Personal.—Dr. Frank M. McHugh, Salt Lake City, suffered a severe scalp wound, and Dr. W. P. Skindale suffered contusions in a collision between a street car and an automobile in which they were riding, May 10.——Dr. Ephraim G. Hughes, Provo, has been appointed surgeon and consultant to the State Mental Hospital.

WASHINGTON

New County Officers.—At the annual meeting of the Lincoln County Medical Association, held in Harrington, June 2, Dr. Lee Ganson, Odessa, was elected president; Dr. Rufus

P. Moore, Davenport, vice president, and Dr. Joseph E. Bittner, Sprague, secretary-treasurer.

Medical Women Elect Officers.—At the annual meeting of the Medical Women's Club of Seattle, June 3, the following officers were elected: president, Dr. Sarah A. Kendall; vice president, Dr. Ada Collison; secretary, Dr. Mary D. Skinner, and treasurer, Dr. Mariette M. Armstrong.

Personal.—Dr. John R. Neely, Spokane, has been elected first assistant health officer, and Dr. David H. Ransom, Clarkston, second assistant city health officer of Spokane.——Dr. John W. Mowell, Olympia, chief medical adviser for the state of Washington, is ill with pneumonia at the base hospital at Camp Lewis.

WISCONSIN

Sanatorium Notes.—A fresh air camp for children suffering from tuberculosis has been opened near Neenah, with fifteen children in attendance.——The Jefferson County Board of Supervisors has appropriated $50,000 for a county tuberculosis sanatorium.

Personal.—Dr. William P. Barrett, Milwaukee, who was seriously injured in an automobile accident on the Cedarburg Road, June 9, is improving under treatment at the Emergency Hospital.——Dr. Gustave Windesheim has been reelected president, and Dr. George H. Ripley, vice chairman of the Kenosha Board of Health.

CANADA

Entire Class Volunteers.—At the convocation of the Western University, London, Ont., the entire graduating class in medicine appeared in uniform, as every member had volunteered to enter the Canadian Army Medical Corps for service at the front.

Medical Council Election.—At the concluding session of the medical council of Canada, held in Ottawa, June 12, it was decided that the next annual meeting should be held in Ottawa, on the third Tuesday in June, 1919. The following officers were elected: honorary president, Sir Thomas J. Roddick, Montreal (reelected); president, Dr. R. Eden Walker, New Westminster, B. C.; vice president, Dr. James C. Connell, Kingston, Ont.; registrar, Dr. Robert H. W. Powell, Ottawa, Ont. (reelected); general council, T. H. Chrysler, K. C., Ottawa, Ont.; auditor, G. L. Blatch, T. C. A., Ottawa, Ont.; executive committee, the honorary president, president and vice president, and Drs. Emmanuel P. Lachapelle, Montreal; Hon. Robert S. Thornton, Winnepeg, Manit.; Walter W. White, St. John's, N. B.; Hon. Reginald H. Brett, Edmonton, Alta., and Alexander MacNeill, Summerside, P. E. I.

Personal.—Dr. Charles J. C. O. Hastings, medical health officer of Toronto, delivered an address before the Alumni Association of the University of Buffalo, June 8, on "Influence of the War on Public Health Problems."——Lieut.-Col. William G. Anglin, Kingston, has been appointed registrar of man power in Kingston.——Dr. James D. Curtis, for two years medical officer for the workman's compensation board, Toronto, has returned to St. Catherine and has resumed practice.——Dr. Thomas E. Case, Dungannon, Ont., has been elected a member of the Ontario legislature by acclamation. ——Lieut.-Col. Thomas M. Leask, C. A. M. C., Moose Jaw, Sask., has received the D. S. O.——Col. Herbert A. Bruce and Sir Arbuthnot Lane were given a dinner at the York Club, Toronto, the evening of Monday, June 17. Afterward, they addressed the members of the Toronto Academy of Medicine on war problems, especially on their mission to the United States. Sir James Mackenzie was unable to be present.——Lieut.-Col. Henry R. Casgrain, Windsor, Ont., is still in command of No. 8 Canadian Hospital at St. Cloud, France.——Dr. Helen MacMurchy, Toronto, has been elected president of the Women's Canadian Club, Toronto.——Col. Alexander Primrose, Toronto, is mentioned as professor of surgery in the University of Toronto, in case there should be a reorganization of the medical staff.——Lieut.-Col. George G. Nasmith, C. M. G., of the department of health, Toronto, has been presented with a diploma in public health by the University of Toronto.——Surg.-Gen. George A. Sterling Ryerson, Toronto, on his western trip to the Pacific Coast, was detained several weeks in Seattle by the serious illness of his wife. ——Sir James A. Grant, Ottawa, is the only living member of the medical council of Ontario of 1866. He has been present at almost every meeting of the council in the last fifty-one years. He is also the only living member of the first Canadian Parliament at Confederation in 1867.——Dr. Alvin M. Warner, Vancouver, B. C., has been mentioned in dispatches from East Africa. Captain Warner gave up his practice early in 1916 to join the R. A. M. C. He was given command of the Blue Carrier Hospital and has built it up to an institution of 1,200 beds.

GENERAL

Surgeon-General Receives Degree.—Surg.-Gen. William C. Braisted, U. S. Navy, while in Chicago attending the meeting of the American Medical Association, had conferred on him the degree of Doctor of Science, by the Northwestern University, Evanston, Ill.

New Medico-Psychologic Officers.—At the annual meeting of the American Medico-Psychological Association in Chicago, June 5 to 7, under the presidency of James V. Anglin, St. Johns, N. B., the following officers were elected: president, Dr. Elmer E. Southard, Boston; vice president, Dr. Henry C. Eyman, Massillon, Ohio; secretary-treasurer, Dr. Arthur P. Herring, Baltimore, and auditor, Dr. Joseph C. Clark, Sykesville, Md.

Bequests and Donations.—The following bequests and donations have recently been announced:

Michael Reese Hospital, Chicago, $20,000, by the will of Joseph Schaffner.

Methodist Hospital and Deaconess Home, Indianapolis, $50,000, by the will of Charles W. Fairbanks, Indianapolis.

Medical Department, University of Pennsylvania, $50,000 for the founding of a chair of gynecology, by the will of Dr. William C. Goodell.

Middlebury (Conn.) College, $50,000 for the building of a hospital, a donation by Mr. William H. Porter, New York City.

Climatologists Elect Officers.—The American Climatological and Clinical Association, at its thirty-fifth annual convention held in Boston, June 5 to 6, elected the following officers: Dr. Guy Hinsdale, Hot Springs, Va., president; Drs. Joseph H. Pratt, Boston, and Hugh M. Kinghorn, Saranac Lake, N. Y., vice presidents; Dr. Arthur K. Stone, Boston, secretary-treasurer, and Dr. William D. Robinson, Philadelphia, recording secretary.

Surgeons Elect Officers.—At the annual meeting of the American Surgical Association, held in Cincinnati, June 6 to 8, under the presidency of Dr. Thomas W. Huntington, San Francisco, the following officers were elected: president, Dr. Lewis S. Pilcher, Brooklyn; vice presidents, Drs. George W. Crile and Edward Martin, Philadelphia; secretary, Dr. John H. Gibbon, Philadelphia; assistant secretary, Dr. Francis T. Stewart, Philadelphia; treasurer, Dr. Charles H. Peck, and assistant treasurer, Dr. Charles N. Dowd, New York City.

Federal Aid and Extension of Rural Sanitation.—At the sixteenth annual conference of state and territorial health authorities with the United States Public Health Service, Washington, D. C., June 3 and 4, resolutions were adopted reciting the need of rural sanitation and endorsing federal aid extension. The U. S. Public Health Service was urged to persist in securing legislation to this end, with the assistance of state health organizations. A federal system of supervision of the health of war industrial centers was advocated. Arkansas was commended for its compulsory vaccination law. The Chamberlain-Kahn bill for the suppression of venereal diseases among the civilian population, as well as in the military forces, was endorsed. A committee was recommended to study and report on sewage disposal in unsewered communities, and the authorities were called on to ascertain and make a statement of the number of members of the medical profession, sanitary engineers and graduate nurses taken from public health work by military needs, and the number that will probably be taken from such work. A committee of five was selected to confer with the committee on sanitary policy under war conditions.

FOREIGN

Prize for Research on Arsphenamin (Salvarsan).—The Academia de Ciencias Medicas of Bilbao, in northern Spain, offers two prizes of 250 pesetas each for the best work on arsphenamin and its derivatives, their production and chemical differentiation, and pharmacologic research on them and on methods of making them in Spain. Competition is open only to Spanish physicians, pharmacists, veterinarians and dentists, and the works must be in the hands of the secretary before Aug. 1, 1918. Address, Secretario general, C. Mendaza, Bilbao.

Netherlands Hospital Unit in France.—On the occasion of his leaving for return to the Netherlands, Dr. L. van den Steen, who has been at the head of the Netherlands ambulance at Pré Catalan, Paris, was presented with a bronze medal by the Netherlands colony in Paris, with much ceremony. The French government also presented him with the Cross of the Legion of Honor in recognition of his devoted services for such a long time. The *palmes académiques* were also conferred on his wife. His place as chief of the ambulance has been taken by Dr. A. E. Vermey, who has been at the hospital since the first of the year.

Honors Asked for Medical Men in Austria.—The *Nederlandsch Tijdschrift* relates that in the lower house of the Austrian parliament an appeal recently was made to the authorities to arrange for more appropriate recognition of the difficult and dangerous work accomplished by the members of the medical corps of the army. Some of the deputies emphasized that many hundreds have died or been weakened by infectious diseases or have been held war prisoners for years. No provisions, however, have been made for decorating them for conspicuous gallantry beyond the same distinctions granted to nurses, officers' wives and court lackeys. The deputies demanded that the medical officers should be placed on the same plane in this respect as other military officers.

Medical Care for Refugees in France.—The *Progrès Médical* gives the text of a recent official notice which provides that army physicians and surgeons and the mobilized civilian medical men are to care for refugees in their respective districts when called on to do so by the prefect of the place when the local civilian force of physicians is inadequate to attend them. No fees are to be asked or accepted. Parties of refugees in barracks, improvised hospitals, etc., come under the provisions of this notice. The chief of the regional army medical department is to furnish the medical personnel at the request of the prefect. The medicines and dressings used are to be supplied by the usual provisions for care of the indigent. If they are provided by the army medical department, the latter will be reimbursed by the state department of the interior.

Death of Pozzi.—The cable brings the tragic news that Professor Pozzi of Paris, aged 72, was recently shot by a man—probably demented. Prof. Jean Samuel Pozzi was well known in this country, as he was a prominent figure at international medical gatherings, and what he had to say on gynecology and abdominal surgery was authoritative. He had been president of the Société de Chirurgie, d'Anthropologie and de Gynécologie, and presided at many medical congresses besides taking a prominent part in national legislation as senator, as member of the conseil de surveillance of the Assistance publique. He founded the *Revue de Gynécologie et de Chirurgie abdominale* in 1897, and his Traité de Gynécologie has been translated into five languages at least. Besides a love of travel, he was interested in archeology, and was vice president of the French society for archeologic research.

Deaths in the Profession Abroad.—**G. J. G. Minderop**, a prominent physician of Rotterdam, aged 84.—**B. Sommer**, professor of dermatology at the University of Buenos Aires; delegate from Argentina in various international medical and specialist gatherings; secretary of the international conference on leprosy at Berlin in 1897, and for a time chief of the Asistencia Publica of Buenos Aires and member of the city council.——**P. Gomez** of Bogota, Colombia, who helped to lay the foundation for the prophylaxis and treatment of epidemic diseases in Colombia, aged 74.——**J. G. del Castillo**, medical inspector of the Argentine navy into which he introduced vaccination against typhoid and obligatory prophylaxis against venereal disease.——**R. Frias**, professor of surgery at the University of Lisbon, aged 65.——**Perrin de la Touche**, professor of physiology at the medical school at Rennes and lately director of the school, also a son, grandson and great grandson of physicians.——The *Nederlandsch Tijdschrift* mentions the death of the surgeon, **F. Riedinger**, at Würzburg, aged 73; of the pediatrist **Ganghofner** of Prague, aged 75; of the neurologist **Lewandowsky** of Berlin, who succumbed to typhus, and of the ophthalmologist, **S. Bernheimer** of Innsbruck.

CORRECTION

Body of Colonel Reno Not Recovered.—Some time ago The Journal printed a statement to the effect that the body of Col. W. W. Reno, reported lost at sea, had been recovered. The statement was taken from a newspaper item. We find on investigation that the newspaper item was in error, and that, although thorough search has been made, the body of Colonel Reno has not been found.

LONDON LETTER

London, May 28, 1918.

The Bombing of British Hospitals

German "thoroughness" has left no possible atrocity undone in this war, and attacks on the Red Cross by sea and land have become a commonplace. But for sheer fiendishness the recent bombing of a large group of hospitals in France may be regarded as the climax. The hospital tents cover a great area of ground, and the Germans are perfectly well aware of the character of the place; the entire absence of concealment makes it a mark which no airman could possibly miss. Bombs dropped from any height in any wind must land somewhere among the attendants' quarters or the tents occupied by the wounded. On a Sunday night two separate squadrons, numbering together more than a score of machines, dropped bombs which caused many casualties to patients, sisters and medical officers far exceeding those of a London raid. Taught by experience that the Red Cross is no protection against German barbarity, the authorities had provided shelters to which the sisters could have gone for refuge; but as the cots were filled with helpless wounded, many hundreds of whom could not be moved, they refused to leave their patients and did their best to keep up their courage. Many paid for their devotion with their lives. Some of the German machines came down low, and the raiders raked the hospital tents and attendants' quarters with their machine guns. The captain of one machine, formerly employed in the German diplomatic service, was brought down wounded. He tried at first to excuse himself by saying he saw no Red Cross. Challenged with the fact that he knew he was attacking hospitals he endeavored to plead that they should not be placed near railways and if they were they must take the consequences. But apart from the fact that hospitals must be near railways for the transport of patients, the raiders in this case did not attack the railway but deliberately bombed the hospital.

Physicians for the Army

New regulations have been made relating to applications for the exemption of physicians from army service. A special medical tribunal is to be appointed which can refer applications to local professional committees to report on them. As in the past, applications concerning members of the staffs of London hospitals will be referred to a special committee of reference. When the circumstances of each locality are under review, notification will be sent by the Minister of National Service to each physician affected, informing him of the time in which he may apply for exemption from military service. There is a special provision under which an exemption shall be subject to the condition that the physician shall undertake such professional service as the government may deem best in the national interests. This provision has been made because the demand for physicians for military and civil service is so great that only by a careful distribution of the available physicians can the requirements of the country be met.

An Index of Military Medical Officers

A card index of all medical officers whether regular, retired, special reserve, territorial, or holding temporary commissions, has been in existence for some time and is now being extended and completed. It has been found of great utility. Medical officers are asked to furnish particulars as to age, medical school, qualifications, hospital and other appointments, such as that of health officers, and to give information as to any special training, research work or publications. They also have to furnish information as to how they have been employed during the war. These particulars are transferred to index cards which are kept at the director general's office. When an officer is posted to an expeditionary force or command a duplicate is forwarded to the headquarters of the force where it may be added to, or form the basis of, what may be called a local card index. The blanks filled in by the medical officers after being used for the purpose of the card index will be passed on after classification to a series of specialist committees, who will grade the officers according to the extent and nature of their experience. Thus, for example, an officer who has undertaken or directed independent researches will be put in Grade 1, from which selection will be made for higher appointments, such as director of the military laboratory. An officer with less experience, who has shown himself capable of research under supervision, will be placed in Grade 2 and eligible for similar employment in military laboratories. Officers trained in bacteriology, but who have not yet done research work, will be placed in Grade 3 and employed as assistants in military laboratories. The same principle will apply to other specialties.

A Hospital Alleged to Be a "Nuisance"

An unusual case has been heard in the High Court of Justice in which the proprietors of a house in Newport brought an action to restrain the defendants from using it as a hospital for surgical tuberculosis, on the grounds that this would be a "nuisance." One of the covenants in the lease was that no noisy, noisome or offensive trade or business was to be carried on. The plaintiffs alleged that tuberculosis is an infectious disease and the hospital a source of danger to the neighborhood. For the defendants a large mass of expert evidence was given that the hospital would not be a source of danger to the neighborhood and that there was no risk of infection to those in its immediate vicinity. The judge, Mr. Justice Eve, therefore decided that the hospital was not a nuisance. He found as to the sights that it was not proved that "every detail of the dressing of the patients was visible to inhabitants of neighboring houses." As to noise, it had been exaggerated, and, like the sights, could not reasonably be said to amount to anything that was noisome or offensive, though he could well understand that it might now and again be distressing and even annoying. As to smells, the case on the disinfectants, in his opinion, came to nothing, and as the alleged smell from the burning of dressings and bandages was not mentioned until the trial, when the defendants had no opportunity of investigating the matter, he should not allow that to be substituted for the complaint in the pleading. The hospital was in no sense a danger to the neighborhood and there was nothing in the way in which it was conducted that could properly be said to be noisome or offensive.

Precautions Against the Spread of Malaria in England

In a previous letter to The Journal some cases were related in which soldiers suffering from malaria had, through the medium of mosquitoes, been a source of infection. This danger from the return of infected soldiers from abroad has been apprehended by the War Office for some time. Early in 1917 it was decided to concentrate infected soldiers in eight special malaria hospitals under the control of medical officers experienced in the disease. Col. Sir Ronald Ross has now issued a memorandum on the subject. Indigenous cases of malaria began to appear in England last summer. The first series consisted of five or six cases of benign tertian in the Aldershot district among the troops. Then some civil and military cases were reported in other districts. Civilian health officers were communicated with and worked in conjunction with the military authorities. General instructions for the treatment of malaria patients, both in hospital and outside, were issued broadcast by the War Office. According to these, all malaria patients were given 60 grains of quinin weekly, and were provided with additional bottles of quinin tablets in order to prevent relapses of fever and the spread of the disease from malaria carriers to healthy persons. Simultaneously, all malaria patients in places where mosquitoes abounded were collected in sheds protected against the entry of the insects, when they were not sent to special malaria hospitals. The patients in the malaria hospitals were similarly protected when necessary. Much work was done in the way of clearing and oiling pools and watercourses. For military reasons it was not found possible altogether to keep old cases of malaria out of all districts where anophelines abound, but it is thought that protection from mosquitoe bites with persistent dosing with quinin will suffice to check the spread of malaria from the military cases in such localities. In Sir Ronald Ross' opinion the anophelines are comparatively so scarce in most parts of Britain as to render the danger of spread of malaria a negligible quantity, except only at a few spots where the insects are more numerous. Nevertheless special precautions are being taken even in places where no indigenous cases are known to have occurred. Several medical officers have been engaged in moving about among the most dangerous areas in order to supervise the measures that are being taken to inspect local conditions and to instruct local authorities, both civil and military. Sir Ronald Ross himself inspected most of the dangerous localities, and experienced entomologists have made surveys in them. A general system has been adopted for the immediate notification of all cases of malaria entering the United Kingdom from abroad, for the purpose of recording where such patients disembark and where they go when on leave or are stationed when on duty or in hospital. Health officers are informed when all such patients enter their districts, and the subsequent career of these persons is watched and a regular monthly report sent in by medical officers of all units and hospitals in the United Kingdom. These reports are collected and tabulated and studied. Up to the present no cases of indigenous malaria have been reported during the present year. Former foci of malaria in England are under minute supervision, and if new foci develop, experts will be sent to deal with the matter forthwith.

American Hospital in Ireland

A spacious dwelling house, with a large area of land attached, not far from Queenstown, has been acquired by the American naval authorities as a hospital for men in American naval vessels employed on this side of the Atlantic. Wooden dormitories to accommodate 250 sick men will be added to the present building. These dormitories will be built in America in sections and brought over to the hospital, which will be staffed by the American Red Cross.

PARIS LETTER

Paris, May 23, 1918.

Tumors of Traumatic Origin

Prof. J. L. Faure recently directed attention to tumors of traumatic origin of which Dr. Vitrac of Libourne had reported two interesting cases. One of the patients was a soldier who had been wounded, April 3, 1917, by a large shell fragment which entered the external aspect of the thigh, below the great trochanter. The fragment was arrested in the popliteal region without having wounded any of the vessels or nerves. The projectile was extracted after a very free dissection, and the patient was later evacuated. April 29, much suppuration was present; but by the middle of June, cicatrization was complete. Toward the end of the month there was noted a swelling, about the size of a nut, very hard, but not painful or tender. Naturally, it was regarded as an inflammatory mass, but little by little it took on all the characteristics of a malignant tumor. Various treatments, including specific, were resorted to, but all met with failure. The tumor continued to increase in size until it measured 18 cm. in length and from 6 to 8 centimeters in width. It was extirpated, Sept. 21, 1917. The lower pole of the tumor was encapsulated, but the upper pole was separated with difficulty from the muscles, which were more or less degenerated and lardaceous. Recovery was uneventful. The enlarged glands in Scarpa's triangle reacted favorably to radiotherapy. Histologic examination of the tumor showed it to be an angiosarcoma.

The second case was that of a mounted artilleryman who, March 10, 1916, had his left thigh pressed severely against the trunk of a tree. He was in the hospital for a month, nothing more than the ordinary signs of a contusion being found as the result of his accident. He returned to duty and had no further inconvenience until September, 1917, when he noticed a mass on the antero-external surface of his thigh. This mass slowly increased in size and also became painful. The man was operated on, March 1, 1918. The tumor was firmly adherent to the surrounding tissues and extended down to the periosteum of the femur. It was removed with great difficulty, and much bleeding was present. The tumor was of about the size of an orange. Histologic examination showed that it was an encapsulated sarcoma with much telangiectasis.

These two observations seem to prove that a sarcomatous tumor, if the diagnosis was correct, may be caused by trauma. These cases occur too often for the fact to be doubted. Faure saw a woman recently who had received a severe blow on the breast in an automobile accident. The skin was severely contused and sloughed; a scar several centimeters square formed. Several months afterward an elongated movable mass was noted under the cicatrix with all the characteristics of a benign tumor. It has not been possible to determine its exact nature because the patient has refused operation; but today, three and a half years later, the tumor is still there and growing larger.

In the discussion that followed, Broca stated that there is no scientific proof of the traumatic origin of tumors, and that in all these cases the germ of the tumor had probably been present but dormant. Mauclaire said that a distinction must be made between malignant and benign tumors. A trauma is often the evident cause of an osteoma, but he did not believe that that was the case in the production of a sarcoma. Kirmisson admitted that a trauma can, in some cases, act as a sort of stimulant or impulse to a latent neoplasm, which would not have taken on active growth except as the result of the accident. Thiéry said that in spite of the real importance of this subject, one can accept more easily the relationship of trauma with a number of other affections of unknown etiology (appendicitis, so-called local tuberculosis, tumor). Too little attention is paid, to begin with, to establishing the actual, distinct, important or probable occurrence of the trauma at the exact point where the neoplasm develops. More rigorous investigation would often show the unfoundedness of the patient's statements, even when there is no question of his sincerity. The tumor may not have developed on the precise spot that was traumatized. Thiéry does not know of a single case in which he has been able to establish even a probable relationship between the trauma and the appearance of the tumor (not including epithelial degenerations of cicatrices, of burns, etc). Chaput cited a case of trauma of the right iliac fossa by a wagon pole, which, in the course of a few weeks, was followed by the appearance of a sarcoma to which the patient, a young man, succumbed quickly. From the point of view of industrial accidents, responsibility is admitted when the occurrence of a severe trauma is established. Arrou saw a young girl who had received a trauma of the thigh, and in a few weeks a tumor, having all the appearances of a sarcoma, appeared. When that tumor was examined in the laboratory it was found to be merely an inflammatory mass.

National Headquarters for Rehabilitation of Crippled and Disabled Soldiers

The institution of this service was mentioned in a previous letter (The Journal, June 1, 1918, p. 1784). The members of the committee in charge of this work have been appointed for a period of three years. They consist of representatives of the ministry of work, of commerce, agriculture, marine, finance, public instruction and of the colonies. One of the representatives of the ministry of war is Dr. Jeanbrau, surgeon-major, of Montpellier, chief of the section of the professional reeducation of the disabled. Drs. Rieffel and Camus of Paris and several directors of the schools of reeducation are also members of the committee.

War Archives and Museum at Val-de-Grâce

Two years ago the undersecretary of state for the Service de Santé militaire ordered that the medical and surgical archives of the war be deposited in the Ecole d'application de médecine et de pharmacie militaire du Val-de-Grâce. This is situated on the rue Saint Jacques, Paris. Previously made collections and the libraries of the Ecole du Val-de-Grâce and other establishments constitute a most important educational aid, the further extension of which must be foreseen. In order to facilitate the growth and development of this institution, it has been decided to unite, in the form of autonomous establishments, the various services heretofore under the jurisdiction of the undersecretary of state of the Service de Santé militaire. The new establishment will be known as the musée du Val-de-Grâce, comprising the collection of the archives and documents of war, the central library of the Service de Santé militaire, and the archives of military medicine and pharmacy, so that all the services will be placed under the jurisdiction of the musée directors by order of the minister of war. The director of the Ecole d'application de médecine et de pharmacie militaire du Val-de-Grâce, will be *ex officio* in charge of the whole as the representative of the state war department.

Decoration of the Legion of Honor Awarded to Civilian Physicians for Devoted Services in War Time

The cross of the Legion of Honor (grade of officer) has been awarded to Dr. Langlet, mayor of Reims. Dr. Samsoen, municipal councilor of Hazebrouck, department du Nord, and Dr. Hoel of Reims have been made chevaliers of the Legion for herioc services rendered to the civilian population during the bombardments of Reims.

Promotions in the Auxiliary Medical Service

The undersecretary of state for the Service de Santé militaire has decreed that all physicians connected with the service auxiliaire, whether of the grade of médecin auxiliaire or not, shall be recommended for the grade of médecin aide-major of the second class, temporarily, if they have not yet made the request. These promotions will become effective automatically, provided the applicants have shown professional aptitude (*certificat de visite et de contre-visite* testifying to physical fitness for light medical service, for instance, in the hospitals of the *zone des étapes*), and that they will give the guarantees demanded of all officers.

Refugee Trains

One of the three societies composing the French Red Cross, the Société de secours aux blessés militaires, which has been administering to the needs of the reconstructed villages, has come to the assistance of the population of these villages when, on invasion by the enemy, they had to abandon their homes again. A service was organized at once to accompany the refugees on the transport trains. These trains which sometimes are in transit for day and night, are supplied with food by the nurses at the railroad depots where food is prepared in advance. Two nurses accompany each train until it reaches its destination. During the transit they give the occupants all the care which they need; they distribute milk to the children, give the sick warm drinks, soups and warm clothing. Each train is provided with a first aid box and a small pharmacy. Up to the first of May, thirty trips had already been made by sixty nurses of the society.

Personal

In its session of May 14, the Académie de médecine elected Dr. Theodore Tuffier a member of the section on surgical pathology, and Dr. Patein a member of the section on pharmacy. Dr. Patein is chief pharmacist of the Lariboisière hospital, and was formerly president of the Société de pharmacie and of the Société de thérapeutique.

Marriages

Lieut. Harold Linhoff Brereton, M. R. C., U. S. Army, Emmettsburg Iowa, on duty at Camp Dix, N. J., to Miss Isabel Catherine Bayne of Fergus, Ont., formerly superintendent of nurses at the L. L. Culver, Union Hospital, Crawfordsville, Ind., at Brooklyn, N. Y., April 23.

Asst. Surg. Carl James Robertson, U. S. N. R. F., Litchfield, Minn., on duty at Great Lakes, Ill., to Miss Marjorie Kohl of Wayne, Nebraska, at Evanston, Ill., May 22.

Lieut. Lawrence David Enloe, M. R. C., U. S. Army, Jefferson City, Mo.; on duty at Camp Pike, Ark., to Miss Dorothy Agee of Jefferson City, at St. Louis, June 4.

Lieut. John Andrew Saari, M. R. C., U. S. Army, Eveleth, Minn., on duty at Fort Lee, Va., to Miss Allie Miettenen of Brookston, Minn., in Chicago, June 1.

Lieut. Walter Leland Richards, M. C., U. S. Army, Pocomoke City, Md., on duty at Camp Greenleaf, Ga., to Miss Edith Coleman of Baltimore, June 8.

Lieut. Wilbur Carter, M. R. C., U. S. Army, Sherman, Texas, on duty at Fort Riley, Kan., to Miss Gladys Wolfe of Sherman Texas, April 8.

Asst. Surg. Noel Carlysle Ice, U. S. P. H. S., of Cleveland, on duty at Nitro, W. Va., to Miss Zelma Jockisch of Beardstown, Ill., June 1.

Capt. Robert Anthony Kilduff, M. R. C., U. S. Army, Chester, Pa., on duty at Camp Meade, Md., to Miss Adelade Long, June 12.

Lieut. Charles Henry Reinhardt, M. R. C., U. S. Army, to Mrs. Mary Baker, both of Chicago, at Newport News, Va., April 13.

Asst. Surg. Harvey Ross McAllister, U. S. Navy, Washington, D. C., to Miss Edith Lulu Sooy of Alameda, Calif., May 23.

P. A. Surg. Frank Haldane Haigler, U. S. Navy, Washington, D. C., to Miss Maybelle Hefferlin of Portland, Ore, June 11.

Capt. Henry Edward Meleney, M. R. C., U. S. Army, Brooklyn, to Miss Elsie Genevra Todd of Springfield, Mass., June 12.

Lieut. Walter Darrow Bayard, M. R. C., U. S. Army, Fargo, N. D., to Miss Myrtle Baker of Chicago, recently.

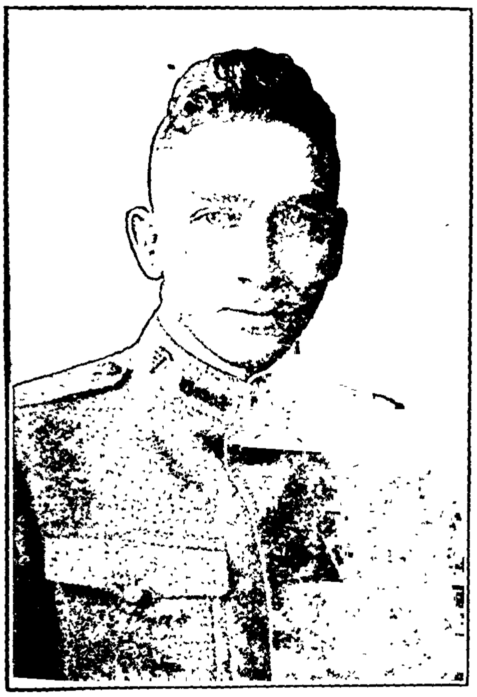
Charles Carter Cranmer, New York City, to Miss Ada Hortense Van Giesen of Hackensack, N. J., June 27.

Lieut. Frank Nevin Ogden, M. R. C., U. S. Army, to Miss Ellen Price McCarty, both of Baltimore, June 13.

William Warren Stevenson, Chicago, to Miss Caroline E. Pretzlaff, at Sibley, Ill., June 10.

Deaths

Major Eugene Wilson Caldwell, M. R. C., U. S. Army, New York City; University and Bellevue Hospital, Medical College, 1905; aged 44; a Fellow of the American Medical Association; a member of the American Roentgen Ray Association, and its president in 1907 to 1909; a member of the New York Academy of Medicine; who for more than twenty years had devoted his time almost exclusively to experimental work with the roentgen rays and their practical application in diagnosis; the inventor of the Caldwell liquid interrupter, and many other appliances used with the roentgen ray; visiting physician to the roentgen department of the Presbyterian Hospital, New York City; director of the Edward N. Gibbs Memorial X-Ray Laboratory, Bellevue Medical College; author of a standard textbook and of many monographs on the roentgen rays and telephony; died in Roosevelt Hospital, New York City, June 20, from burns sustained the day before while making roentgen-ray experiments.



Died in the Service
IN FRANCE
Lieut. Abner P. H. Sage, M. R. C., U. S. Army, 1889-1918

Thomas Cook Stellwagon, Media, Pa.; University of Pennsylvania, Philadelphia, 1868; aged 76; a Fellow of the American Medical Association; a graduate of the Pennsylvania Dental College in 1861; and for nearly half a century a dentist of Philadelphia; for many years professor of physiology in the Philadelphia Dental College, and in the Medico-Chirurgical College of Philadelphia, and one of the founders of the latter institution; a veteran of the Civil War, in which he served in the Navy; died at his home, June 7.

Ernest Varian Scribner, Worcester, Mass.; Bowdoin Medical School, Brunswick and Portland, Me.; aged 62; a Fellow of the American Medical Association; a member of the American Medico-Psychological Association; for thirty-seven years a member of the staff of the Grafton and Worcester State hospitals, and assistant superintendent and superintendent of both institutions; an alienist of high rank; for six years superintendent of the Worcester State Hospital; died at his home, June 14.

George Edward Swift, Hudson, N. Y.; Albany (N. Y.) Medical College, 1884; aged 58; a member of the Medical Society of the State of New York; health officer of Hudson and Columbia County for several terms, and visiting physician to the Hudson Hospital; second lieutenant in the National Guard of the State of New York for five years; died in the Hudson Hospital, May 31, eleven days after an operation for appendicitis.

William Summer Clark, Los Angeles; Central College of Physicians and Surgeons, Indianapolis, 1881; aged 62; a Fellow of the American Medical Association; chairman of the tree-planting committee of the Los Angeles City Club, and prominent as a civic worker; was killed in an automobile accident near Compton, Calif., June 4.

Lieut. William Louis Miller, M. R. C., U. S. Army, Saginaw, Mich.; University of Oregon, Portland, 1915; aged 28; a Fellow of the American Medical Association; a registered pharmacist; on duty with Ambulance Company No. 128, Sanitary Train No. 107, Thirty-Second Division, American E. F. in France; was killed, May 28.

Valentine Mott, New York City; Bellevue Hospital Medical College, 1878; aged 65; a Fellow of the American Medical Association; attending surgeon, outdoor department, Bellev Hospital; one of the earliest exponents of the Pasteur pr phylactic treatment for hydrophobia; died in New York Cit June 20, from angina pectoris.

James Livingston Wilgus, Chicago; Medical College Indiana, Indianapolis, 1896; a Fellow of the American Med cal Association; while driving in his automobile, over a lev crossing near Grand Beach, Mich., was struck by a Michiga Central train, June 7, and died from his injuries a few hou later in a hospital at South Bend.

Charles Perkins Cook, Churchtown, N. Y.; New Yo Homeopathic Medical College, New York City, 1868; aged 7 for thirty years physician to the Hudson Orphan Asylun for several years health officer of the city and once assista surgeon-general of the state; died at the home of his son Brookline, Mass., May 28.

Lieut. David Mays Vogt, M. R. C., U. S. Army, Newman town, Pa.; University of Pennsylvania, Philadelphia; aged 3 on duty at Picatinny Arsenal, Dover; was injured by t overturning of his automobile near Millburn, N. J., and di in the Overbrook Hospital, Summit, N. J., May 30, from h injuries.

Major Woods Walker Lynch, M. R. C., U. S. Army, Mi land, Texas; University of Texas, Galveston, 1899; aged 4 on duty at Base Hospital, Camp Sheridan, Montgomery, Ala formerly a Fellow of the American Medical Association; member of the State Medical Association of Texas; die June 9.

William Vestus Balch, Galway, N. Y.; College of Phy cians and Surgeons in the City of New York, 1871; aged 6 health officer of Saratoga County; vice president of t board of managers of the Homestead Sanatorium and t Saratoga County Tuberculosis Hospital; died at his hon June 5.

Michael Gramling Salley, Orangeburg, S. C.; University Maryland, Baltimore, 1872; aged 68; formerly a Fellow the American Medical Association; a member of the Sou Carolina Medical Association; died at the home of daughter in Colu bia, S. C., June from angina pector

Died in the Service
IN FRANCE
Lieut. William L. Miller, M. R. C., U. S. Army, 1890-1918

Charles Herbe Williams, Bosto Harvard Medic School, 1874; ag 67; a Fellow of t American Medical A sociation, and a me ber of the Americ Ophthalmological S ciety; a well kno specialist on disea of the eye; died at home in Cambrid June 9, from he disease.

Lieut. Abner Po Hubert Sage, M. R. U. S. Army, Memph Tenn.; Jefferson Me ical College, 191 aged 29; a memb of the Tennessee Sta Medical Associatio on duty with a Briti field ambulance France; died, May 3 from wounds receive in action.

John William Har ris, Eugene, Ore. Willamette Universi ty, Salem, Ore., 1884 aged 64; formerly a member of the Oregon State Medica Association; was found dead, June 7, in Hendricks Par near Eugene. His death is believed to have been due t exhaustion.

John Merritt, Brooklyn; Long Island College Hospita Brooklyn, 1875; aged 72; for several years attending physicia at the Sheltering Arms Day Nursery, Brooklyn; died at h home, March 9, from senile debility.

Orlando Benedict Mayer, Newberry, S. C.; Medical Co lege of South Carolina, Charleston, 1874; aged 64; formerly Fellow of the American Medical Association; died recently.

Henry R. Watts, Baltimore; University of Maryland, Baltimore, 1864; aged 75; a veteran of the Civil War, in which he served in the Navy, afterward appraiser in the Baltimore Custom House; for twenty years a pharmacist; died at his home, May 24.

Leo Joseph Flanagan, South San Francisco, Calif.; Georgetown University, Washington, D. C., 1911; aged 32; formerly a member of the Medical Society of the State of California; died in St. Mary's Hospital, San Francisco, June 11, from pneumonia.

Gilbert Emanuel Anderson, North Bend, Ore.; Barnes Medical College, St. Louis, 1911; aged 36; a member of the Oregon State Medical Association; died at his home, June 10, from septicemia, following an infected wound of the thumb.

Robert Graham Ralston, Cowansville, Pa.; Jefferson Medical College, 1860; aged 88; a member of the Medical Society of the State of Pennsylvania; for fifty-seven years a practitioner of Cowansville; died at his home, May 23.

Edwin G. Cowperthwaite, Philadelphia; Hahnemann Medical College, Philadelphia, 1895; aged 44; for several years a member of the staff of the eye dispensary of the Hahnemann Hospital, Philadelphia; died at his home, June 11.

Cleveland James Shambaugh, Cherry Valley, Ill.; Bennett Medical College, Chicago, 1911; aged 32; who was overcome by heat, June 16, committed suicide by cutting his throat in a garage in Cherry Valley, June 17.

Lieut. Charles Francis Butler, M. R. C., U. S. Army, Pittsburgh; Medico-Chirurgical College of Philadelphia, 1915; aged 23; a member of the Medical Society of the State of Pennsylvania; died, June 4.

Frederick Weygandt, Brooklyn; College of Physicians and Surgeons in the City of New York, 1875; aged 70; formerly a member of the Medical Society of the State of New York; died at his home, June 12.

Joseph J. Back, Newport, Ky.; Medical College of Ohio, Cincinnati, 1902; aged 39; formerly a member of the Kentucky State Medical Association; died at his home, June 9, from tuberculosis.

William S. Town, Rockford, N. Y.; University of Buffalo, N. Y., 1880; aged 64; health officer of Niagara County, and of the town of Cambria; died at the home of his brother in Newfane, June 8.

Adelaide Eliza Thomas, Florence, Mont.; State University of Iowa, College of Homeopathic Medicine, Iowa City, 1896; aged 77; died in Carleton, Mont.; June 10, from cerebral hemorrhage.

John Edwin Urqhart, Ashfield, Mass.; University of Maryland, Baltimore, 1883; aged 58; a Fellow of the American Medical Association; died at his home, June 14, from cerebral hemorrhage.

Lewis Edward Harvie, Danville, Va.; Medical College of Virginia, Richmond, 1867; aged 75; a member of the Medical Society of Virginia; a Confederate veteran; died at his home, recently.

Kenney N. Miller, Houston, Texas; University of Louisville, Ky., 1884; aged 58; a Fellow of the American Medical Association; died at his home, June 13, from heart disease.

Carl Louis Muller, Nevada City, Calif.; Jefferson Medical College, 1888; aged 56; a Fellow of the American Medical Association; died in a hospital in San Francisco, June 11.

William C. Kelly, Flint, Mich.; Milwaukee (Wis.) Medical College, 1897; aged 61; a member of the Michigan State Medical Society; died at his home, June 8.

Donat F. Racicot, Biddeford, Me. (license, Maine, Act of 1895); aged 59; a practitioner for more than twenty-five years; died at his home, June 13.

Thomas Banter Hopper, Jersey City, N. J.; Bellevue Hospital Medical College, 1891; aged 52; died at his home, April 8, from pneumonia.

Neal Baker Dean, Alexander City, Ala.; Tulane University, New Orleans, 1905; aged 34; died at his home, May 9, from bronchopneumonia.

Howell Cobb Davies, Youngstown, Ohio; University of Pittsburgh, 1897; aged 42; died at his home, June 9, from pernicious anemia.

Stephen W. Gerrow, New Paltz, N. Y.; Castleton (Vt.) Medical College, 1856; aged 83; died at his home, June 13.

James Roderich Berwick, Methuen, Mass.; Dartmouth Medical School, Hanover, N. H., 1899; died suddenly, June 1.

A. N. Snoddy, Dayton, Ind.; Medical College of Ohio, Cincinnati, 1859; aged 84; died at his home, June 12.

Correspondence

UNRIGHTEOUS PROFITS IN PATENTED PRODUCTS

To the Editor:—In line with Dr. Bevan's address in regard to leaving German scientists and preparations alone and using American, I will state that "Aspirin Bayer" decreased in price from $8.80 to $4.40 per thousand at the time their patent expired, about eighteen months ago. The foregoing were prices I paid at that time, being a retail druggist. Physicians, not druggists, paid more. They were charging $4.40 per thousand above legitimate profit or they would not have reduced the price that amount when their protection expired. I wonder how many millions of these $4.40 went to help the kaiser.

The government should protect a patentee (if not a Hun) but should not allow him to collect cost plus a legitimate profit and then double the charge.

C. H. Harris, M.D., New Paris, Ohio.

Queries and Minor Notes

Anonymous Communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted, on request.

SERVICE FLAG—SALUTING THE COLORS

To the Editor:—1. Is the service flag intended for the Army and Navy service and their branches, the fighting men and the necessary men connected with each service aside from the fighting men, or does it also include Red Cross nurses? 2. Can you give me any information relative to the method of saluting the colors and of responding to the national air?

M. Bachman, M.D., Lake Park, Iowa.

Answer.—1. The service flag is displayed for those in the active service of the Army or the Navy of the country; Red Cross nurses on active duty with the fighting forces should be included.

2. Existing regulations governing the Army provide that when officers and enlisted men pass the national flag they will render homage as follows: If in civilian dress and covered, they will uncover, holding their head-dress opposite their left shoulder with their right hand; if uncovered, they will salute with the right-hand salute. Whenever the national air is played at any place where persons belonging to the military or naval service are present, all officers and enlisted men not in formation are required to stand at attention, facing toward the music, except when the flag is being lowered at sunset, on which occasion they are required to face toward the flag. If in civilian dress and uncovered, they should stand and salute at the first note of the air, retaining the position of salute until the last note of the air is played. If in civilian dress and covered, they are required to stand and uncover at the first note of the air, holding the head-dress opposite the left shoulder until the last note is played. In inclement weather only the head-dress may be held slightly raised. There are no laws on this subject governing the conduct of civilians, but unwritten law and excellent custom suggest that civilians act with equal courtesy toward the national colors and anthem.

THE THOMPSON MALTED FOOD STOCK PLAN

To the Editor:—About the middle of March a good many medical men here were induced to buy stock in Thompson's Malted Milk Co. of Waukesha, Wis. I bought to the amount of $45 cash. Others bought more and some less—the stock certificate sent me was for. thirty shares at $1.50 per share.

The party who sold the stock was in town for at least two days. He told me that he was just out of New Orleans and had sold every doctor (not surgeons) of prominence in the place, gave the names and amount of stock taken and claimed that he had remained there while letters, etc., as to his reliability and that of the T. M. M. Co. was investigated. Said that he had cheerfully invited this investigation, etc.; said the Mayos used the malted milk exclusively in their hospital in Rochester; that the U. S. government had a big order for all the product they could get and preferred it to Horlick's or any other milk. Said that as soon as the doctors, who were preferred, bought stock it would be offered to the drug stores. None was offered to any here I am told.

I told him I did not like the scheme as it did not look all right to me, but that I'd take a few shares, but wanted to know just what the stock was going to pay—I couldn't pin him down to exact figures, but he said I could not possibly lose and would have a nice little side-line that would come in very handy as the company had no debts and had paid for its plant and was selling stock in this manner, interesting doctors instead of advertising in the medical journals. By doctor's owning stock they would recommend this milk as it was the best and purest anyway. He never did say just how much the stock would pay, but said that there was no possible way for an investor to lose any money.

Do you know anything about this company? The man who sold us the stock said that it would be in every drug store here right away. I haven't yet seen any. R. L. Randolph, M.D., Alexandria, La.

Answer.—Seven years ago physicians were told of the glowing prospects that might follow an investment in the Thompson's Malted Food concern; we have yet to hear of any dividends being paid. The Thompson Malted Food Company was discussed in the Propaganda Department, Oct. 24, 1914; it was again discussed in the Correspondence Department, April 28, 1917. A reprint of both these articles will be sent on receipt of a two-cent stamp.

THE BABINSKI TEST

To the Editor:—1. Who is, or was, Babinski? 2. What is the Babinski test? Henry Ketcham, Dallas, S. D.

Answer.—1. Joseph François Felix Babinski was born, Nov. 17, 1857, of Polish parents. He was graduated in medicine in 1885, and in 1890 was appointed physician to the Hôpitaux de Paris. He is noted for his original studies on the subject of brain diseases and the diagnosis and treatment of vertigo. He is a French neurologist and is living at the present time.

2. The Babinski phenomenon consists of a stimulation of the sole of the foot producing extension of the hallux (great toe) instead of flexion. The normal plantar reflex is one of flexion of the great toe, while Babinski's plantar reflex is one of extension. Sometimes, in testing for Babinski's sign, in addition to extension of the hallux, a fanlike spreading out of the toes is observed—*phénomène d'éventail*. The presence of the reflex indicates a disordered and usually degenerated condition involving the pyramidal tract. It is, therefore, of value in differentiating between functional and organic nervous diseases.

COMMUTATION AND INSURANCE IN NAVY AS WELL AS IN ARMY

To the Editor:—1. Do officers in the Navy receive commutation the same as officers in the Army? 2. Are Naval officers allowed to carry government insurance at the same rate, etc., as officers in the Army? 3. Where do I report for examination? Please omit my name.

A. R. W.

Answer.—1. Yes.

2. Yes.

3. You may write to the Office of the Surgeon-General of the Navy, or to The Journal office, requesting an application blank, which may be forwarded to the Surgeon-General of the Navy accompanied by a request for examination before the nearest examiner.

PHYSICIANS INVITED TO CONTRIBUTE INFORMATION ON HAY-FEVER RESORTS

To the Editor:—In order to furnish reliable information to the large number of inquirers, we are preparing a list of places in various parts of the country where hay-fever subjects may find temporary relief. Physicians are therefore requested to assist in this work by sending a list of places, in their state, having the reputation of being free—or relatively free—of hay-fever.

The United States Department of Agriculture and the members of our botanical department are preparing a list of localities in relation to hay-fever from a botanic standpoint, but the report of physicians on this subject will aid greatly in establishing, for the benefit of the medical profession and the public generally, definite information on this subject.

William Scheppegrell, M.D., Audubon Building, New Orleans,
President, American Hay-Fever Prevention Association.

To Arrest Paroxysmal Tachycardia.—According to a German writer, cited by *Hospitalstidende*, tickling the palate and throat, until vomiting is induced, will arrest an attack of paroxysmal tachycardia.

New York March Examination

Mr. George M. Wiley, director, Examinations and Inspections Division, reports the written examination held at New York, March, 1918. The examination covered 8 subjects and included 80 questions. An average of 75 per cent. was required to pass. Of the 123 candidates examined, 115 passed and 8 failed. The following colleges were represented:

College	Year Grad.	Total No. Licensed
PASSED		
Harvard University	(1918)	2
Columbia University	(1918)	40
Fordham University	(1918)	40
New York Homeo. Med. Coll. and Flower Hosp.	(1918)	4
University and Bellevue Hosp. Med. College	(1918)	29
FAILED		
Columbia University	(1918)	3
Fordham University	(1918)	3
New York Homeo. Med. Coll. and Flower Hosp.	(1918)	1
University and Bellevue Hosp. Med. College	(1918)	1

Nevada May Examination

Dr. S. L. Lee, secretary of the Nevada State Board of Medical Examiners, reports the written examination held at Carson City, May 6-8, 1918. The examination covered 13 subjects and included 100 questions. An average of 75 per cent. was required to pass. One candidate was examined, who passed. Five candidates were licensed through reciprocity. The following colleges were represented:

College PASSED	Year Grad.	Per Cent.
Rush Medical College	(1913)	93.4

College LICENSED THROUGH RECIPROCITY	Year Grad.	Reciprocity with
Georgia College of Eclec. Med. and Surg.	(1899)	Texas
Rush Medical College	(1903)	Illinois
Barnes Medical College	(1893)	Missouri
Dartmouth Medical School	(1899)	Maine
Temple University	(1914)	Penna.

Iowa Reciprocity Report

Dr. G. H. Sumner, secretary of the Iowa State Board of Medical Examiners, reports that 12 candidates were licensed through reciprocity at the meeting held May 1, 1918. The following colleges were represented:

College LICENSED THROUGH RECIPROCITY	Year Grad.	Reciprocity with
Bennett Medical College	(1914)	Illinois
Chicago College of Med. and Surg. .(1909) Illinois;	(1915)	Nebraska
Chicago Medical College	(1877)	Wisconsin

Hering Medical College	(1907)	Illinois
National Medical University	(1902)	New Mexico
Northwestern University	(1914)	Illinois
Maryland Medical College	(1912)	New Hamp.
John A. Creighton Medical College	(1915) (1917)	Nebraska
Ohio Medical University	(1907)	Ohio
Jefferson Medical College	(1916)	Wisconsin

Medicolegal

Liability of Company and Physician Under Contract for Medical Services

(Sloss-Sheffield Steel & Iron Co. et al. v. Taylor (Ala.), 77 So. R. 79)

The Court of Appeals of Alabama affirms a judgment for $300 damages in favor of the plaintiff, Mrs. Taylor, and against the defendants, the company and the "company doctor," who were sued jointly of alleged failure to render medical services to the plaintiff. The court says that it appeared that the company deducted 75 cents each month from the wages of its unmarried employees, and $1 each month from the wages of its married employees, and in consideration of this amount the company obligated itself, in the case of a married man, to render, in case of illness, medical services to him, his wife, and family. The "company doctor" was employed by the company to render medical services to its employees, and their wives and families, under this agreement. February 9, the company deducted $1 from the wages of the plaintiff's husband, 90 cents being paid to the physician, and 10 cents being retained by the company. March 5, the plaintiff was taken ill, and the physician was repeatedly requested, on the 5th, 6th and 7th, to visit her, but each time refused to do so, though, acting on Mr. Taylor's statement of the nature of his wife's malady, he furnished some medicine or phenolated petrolatum and codein tablets to Mr. Taylor to be administered to his wife, stating that it was unnecessary to make a professional call. On the evening of the 7th, Mr. Taylor called in another physician. It developed that Mrs. Taylor was suffering from an abscess, and by the 10th, when the defendant physician did call on her, had so far recovered as not to be in need of the services of a physician, the abscess having burst. The defendant admitted having told Mrs. Taylor's sister that he would treat Mrs. Taylor if she would take her to her house; that he would not go to Mr. Taylor's house to see her; that he did not want to have anything to do with a man that would take a case away from him and take another physician without consulting him. This was before March 9.

The court holds that the husband was under a legal duty to provide medical services and attention for his wife, when needed, so far as his ability would permit; and his contract with the defendant to render such services to her was a contract for her benefit, and the breach of it gave her the right to maintain an action therefor in her own name, either for the breach of the contract or for the negligent failure, if such there was, to perform the duty arising out of the agreement. After the defendants had entered into the agreement, it was not permissible for them to refuse to perform their part thereof, because the husband exercised his right to call in another physician. The husband was under no duty to notify the company doctor that he would call in another physician, and he was under no duty to employ only such physician as was acceptable to the professional taste of the company doctor. When the defendants entered into a valid contract to render professional services to Mrs. Taylor up to March 9, as the evidence tended to show they did, the law required them to perform their contract, and render such professional services as might be required of them up to that time, and their nonperformance could not be excused because other professional skill was obtained without their consent, unless it appeared that the additional physician materially interfered with the defendants in the discharge of their duty. It was urged that there could be no recovery in this case because a contract made by a husband for medical services to his wife is a contract made for the benefit of the husband, since he is under a legal duty to provide medical services for his wife in case of illness, and therefore the wife is only incidentally benefited by such a contract. But the fact that the husband was under such legal duty was one reason why the wife was entitled to maintain this action in her own name. The contract had for its purpose the preservation of the wife's life and health by placing at her disposal the professional skill and services of the company doctor. The benefit to her was direct and substantial. This court would find it difficult to hold otherwise, and at the same time maintain its self-respect.

The court cannot say that the damages awarded were excessive.

Value of Services Is Question for Jury

(Young v. Lichtenberg (N. Y.), 168 N. Y. Supp. 616)

The Supreme Court of New York, Appellate Term, First Department, which reverses a judgment obtained by the plaintiff, a physician, says that he brought this action against the defendant for the value of medical services rendered to the defendant at his request. The plaintiff testified at the trial as to his services and as to their reasonable value. His testimony was not contradicted. At the close of the testimony the defendant moved to dismiss the complaint, and his motion was denied. The plaintiff thereupon moved for the direction of a verdict, and the court directed one in his favor for $157, the amount demanded in the complaint and which the plaintiff had testified was the reasonable value of the services rendered. Thereafter the defendant asked to go to the jury on the question of fact involved in the determination of the value of the services. This motion was denied. The defendant's request to go to the jury on the question of fact was not made too late, and the only serious question presented by this appeal was whether, in view of the fact that the plaintiff's testimony as to the value of his services was uncontradicted, there was any question of fact that the jury could determine. It was conceded that, in actions brought by attorneys for the value of professional services, the jury must assess the value of such services, even when there is no contradiction of the testimony adduced by the plaintiff as to the value of his services. Even though no case was cited in which the same rule has been announced by any court of this state in regard to services rendered by a physician, this court can see no possible distinction in principle as to the conclusiveness of expert opinion in regard to the value of professional services, in actions brought to recover for services rendered as an attorney and in actions brought to recover for services rendered as a physician. It follows that the judgment for the plaintiff should be reversed, and a new trial ordered, with $30 costs to the defendant to abide the event.

"Surgeon Not Liable for Sponges Being Left in Patient"—Standard of Diligence

(Cassingham v. Berry (Okla.), 168 Pac. R. 1020)

The Supreme Court of Oklahoma was reported in the Medicolegal Department of The Journal, Sept. 4, 1915, under the quoted heading, as having, in *Cassingham et al. v. Berry*, affirmed a judgment in favor of the defendant, and denied a rehearing, the action being one against a surgeon for having, as was alleged, negligently left gauze sponges in the body of the plaintiffs' mother, on whom the defendant had operated for the removal of the ovaries, which alleged negligence, it was charged, resulted in the death of the patient.

Now, on a rehearing, the court says that the one question involved in this case on which it has had misgivings was the doctrine that the degree of diligence that the law imposes on the surgeon is reasonable or ordinary care. The court earnestly requested and hoped that counsel in the argument on rehearing would give the court light on this question. But counsel did not cite, nor has the court been able to find, an instance in which the courts of law impose any standard of diligence on any one, other than reasonable and ordinary care. It is true this is a relative term. What would be reasonable and ordinary care under some conditions would be negligence under others. The importance, delicacy, hazard and moment of the undertaking all enter into the question as to what, under the circumstances, amounts to reasonable and ordinary care, and is a question of fact for the jury.

In the case at bar the evidence was that the defendant before beginning the operation counted the sponges to a trained nurse, who had been furnished by the husband of the patient, and repeatedly admonished her to keep an accurate count of the number of sponges inserted into the cavity, and did all he could to impress on her the importance of her accurately counting the number of sponges taken from the cavity, to insure that none that had been inserted remained in the cavity, and that, before closing the cavity, he asked the nurse if she had counted the sponges, and if all that had been inserted had been taken out of the cavity, and she assured him that she had counted them, and that they had all been taken out. It was also in evidence that this was an approved method, used by many leading surgeons, of keeping track of the number of sponges used in an abdominal operation.

And, under the law on diligence and the facts in this case, the court adheres to the opinion originally filed. All the justices concur.

The syllabus by the court says: The law imposes but one standard of diligence, and that is reasonable and ordinary care. This, however, is a relative term; and what would be reasonable and ordinary care under some conditions would amount to negligence under others. The importance, delicacy, hazard and moment of the undertaking all enter into the question as to what, under the circumstances, amounts to reasonable and ordinary care.

Remedy Where Board Revokes Certificate

(Knoop v. State Board of Health (R. I.), 102 Atl. R. 609)

The Supreme Court of Rhode Island dismisses a writ of certiorari—a writ to call up records or for review that was issued on a petition therefor. The court says the writ was sought for the purpose of quashing a record setting out the action of the members of the state board of health, whereby the certificate authorizing the petitioner to practice medicine and surgery in that state was revoked on the finding of the board that the petitioner had been guilty of gross unprofessional conduct and conduct making him an unfit person to practice medicine in the state. From the allegations of the petition it appeared, among other things, that the board served notice on him to appear before it on a certain date, and show cause why his certificate should not be revoked, and on or about said date gave him a bill of particulars in which it was alleged that he had been dispensing and distributing narcotic drugs in violation of the Harrison act, and in the United States District Court for the District of Rhode Island he had pleaded nolo contendre (I do not wish to contend) to an indictment found against him for violation of said act, and thereupon had been sentenced to pay a fine of $100; also that he had violated the provisions of the state statute by illegally prescribing various narcotic drugs, etc. In his brief the petitioner stated that he brought his petition for a writ of certiorari solely because the remedy which was open to him by way of appeal was utterly inadequate, because not only would he have to bear the burden of the cost of an appeal, but he must be without compensation and redress for what he styled the wrongful and summary procedure of the state board of health, and that his situation presented just such a case of unusual hardship as should appeal to the discretionary powers of this court for relief by certiorari.

Assuming, simply for the purpose of this discussion, that the contention of the petitioner was sound that the record of the indictment above referred to was not proper or adequate evidence to support the decision of the board, this court is of the opinion that the appropriate remedy of the petitioner was by appeal, and that no such exceptional case of hardship was presented as to warrant a review of the proceedings by certiorari. From the transcript of the testimony taken in the proceedings before the board of health, which was used by the parties to the hearing before this court on the motion and petition, it appeared that there was other evidence in addition to the record of the indictment produced before the board. It was true that the board apparently based its decision on the record of the plea of nolo contendere and sentence thereon; nevertheless there was other evidence presented to the board which was relevant to the issue, and in proceedings under the statute the remedy provided by appeal was simple and adequate; and this court cannot review by certiorari the question as to the adequacy of the evidence.

As the appeal vacates the proceedings before the board, so far as results go, the case on such appeal comes before this court for a trial on the merits of the case de novo (anew), and the fact that such trial may impose some additional expense on the petitioner does not differentiate this case from the ordinary case in which appeal is taken from the decision of an inferior tribunal which is claimed to be erroneous.

MEDICAL SOCIETY OF THE STATE OF NEW YORK

One Hundred and Twelfth Annual Meeting, held at Albany, May 21-23, 1918

(Concluded from page 1977)

Etiology of Nephritis

Dr. Charles Jack Hunt, Clifton Springs: A group of nephritics, without other etiologic factor than bacterial toxins that formed chronic foci, were studied by recognized renal functional tests under control diet both before and after removal of discoverable foci. Culture study revealed the *Streptococcus mucosus* as the principal pathogenic organism. Other bacterial forms, in the order of frequency, were a diphtheroid organism, *Bacillus mitis, Streptococcus candidus, Streptococcus viridans,* and the pneumococcus.

DISCUSSION

Dr. Charles G. Stockton, Buffalo: These cases are due primarily either to infection alone or to a mixture of infection and metabolic defect. I have seen rather acute types of nephritis, with marked metabolic disturbances following infection, the infection producing anasarca and cerebral symptoms of a grave character, yet I have seen those disturbances pass off without any apparent after-effect on the kidney. I have in mind a woman who went through a gestation safely, who at one time seemed to be a hopeless nephritic. In her case I feel convinced that the reason for relief was the removal of the tonsils and subsequently the careful regulation of diet and studies of the blood.

Pathology of Nephritis

Dr. Herbert U. Williams, Buffalo: The pathology of nephritis is in a rather confused state. The old classification of nephritis is simple, but it has been modified considerably in the course of time to secure a more exact classification, and nearly every one divides nephritis now into tubular and glomerular. The chronic form of glomerular nephritis is held by many to be identical with chronic interstitial nephritis. There is great difficulty in separating these from the arteriosclerotic kidney, which resembles it closely in many cases. It is exceedingly difficult to draw a hard and fast line between the different types of nephritis not only clinically but also anatomically. To be perfectly safe, one should call every case of nephritis diffuse. The epithelium of the tubules undergoes postmortem changes. The kidney of a normal subject, which has had time to undergo postmortem changes frequently shows alterations that are quite difficult to differentiate from what is normally called cloudy swelling. The epithelium of the convoluted tubules is exceedingly sensitive, and in various conditions of bacterial toxemia or in poisoning by metals and other agencies there are marked degenerative changes in the epithelial cells. Albuminous degeneration of the epithelial cells, fatty degeneration and desquamation are seen frequently in this class of cases. It is seen in mercuric chlorid poisoning, in the acute toxemias like diphtheria and septicemia, in acute yellow atrophy of the liver, and so on. In many cases there are clear evidences of inflammation in the form of exudation into the tubules, and frequently leukocytes in and around them, and sometimes blood. Many of these cases show alterations in the glomeruli at the same time. The moderately pure type of this form of nephritis is more common than glomerular nephritis. There is a tendency to attribute the granular contracted kidney to earlier attacks of glomerular nephritis. The formation of new fibrous tissue in a kidney leading to chronic interstititial nephritis seems more and more to be attributed to the formation of fibrous tissue in response to a loss of substance rather than as a result of irritation.

We are not able at present to connect the pathologic anatomy very closely with changes in function. The classification of nephritis into glomerular, tubular, the late glomerular, the chronic interstitial, and the arteriosclerotic types is quite generally adopted, and the most interesting point is that of determining the relation of focal infection to glomerular nephritis by finding that it is caused by bacterial emboli and not entirely through the agency of toxins. Finally, a number of very high authorities are of the opinion that granular contracted kidney is closely connected with the arteriosclerotic kidney, and hard to distinguish from the latter, very largely the late results of an earlier glomerular nephritis, and possibly repeated attacks of glomerular nephritis. Mallory says that a patient who recovers from his toxemia and from his acute attack may suffer almost equally from the reparative changes that occur in the kidney.

Treatment of Chronic Nephritis

Dr. John R. Williams, Rochester: The most common type of kidney disease seen is that occurring in the middle aged adult who complains of some or all of the following symptoms: tiring easily, occipital headache, shortness of breath, high blood pressure, and little or no physical evidence of kidney disturbance except frequent and excessive urination at night. The blood is commonly low in urea, creatinin and phosphates. The blood sugar may be high. Edema is usually not present. Death is caused rarely by uremia, and more often by cerebral hemorrhage or failing heart. This is the well known cardiorenal type.

The next most frequently seen type is the middle-aged or even younger adult who may have pronounced eye symptoms, edema, low or high blood pressure, very little kidney reserve, urine loaded with albumin and casts, blood containing two or three times the normal amount of urine, a high blood sugar, increased blood creatinin, and phosphate retention. Death is commonly preceded by convulsions and the phenomena of uremia.

The last and much less frequently seen type is that of the young or middle-aged adult in whom the chief findings are edema, weakness, pallor, and not albuminuria, blood urea, and low sugar, perhaps lower than normal. The cholesterin content of the blood may be increased greatly; edema may or may not be influenced by the salt content of the diet. The functional capacity of the kidney is fairly normal to the usual clinical tests. The patient suffers very little headache or from other symptoms commonly seen in kidney failure.

The first and one of the most important steps in the treatment of any type of kidney disease is to rid the body of all focal infections. In the treatment of the cardiorenal type, if the patient is not harboring infection, the most important measure is rest, both mental and physical. If the patient has a good functional kidney capacity, he should be put on a low, simple, general diet. All chemical irritants and foods containing quantities of animal extractives, bacteria and bacterial products should be excluded from the diet. The patient should be allowed to have some meat and eggs. In severe cases of the second type the best measure is to put the patient at rest and give him a limited milk and fluid diet, as suggested by Karrel. I prescribe for the first few days 1 quart of milk, 1 pint of water, and either another pint of lime water or some salt of calcium, either the carbonate or the lactate, in half gram doses, several times daily. The tincture of iron or ferrous carbonate, in liberal doses, is also given. In the third type the diet should be more liberal and should contain a large amount of protein. As many as from 8 to 10 ounces of meat may be very helpful. Fluids should be restricted. If there is evidence of salt retention, its use should be curtailed; otherwise it may be sparingly permitted.

DISCUSSION

Dr. A. F. Chase, New York: Weakness, anemia, and deficiency of the blood can be overcome by large amounts of eggs, meat and albumin. I do not give a large protein diet owing to the number of cases of mixed types. In the interstitial type of nephritis, in which there is considerable retention of products of nitrogen metabolism in the blood, one should give a low protein diet to maintain body strength. There has been great danger in giving too low a diet. The pendulum has swung too far in efforts to eradicate sugar quickly from the urine and by lowering the amount of protein in the blood too quickly. For this reason I do not agree with Dr. Williams in giving too low a diet because one must consider the patient's body strength. There is a distinct advantage in giving mineral salts. A patient with interstitial nephritis should take a large vegetable diet, with an ample amount of mineral salts in the right proportion to overcome the tendency to anemia. In this type of cases profound anemia is not given sufficient attention. The reason the general practitioner does not give heavy vegetables in nephritis is that the patient will not take them; but one can give an intelligent patient vegetables if they are puréed, mashed thoroughly and put through a colander. In this way one can make use of a large variety of vegetables. I give calcium in adequate quantities to eliminate phosphates.

Dr. A. A. Jones, Buffalo: In discussing the pathology of nephritis we should bear in mind the changes that occur in the kidney in cases classified clinically as purely interstitial, purely cardiorenal, or purely parenchymatous. Some years ago we were apt to disregard the glomerular element in chronic nephritis and to look on the cardiorenal cases as primarily interstitial cases. The glomeruli do not suffer early from the changes occurring around the tubules. The interstitial changes follow cellular changes in the glomeruli, and there is destruction of many of the glomeruli before an abundant interstitial new formation occurs. In the treatment one should include careful consideration of the causes of the disease if they can be discovered, so that focal infections should receive attention as carefully as dietary regulations.

Capt. Thomas W. Jenkins, Albany: We have had several cases of acute nephritis among the soldiers. One patient, who died following an attack of mumps, had only albuminuria. The kidneys did not show any marked change. In one case that interested me more than any other the patient was a man who, through intensive training for a commission, became ill after paratyphoid inoculation and developed one of the worst cases of nephritis I have ever seen. His urine was loaded with epithelium, and he died in the second week of illness.

Dr. Albert E. Larkin, Syracuse: Many of these patients are affected in more than one part of the kidney, and for that reason each case demands individual treatment. It is difficult to lay down any hard and fast rules of treatment. All are agreed that the best treatment for them is the same as for arteriosclerosis, namely, prevention.

Dr. Joseph R. Wiseman, Syracuse: The work of Dr. Hunt is particularly praiseworthy. In those cases in which a streptococcus was found, Dr. Hunt thinks that the tonsil is a dangerous one and should be taken out, and according to his case reports he has obtained excellent results, although one now and then sees patients with chronic nephritis and diseased tonsils in whom the removal of the tonsils is not followed by improvement.

Dr. Herbert E. Sperry, Rochester: I should like to ask how often nephritis is caused by syphilis.

Dr. Weinstein, New York: I have always been under the impression that nephritis, like a degenerative process in any other organ, is due to some infection. In two or three generations of one family one will find that the offspring are apt to suffer from nephritis as if there was a specific liability of some particular tissue to disease. With regard to diet, I have put patients on a rather low protein diet and am never afraid of the color of meat. I allow a patient to have good steak or poultry, provided it is not taken in excessive quantity. The Karrel diet is a well etablished therapeutic procedure in cases of nephritis with edema. In cases with high blood pressure one should not forget to employ digitalis.

Dr. Albert A. Epstein, New York: There is a uniformity of opinion regarding the renal type of disease in which the disturbances are purely metabolic. There is no reason why the renal function should not be concomitant with the metabolic disorder, so that there are cases in which there are mixed conditions. In such cases the method of treatment must be somewhat different from the one set down originally.

Dr. Herbert U. Williams, Buffalo: In cases of congenital syphilis the body is found riddled with organisms and gummas in the kidney. In regard to focal infections, one method of great value would be to examine the urine for long periods for organisms.

Prognosis of Surgical Tuberculosis of Kidney

Dr. William F. Braasch, Rochester, Minn.: In considering nephrectomy for early unilateral tuberculosis, the factors to be considered are age, sex, coincident tuberculosis in other organs or tissues, the duration of the symptoms, the severity of the infection of the urinary tract, and whether there is or is not bilateral involvement. Renal tuberculosis occurs from 25 to 40 years of age. Beyond the age of 60 or 70 years renal tuberculosis is of rare occurrence. We have operated on three patients up to 10 years of age. In the meantime, we have seen forty cases in children up to 10 years of age, not operated on because renal tuberculosis in children is very frequently a part of a general tuberculosis. The children on whom we have operated were seen early, and tuberculosis was not found present elsewhere. It is customary not to operate on children at once, because the majority of patients sooner or later show other evidences of tuberculosis and their resisting power will be low.

The time to operate is between 25 and 40 years of age, as the mortality increases steadily with the advance in years. The greatest mortality occurs in patients from 50 to 70 years of age. The lowest mortality from operative intervention occurs in patients from 15 to 20. The influence of complications on the mortality is important. The majority of patients have evidences of tuberculosis in other organs of the body. In only 5 per cent. was the renal tuberculosis complicated by acute pulmonary tuberculosis. Ninety per cent. of the cases of renal tuberculosis had evidences of an old pulmonary tuberculosis. Of the cases of pulmonary tuberculosis complicated by renal tuberculosis, twenty-one in number, 40 per cent. terminated fatally, which is twice as high as the mortality from renal tuberculosis uncomplicated by pulmonary tuberculosis. However, if we had not operated on patients with both pulmonary and renal tuberculosis, they all would have died. It is inconceivable to think of a spontaneous cure of renal and pulmonary tuberculosis.

The removal of the epididymis when enlarged or markedly inflamed, with secondary infection, is unquestionably advisable following nephrectomy. It is our experience at the Mayo Clinic that the caseating kidney offers a much better prognosis and much less mortality than miliary tuberculosis. In miliary tuberculosis scattered over the surface of the kidney the mortality is almost twice as high as it is when caseation is present.

Dr. Benjamin S. Barringer, New York: It is essential not to operate on the kidney without the previous use of the cystoscope. The fact that one often sees enormous vessels of the kidney and comparatively infrequently notices hydronephrosis shows there is something wrong with the anomalous vessel theory.

Dr. Ernest Watson, Buffalo: The pyelogram is the only measure we can rely on with any certainty in making an absolute diagnosis in these cases, particularly if they do not show evidence of infection. Oftentimes a dilated ureter and dilated kidney pelvis will not give evidence without examination of the ureters.

Dr. George Stark, Syracuse: I recall sixty cases of renal colic with hydronephrosis in which symptoms disappeared following dilatation. In cases of pyelitis one can bring about more cures by dilating and irrigating the pelvis of the kidney than by lavage alone.

Dr. Wolf, New York: Tuberculous kidney is operable in the early stage, and the prognosis is excellent. I recall two such cases, one of which was a case of bilateral tuberculosis which I saw two years ago. The other was a large cystic kidney in which pressure on the right side was demonstrated, and the cystoscope showed a purulent secretion. I removed the kidney in the case of bilateral tuberculosis, and two years after the operation the girl was healthy. Cystitis is an early and a late symptom. It is the last symptom to disappear in tuberculosis of the urinary tract.

Dr. Joseph F. Shears, New York: Stricture of the ureter is more common than most practitioners admit and is probably a cause of hydronephrosis.

Trench Fever

Major Alexander Lambert, New York: Commissioner Murphy early last summer informed me that it was his desire I should build up as good and scientific an organization as it was possible to do. He formed a research committee. He obtained an appropriation of $100,000 and said we could use as much of this amount as in our judgment seemed best, without restrictions, and asked us to decide on what was best to be done. He obtained the cooperation of the Medical Corps of the British Army and of the French Army, and the three Medical Corps met every month as a research medical society. They have given to the American, British and French surgeons their best experience and ideas, and have placed our men in a position to go on with research work in medicine and surgery in 1918. Otherwise we should have had to work out and struggle over the same problems that the French and British have done before. This cooperation has been of the greatest help, and is one of the best things we could have done to solidify the Medical Corps and give aid to the army and surgeons that need it.

As to trench fever, its transmission and origin have been solved. Trench fever is a curious break-bone fever that has a sharp, shooting temperature. The temperature rises to 103 and 104 F., with aches of an intense character in the insertion of the muscles, and then it drops. Again, it rises for four or five days and takes on the character of a regular recurring fever. It cannot be told, except by blood cultures, from the recurrent infectious fever of Weil. No organism has been found for it. You cannot transmit it to any animal. We experimented with everything up to monkeys and were unable to produce the fever. We realized that we must ask for volunteers, and a curious thing is that some of the men who worked with General Gorgas in Cuba in connection with yellow fever and were volunteers there were with us. Colonel Ireland, who was on the research committee, worked out the line of research in conjunction with General Wood, and Colonel McCoy was chief of staff. Colonel Ireland took the necessary orders, asked for volunteers, and of the 500 men who offered to go, sixty were accepted, and within six weeks from that time, through experimental work, it was found that trench fever was transmitted by the bites of body lice. They worked with the body lice in the trenches and worked with the lice they secured from London. Trench fever was the cause of 10 per cent. of the English army in the last year being on the sick list when these men ought to have been in the trenches. No man dies of the fever, but it disables him for two or three months. This discovery has solved the question, and it saves from 8 to 10 per cent. of the active force. This the Red Cross has succeeded in doing.

1. Methods Used for Undernourished Children.—During the past few years attention has been repeatedly called to the fact that a large number of children in this country are undernourished. Nov. 1, 1916, a nutrition class was started in the outpatient department of Bellevue Hospital as an experiment to determine how much could be done to improve the nutrition of undernourished children when handled in large numbers. The methods used in this class have been worked out in the children's tuberculosis class and other classes at the Vanderbilt Clinic. The general plan which has been kept in mind has been to make a careful diagnosis, to correct remediable physical defects, to determine and correct any economic factors that have a bearing on the case, and to try to improve the hygiene and diet of the child by every possible means. A printed slip with directions as to the general care of the child and a diet list are given to every mother. At the first visit the attention of the mother and child is called to the food exhibit, as an aid to impressing on their minds the elements of a proper diet. The visual impression made on the mother and child adds tremendously to the significance of the printed list of goods given out on the diet list. Class talks are given frequently to groups of mothers. Mothers are urged to return once a week. In extreme cases, especially when there is marked anorexia, a complete rest cure is given. Weight charts are used for every child. A photograph is taken of every child in the class, and is pasted on the back of the weight chart. Home record sheets are used for the purpose of having the child or mother record what happens to the child each day. An analysis of 110 cases has been made to determine the results of the class experiment. It has been possible to make 57 per cent. of the children gain at 1.7 times the average rate for their ages, and 22 per cent. at about the average rate, or a total of 79 per cent. who have gained at or better than the average rate. Of the remaining 21 per cent., there is one or more easily ascertained reasons for the failure in every case. These results have been obtained under the most adverse circumstances. The problem of infant mortality has been solved in large part by means of classes for teaching mothers the care and feeding of infants.

6. Sensitized Vaccines in Infections.—Cecil employed sensitized vaccines in a series of forty-seven cases, which include twenty cases of prophylactic vaccination against typhoid and twenty-seven cases of therapeutic vaccination against gonococcus, streptococcus, *Staphylococcus aureus* and tuberculous infections. The sensitized typhoid vaccine produces a somewhat milder reaction than ordinary typhoid vaccine, and probably gives just as high an immunity. At the present time, however, the evidence for its superiority is not sufficient to justify the substitution of sensitized for ordinary vaccine in practice. In the various infections treated with sensitized vaccines the results were, as a rule, no better than would have been expected with ordinary vaccine. It happened that in a few instances recovery followed the administration of sensitized vaccine after treatment with ordinary vaccine had failed. This may have been due to the fact that larger doses could be employed without untoward symptoms. The chief objection to the general use of sensitized vaccines is the increased labor and time necessary for their preparation. At the present time it would seem desirable to limit their use to the treatment of infections in which there is hypersensitiveness to ordinary vaccines or in which the latter have proved inefficacious.

8. Effects of Antacid Medication on Gastric Secretion.—Crohn believes that the use of fractional doses of the alkalis distributed over the course of digestion is the most efficient and physiologic method for the employment of these agencies; for this purpose magnesium oxid is the most dependable and best suited salt. Based on these studies it seems very questionable whether prolonged use of the alkalies leads to any permanent diminution of the acid secretion of the stomach; in fact, it is as likely that the opposite effect is produced. A lasting relief of hyperacidity is not to be sought in antacid medication, nor in olive oil or atropin. It is more likely to be found in the proper regulation of diet and restriction of dietary errors as well as in the general control of the hygiene and manner of living of each individual patient under professional care.

10. Vaccine for Bronchial Asthma.—Certain observations of the writers, derived from the study of a considerable number of cases of asthma, have strongly suggested the possibility of the presence of the specific protein in the bronchial secretions of the patient himself, and also that this protein may be recovered in suitable form for use in bringing about immunity. The vaccine the authors use is made in the following manner: 1 c.c. of washed sputum is incubated in 10 c.c. of broth and 1 or 2 drops of guinea-pig serum for a period of forty-eight hours. At the expiration of that time the culture is standardized and killed by heat of 60 C. for a period of two hours. Further decomposition is prevented by adding phenol until a 1 per cent. solution results. This is cultured out to insure sterility of suspension. The vaccine is then diluted with normal saline until each cubic centimeter of the suspension contains 500,000,000 to 1,000,000,000 organisms. The initial dose is 5 minims and each subsequent dose is increased by 1 minim. The authors do not increase beyond 15 minims, although they may continue the treatment several weeks after this amount has been reached.

The effect of this plan of treatment has been observed in twenty cases of typical bronchial asthma. In twelve of these cases complete relief from attacks was experienced after from one to five injections of the vaccine and this relief has persisted up to the present time. The longest period of freedom from symptoms is sixteen months, the shortest six weeks. In five cases distinct improvement has been noted either in the frequency of the seizures, their severity, or their duration. In three of these cases improvement occurred only after a second vaccine had been made and administered at shorter intervals than the first. In two cases no effect at all was produced. One of these patients was an elderly man with emphysematous lungs and a history of asthma extending over twenty years. Asthma in the other case had followed injury to the chest and roentgen-ray examination revealed ununited fractures of several ribs. In one case administration of the vaccine seemed to increase the intensity of the paroxysms, a result which appeared to be explained by the fact that too long a time was allowed to elapse between injections.

11. **Atmospheric Air in Upper Digestive Tract.**—The results of his study have convinced Kantor that in general, gaseous accumulations in the upper digestive tract have atmospheric air as their basis. This air is introduced by ordinary swallowing or by an adaptation of the swallowing mechanism known as gulping. The differences between the swallowing of air and that of food depend to a large extent on the influence of gravity. As a result the swallowing mechanism shows certain peculiarities which are described in this paper. By means of fluoroscopic observations it can be demonstrated that the so-called swallowing sounds are produced by the entry of air into the stomach. A close study of the mechanism of deglutition based on a review of the literature and on original roentgen-ray observations shows the advantage of describing the complete act of swallowing as consisting of three instead of the classic two periods. These three periods are the buccopharyngeal, the esophageal and the cardiogastric.

13. **Graduated Work in Cardiac Insufficiency.**—Barringer claims that the occurrence of a delayed rise in systolic blood pressure after work indicates that the preceding work has either overtaxed or is on the point of overtaxing the heart's reserve power. The presence of a delayed rise can be determined by the infrequent method of plotting the pressure curve with almost as much certainty as by the frequent method. Experiments on normal people and on patients with cardiac insufficiency showed that no definite relation existed between the time required for the pulse rate to return to normal and the condition of the cardiac reserve power.

22. **Clinical Study of Bronchial Asthma.**—One hundred and fifty cases of asthma were studied by Rackemann. The object of study was threefold: 1. To discover the cause of asthma or to identify the offending foreign protein in each patient. 2. To separate the patients having the same cause of asthma into groups. 3. To see whether there was one or more symptom or sign present in each patient and not present in normal nonasthmatic persons which might indicate a fundamental disturbance of anatomy or physiology in these patients as a group.

Each patient was studied by taking a very careful history, by making a complete physical examination, including chest, roentgenograms, special examination of the nose and throat by experts, electrocardiogram, and blood smears when necessary. In addition, skin tests, were made in a large proportion of the patients. Water-clear, sterile solutions of various protein substances were diluted so that each contained the same quantity of total nitrogen per cubic centimeter. These solutions were then injected intradermally. In normal nonasthmatic persons and in certain asthmatics, there was no result showing that the solutions were not irritating. Certain asthmatics gave positive tests. These consisted of a typical urticarial wheal surrounded by a zone of bright erythema, which appeared within ten minutes and was evident for perhaps forty-five minutes or even longer. From the history and skin tests, it has been possible to group 80 per cent. of the patients.

Twenty-eight per cent. of the cases had extrinsic asthma, while almost twice the number, or 53 per cent., had intrinsic asthma. Of the extrinsic cases twenty-four gave a definite history of aggravation of asthma during the summer months, and all but five gave a positive skin test to extracts of one or more pollens. In about half of all these cases the asthma ceases abruptly with the first frost. Sixteen cases gave a positive skin test to horse dander protein and gave histories at least compatible with, and often too obvious of, susceptibility to horses. Twenty-one other patients gave a positive skin test to horse dander protein but are not classed as horse asthmatics because there is nothing in their history or in their daily life which made it seem reasonable or even possible that horse dust or horse "emanation" might cause their asthma. Only two cases in this particular series gave a history of violent susceptibility to food.

Of the intrinsic cases in five derangement of the gastro-intestinal tract seemed to be a possible cause. In twenty-four cases the attacks of asthma came on only after a "cold" and recurred only at relatively long intervals. Winter asthma and chronic bronchitis are included in thirty cases of emphysema. Tuberculosis was found in six cases. Ten cases were associated with pregnancy (2), with catamenia (2), with enlarged bronchial lymph nodes (3), with lordosis (1), with obscure circulatory disturbances (2). One hundred and eighty-four differential blood smears made in 123 cases have shown a relatively constant eosinophilia averaging about 5 per cent., but there has appeared no significant difference between the eosinophilia in cases of extrinsic from that in cases of intrinsic asthma, nor any significant difference in the counts made during and between the asthmatic attacks in either divisions.

29. **Punctiform Keratodermia.**—Matsumoto reports a peculiar type of punctiform keratodermia existing on the palms occurring in a girl, aged 19. On the palmar surface of the hands and fingers, strictly confined to the flexures of the joints, there were numerous miliary, horny, punctiform efflorescences, yellowish or light brownish in hue, from pinpoint to poppy seed in size. The primary lesions were minute, slightly elevated, at times scarcely visible papules, oval or roundish in shape, showing a slight degree of hyperkeratosis. They usually appeared isolated, but some coalesced to form irregularly shaped eruptions and often showed slight desquamation in the center, so that some were slightly cupped at the summit. But a comedolike horny plug or central conical plug was never seen. The palms showed no hyperidrosis. Diffuse keratosis was not present. No dilated sweat orifices were noticed; neither was an excentric growth of the lesion demonstrable. The distribution and arrangement of the lesions was quite peculiar and exhibited on both hands a well marked symmetry. The soles were intact. The eruption appeared early in her childhood (before she was 5 years of age), but the patient was unable to give the exact date of its outbreak and course, as there was no subjective symptom. The disease ran an extremely slow course, was beyond doubt. No hereditary taint was ascertainable. The patient was afflicted,

furthermore, with so-called tuberculids on the ears, and the extensor surfaces of the elbows and knees.

31. **Estimating Value of Wassermann Reaction.**—Stillians claims that the use of a mixture of glycerinized strong positive serums, titrated with each set of Wassermann tests as a positive control, gives an accurate idea of the strength of the Wassermann reaction. Titration of complement against the combination of antigen with a fraction of the titer of this positive control gives valuable information as to the combining power of complement in the syphilitic system. By the use of this method of titration, variations in strength of the Wassermann reaction can be minimized. Old complement is apt to lose its power to combine in the syphilitic system before its hemolytic value fails. Such variations are detected and estimated by the new method of titration.

35 *Effects of Thorium and Other Substances on Renal Parenchyma when Retained. J. E. Burns and P. B. Hopkins, Baltimore.—p. 145.

33. **Urinary Antisepsis.**—The ideal internal urinary antiseptic must be a drug which is chemically stable, nontoxic and nonirritating to the urinary tract; which is antiseptic in high dilution in urine, regardless of the reaction of the latter; and which is eliminated unchanged in high percentage by the kidney. Davis and White claim that there is no such drug known. A consideration of the properties possessed by phenolsulphonephthalein, however, shows that this compound comes very close to filling all above requirements. The property possessed by phenolsulphonephthalein, by virtue of which is it so rapidly eliminated by the kidney, is by no means limited to this compound. Several other more or less closely related compounds show the same striking "renal affinity," and might also be of value in testing renal function were it not that phenolsulphonephthalein itself is so nearly ideal for this purpose. Compounds of the xanthone class, that is, phthaleins (though not necessarily sulphonephthaleins) in which there is an oxygen atom linking the two phenol groups, show a similar remarkable "renal affinity." The bromination of these compounds, both sulphonephthaleins and xanthones, almost completely prevents the excretion, but chlorination merely diminishes the excretion. Iodination prevents excretion or gives rise to elimination of the substance in a modified form. It has been possible to establish a certain relationship between chemical structure and renal excretion, and to predict, with a reasonable amount of accuracy, which drugs will and which will not be excreted. The synthesis of germicidal compounds, very closely related to the types excreted, has been accomplished; one of these compounds, rhodamin, was excreted and would have been satisfactory but for the interfering action of the urine; another compound "mercury fluorescein," has been found to be rapidly excreted and to produce germicidal urine. The authors hope that their experiments may call attention to the inadequacy of the urinary antiseptics in general use, and stimulate interest in the possibilities offered by synthetic chemistry. The investigation in being continued and the properties of various related compounds are being studied.

35. **Effects of Thorium on Renal Parenchyma.**—Burns and Hopkins found that thorium solution retained in the renal pelvis has no damaging effect whatsoever on the renal parenchyma. Cortical abscesses and pyelitis are due to the presence of infection and not to the retained solution. The cortical changes after the introduction of thorium solution are purely pressure phenomena and are the same as after either simple ligation of the ureter or the introduction of sterile water or normal salt solution into the renal pelvis. Collargol retained in the renal pelvis causes not only great damage to the kidney itself but systemic poisoning most often resulting in death. Ligation of the ureter either alone or after the injection of some solution causes hydronephrosis. The size of the hydronephrosis depends entirely on the development of the compensatory collateral capsular circulation.

58. **Myxosarcoma of Temporal Bone.**—Three years ago Elsberg's patient developed a large swelling in the left submaxillary region. A mass of glands were removed which was said to have been of a chronic inflammatory nature. After the operation she noticed that the left angle of her mouth "drooped" more than it had ever done before. She recovered satisfactorily from the operation and did not have any new symptoms until September, 1916. About one and a half years prior to making this report, after a severe mental shock, the patient began to have frequently headaches and attacks of dizziness. The headaches recurred very frequently and were uninfluenced by treatment. On the basis of the symptoms present at this time the diagnosis of a tumor in the left cerebellopontine angle was made, and the patient was operated on. The dura over the cerebellum was exposed by a typical bilateral suboccipital craniotomy. As soon as the dura covering the lower part of the left hemisphere was exposed by the removal of the occipital bone, considerable yellow gelatinous material began to extrude from the left posterior fossa, and after the dura had been depressed, the left posterior fossa was found to be entirely filled by this material. Considerable of the gelatinous matter was removed with a spoon. There was some bleeding from the jelly-like substance, and it was evident that the entire side of the fossa

was filled up by the mass. The wound was closed in the usual manner. The pathologist reported that the tumor was a myxosarcoma.

Aside from the rarity of this form of tumor in this location, the symptoms and clinical signs presented by the patient were of extraordinary interest and most confusing. In each attack of illness the left side of the body, and especially cranial nerves on the left side, were affected. An attack of smallpox followed by otitis, left behind a paralysis and atrophy of the left side of the tongue and diminished hearing of the left ear. A postpartum attack—probably one of cerebral embolism—added a paresis of the left side of the face and a weakness of the left arm with paralysis of the left cord. After the removal of glands from the left side of the neck, a branch of the left facial nerve was found to be completely paralyzed (ramus marginalis mandibulae). Finally, the patient developed symptoms which were clearly referable to the left lobe of the cerebellum and the left posterior fossa—ataxia, nystagmus, adiadochokinesis, hypesthesia over the distribution of the left trigeminus, complete paralysis of the left facial, complete nerve deafness in the left ear and loss of the normal caloric reactions on that side.

5 *Sterilization of Skin and Other Surfaces by Mixture of Crystal Violet and Brilliant Green. V. Bonney and C. H. Browning.—p. 562.

1. **Intravenous Injection in Wound Shock.**—The general practical conclusion to be drawn from Bayliss' lecture is that the main factor in the successful treatment of wound shock is to ensure an adequate supply of blood—that is, of oxygen—to vital organs, especially to the nerve centers. This is most simply done by intravenous injection of gum solution, which does not appear to be, in most cases, inferior to blood. When very great hemorrhage has occurred, it would seem reasonable that blood transfusion should be preferred. A solution of gum arabic of 6 per cent. strength has been found, both in the case of wounded men and in lower animals, to maintain blood pressure indefinitely. It does not leave the blood vessels. Gum is quite innocuous, even in a volume equal to one half of the total blood volume, or an injection of more than a liter and a half in man. It produces no hemolysis or agglutination in man and does not increase the viscosity of the blood. Since it contains no protein, anaphylaxis in case of a later injection would not be expected, and, tested on guinea-pigs, was found not to occur. Gum is chemically a very inert substance and is not foreign to animal metabolism. It consists of derivatives of galactose and of arabinose. Galatose is a natural sugar present in milk. Arabinose appears in the urine in pentosuria and appears to arise from galactose by removal of carbon dioxid (Neuberg). Since commercial products contain small amounts of calcium and potassium salts, there is no need to add them. All that is necessary is the addition of 0.9 per cent. of sodium chlorid, and tap water may be used. The solution must be filtered through flannel or other convenient medium and then sterilized. A strength of 6 per cent. is probably the best for routine use. In practice, even 3 per cent. has been found greatly superior to saline solutions, but it is clear that its osmotic pressure is not the optimal one.

If the use of sodium bicarbonate is thought necessary, it is best given by stomach or rectum. But it has not yet been demonstrated that the symptoms relieved by bicarbonate would not be more effectively cured by raising the blood pressure. In principle it would seem to be a mistake to reduce the slight increase of acidity in the blood, since this is of value in stimulating the respiratory center, and there is no evidence that the slight increase of hydrogen ion concentration which is present in some cases of acidosis, but not always, is in any degree harmful in itself.

5. **Sterilization of Skin With Crystal Violet and Brilliant Green.**—The method which Bonney and Browning have employed as a routine for the last two and a half years, is as follows: The solution contains 1 per cent. of a mixture of equal parts of crystal violet and brilliant green dissolved in equal parts of alcohol and water. (The powder is dissolved in the undiluted spirit first of all and the water then added.) Six hours before the operation (except in certain cases) the solution is painted over the skin of the operation area; a compress of lint soaked in the same and covered by a sheet of waterproof batiste is then applied and kept in position by a binder or bandage. This compress is removed on the operating table and no further painting done. The result is that the skin is stained an intense violet black; the staining remains unchanged throughout the operation and, indeed, for a week or two afterward. This prolonged application of the antiseptic produces no irritation of the skin, or of more sensitive surfaces such as the vulva and vagina. The theoretical advantages of an antiseptic capable of being applied in such concentration and over such a period are obvious. The epithelial squames throughout the entire thickness of this layer become permeated with the dyes. Should a squame become detached and conveyed into the wound it carries with it a definite amount of a potent but practically nonirritating antiseptic, and the skin surface exposed is not merely initially sterilized, but remains antiseptic throughout the operation. The clinical results accord with the theoretical. The very marked superiority of violet green over the commonly used iodin was strikingly demonstrated in bacteriologic experiments.

12 Bladder Drainage and Irrigation. J. MacMunn.—p. 672.
13 *Fistula in Ano. F. S. Edwards.—p. 673.

9. **Tachycardia.**—A large number of cases belonging to the enteric group of fevers examined by Marris were characterized during the febrile period by a relatively slow heart rate; some developed tachycardia gradually during convalescence, a few abruptly, while the minority were conspicuous by the presence of rapid heart action throughout the disease. The cardiovascular system was repeatedly examined. In some cases the tachycardia was cardiac in origin; in some

toxic in origin. In a third group it was a vasomotor tachycardia and in a fourth group it was a postural or atonic variety of tachycardia. In a series of 650 cases of the enteric group of fevers tachycardia of sufficient degree to attract attention was observed in 75 cases; 5 of these were judged to be cardiac in origin, 40 were due to vasomotor instability, 10 were of the postural variety, and the remainder presented features suggestive of Groups 2 and 3. During the course of this investigation similar observations were carried out on the cases of tachycardia occurring in other febrile disorders. In the fatal cases, such as diphtheria, cerebrospinal meningitis, miliary tuberculosis, scarlet fever, the tachycardia was found to be of the cardiac variety. The majority of the nonfatal cases belonged to the vasomotor group and occurred during the convalescence of such diseases as diphtheria, scarlet fever, trench fever, influenza and pyrexias of obscure origin. A few of the postural variety were encountered in obscure febrile disorders with gastro-intestinal signs and symptoms.

13. **Fistula in Ano.**—In Edwards' opinion the failures are due to one of three reasons. First and foremost, the topography of the fistula is not thoroughly recognized and thus a part of the fistula's track escapes division. Second, caries of the coccyx, or even of the ischium, is a not infrequent cause of a persisting fistula, and unless this is discovered and dealt with a cure is impossible. Third, tubercle; but although a certain small proportion of fistulas are tuberculous, it is astonishing how readily healing takes place after operation in the majority. When it does not the operation wound remains open and gaping, but the fistula as such may no longer exist.

25 *Functional Heart Disturbances in Soldiers. A. Clerc and P. Aimé.—p. 290.
26 *Epididymitis with Meningitis and Influenza. Beaussart.—p. 294.

21. **Black Pleurisy.**—The case reported teaches that the discovery of black blood in the pleura means an old hemothorax and that infection is probably already installed.

22. **Walled-Off Meningitis.**—Necropsy showed that the ventricles were intact, which explained the negative results of puncture trephining of the ventricles in the case of meningitis in a man of 42. The spinal cavity had evidently become partitioned off from the skull cavities, but this partitioning was much lower down. In future, before puncturing the ventricle, Leroy intends to puncture the spinal cavity in the thoracic or neck region.

24. **Valvular Disease and Active Service.**—Lafosse reviewing his experience with forty-seven cases of valvular disease in soldiers, comments on the surprising tolerance of the men with valvular disease. Thirty-nine of them are doing excellent work in the way of limited service; only 8 have been invalided. Josué stated that he has examined 2,419 men with valvular disease. He restricts to the auxiliary or limited service those who have never had any disturbance from their well compensated valvular trouble. With slight transient disturbance after physical effort, he advises the auxiliary service in the same way except that he specifies that the man must be kept under medical supervision and must not do heavy work. With a tendency to dyspnea, fatigue, etc., which will probably yield to repose and treatment, the man should be temporarily invalided. With any disurbances more than the above, discharge from the army is imperative. Laubry said that in passing judgment on valvular disease—other things being equal—the age over 35, recurring infectious diseases, narrow chest, dilatation of the heart, or persisting anomalies in the arterial pressure turned the scale in favor of permanent invaliding of the men. He does not pay much heed to functional tests. His early zeal in saving men with valvular disease for limited service has been gradually dampened by the unfavorable issue in certain cases, as the exigencies even of the limited service impose a strain at times on the men, and the specialist cannot follow them about.

25. **Functional Heart Disturbances.**—Clerc and Aimé remark that a serious obstacle to the recovery of men with functional heart disturbances is often found in the men's conviction that they have organic heart disease; possibly they have been so informed by some physician. In 88 of these purely functional cases, the label had been mitral insufficiency (13); endocarditis (8); myocarditis (4), or aortic lesions (2), besides a number called merely "heart disease," but Clerc and Aimé were unable to detect any organic lesion. These divergencies are due, they say, to the exaggerated importance ascribed by some to a few fleeting extrasystoles or respiratory arrhythmia, or misinterpretation of the inorganic murmurs which were found in 58 per cent. of the men. They reiterate that a murmur, the organic character of which is not evident, does not, in itself alone, testify to a valvular lesion. In deciding whether the man is fit for duty, they lay great stress on the general state of the strength, as the strength of the heart is often only the reflection of this. They stress further the response to repose.

26. **Orchi-Epididymitis with Meningitis and Influenza.**—Beaussart has noticed that infectious diseases later are liable to cause meningeal reactions when the person has passed through meningitis at any time. In a case described, bilateral orchi-epididymitis developed in the course of meningitis and again, a year later, in the course of influenza with severe meningitic symptoms.

Journal de Chirurgie, Paris

May, 1918, **14**, No. 4

27 *Trench Foot. V. Raymond and J. Parisot.—p. 329.
28 Puncture of Brain after War Wounds. C. Villandre.—p. 364.

27. **Trench Foot.**—Raymond and Parisot have found several varieties of fungus in the local lesions, blood and organs with trench foot, and they have been able to reproduce with them similar lesions in animals. Some induce, alone, similar lesions; others require the predisposing influence of wet and cold. Trench foot therefore is the result of infection of the organism by mycelian molds in the soil, which become parasites and acquire pathogenic properties under the influence of stagnation in cold water. Treatment based on this assumption has cured 99.6 per cent. of the men without loss of tissue. In prophylaxis, the main thing is to keep the feet dry; when this is not possible, to soap them well with a medicated soap—100 gm. sodium borate and 25 gm. pulverized camphor in 1,000 gm. soft potash soap. The feet and shoes are dusted with talcum containing 2.5 per cent. camphor. Greasing with grease containing 2.5 per cent. camphor may also be useful, but the main reliance is on the soaping, repeated as often as possible when conditions invite trench foot. Among the 2,861 cases in one ambulance, only 5 per cent. of the 1,098 blacks and 5 per cent. of the 242 Arabs suffered any loss of tissue, and only 0.04 per cent. of the 1,521 French soldiers. The article is accompanied with 28 illustrations or case charts.

Presse Médicale, Paris

May 2, 1918, **26**, No. 25

29 *Primary Suture of War Wounds. G. Gross.—p. 225.
30 *Chronic Enteritis and Coprology. R. Goiffon.—p. 227.
31 Treatment of Furunculosis with Lappa. R. Burnier.—p. 229.

29. **Primary Suture of War Wounds.**—Gross' ambulance cares only for the more severely wounded, and since the system of primary suture has been systematically applied, the mortality has fallen to 10 per cent. He reiterates that every war wound which does *not* contain the streptococcus should be sutured as the routine measure. The wounds with the streptococcus look differently; the man's face is thin and drawn, the pulse fast, and there is no appetite. The aspect of the ward with streptococcus cases is quite different from that in other wards. It *is indispensable*, he emphasizes, to isolate the wounded who present the streptococcus, as this is the only *infection* to be feared from the standpoint of early suture. Experience is confirming more and more that anaerobes are unable to proliferate in a living body unless they *find* devitalized tissues with one or more aerobes. With ordinary aerobes, the *process is localized*; with the staphylococcus it slowly spreads, but with the streptococcus it spreads rapidly and may assume a fulminating form. As soon as the devitalized tissue has all been excised, he sutures at once while waiting for the bacteriologic findings. If ordinary aerobes are found, he leaves the suture unmolested. With the staphylococcus, he keeps a special watch over the wound to see if slow *putrid infection* is becoming installed, cutting a thread or two at need. If the streptococcus is found, he removes the suture at once, opens up the wound anew, and by successive clearing out of devitalized tissues combats the putrid fermentation. The anaerobes do not start trouble until about the thirtieth hour, but the bacteriologic findings are available by the sixth hour. When the primary suture was not made, he sutures the second or third day with ordinary *aerobes*. *With* the staphylococcus he *waits* for its regression, from the fifth to the eighth day. With the streptococcus, he waits for the spontaneous vaccination of the organism. This occurs on an average the twenty-first day, but may be earlier. It is manifested by a drop in the temperature, but does not become definite until there is no *longer* any general reaction or the streptococcus has *entirely* disappeared. In Gross' experience 78.3 per cent. of the wounds were sutured at once, and 88.8 per cent. of the sutured wounds healed by primary intention.

30. **Chronic Enteritis.**—Goiffon insists on the importance of examination of the stools as the indispensable aid to clinical and roentgen study of every case of inflammation in the small intestine, disease of the liver and pancreas, chronic disease of the cecum, fermentation diarrhea, mucous colitis, left colitis and sigmoiditis, intestinal ulceration, and every case of colitis of parasitic origin; also for determination of the enteric origin of certain forms of gastric dyspepsia, and of the gastric origin of certain forms of enteritis, and in differentiation of factitious and of unrecognized bowel trouble. Each of these groups he defines and describes, insisting on the importance from the military standpoint of prompt diagnosis and treatment. In wartime we must cure quickly or return the man to civilian life.

Clinica Chirurgica, Milan

May, 1918, **25**, No. 5

32 *Correction of Paralytic Talipes. A. Guaccero.—p. 449.
33 *War Wounds of Bladder. G. Mioni.—p. 473.
34 War Wounds of Knee. G. Razzaboni.—p. 486.
35 War Wounds of Skull. M. Sertorio.—p. 500.
36 *Reinfusion of Extravasated Blood. R. Alessandri.—p. 504.

32. **Tendon Plastics to Correct Paralytic Talipes.**—Guaccero refers to paralytic deformity in the domain of the external popliteal nerve left by poliomyelitis. He has done a plastic operation of the kind on tendons in thirteen cases of severe equinus varus. Healing was by primary intention in all and the outcome has been extremely satisfactory in eleven of the cases. The ultimate results in the other two cases are not known. He utilizes the gastrocnemius and soleus by joining them to the tendons of the paralyzed antagonist muscles. By this means the foot is brought to some extent under muscular control and is held in an approximately normal position. He exposes and slits the Achilles tendon into three strips, shortens the dorsal flexor tendon, and draws one strip of the Achilles tendon through to the dorsum of the foot, and then reconstructs the Achilles tendon with what is left, as he explains with illustrations.

33. **War Wounds of the *Bladder*.**—Mioni relates that he has seen only five cases of wounds of the bladder amenable to treatment among the 4,500 wounded soldiers that have passed through his field hospital. The others with bladder wounds succumbed to associated wounds. He found packing the bladder with gauze useful in arresting hemorrhage.

36. **Reinfusion of Extravasated Blood.**—Alessandri quotes Kreuter's case in *which a liter* of *blood* from the ruptured liver was injected into a *vein in* the arm. Over 2 liters of blood had been *taken from* the abdominal cavity and the blood had stood outside the *organism* for a half hour before the *infusion*. The immediate results were surprisingly good, but there were other wounds which soon proved fatal. Elmendorf has also reported a *similar* case, reinjecting the blood drawn from a hemothorax, and the man recovered. Cases are on record in *which obstetricians* have successfully reinjected blood from the hemorrhage with extra-uterine pregnancy. The *blood in all these* cases seems to have been defibrinated; it did not display *any pyrogenic property*. The blood from a wound of the liver, spleen, lungs, kidneys, heart or large vessels may be *regarded as* practically sterile. Even if it does contain some *germs*, the blood itself injected with them is the most effectual *means to* combat them. Of course, perforation of the bowel *or the* presence of a foreign body, scrap of clothing, etc., would enhance the danger, and unfortunately these *conditions predominate* with war wounds. But the successes reported by Thies and Lichtenstein with tubal abortion hemorrhage have demonstrated *that* theoretic preconceptions need not render one *too timid*.

38 *Lesion of Nasal Septum in Cocain Addicts. G. Turtur.—p. 417.
39 War Wounds of Recurrent Nerve. C. Chiri.—p. 419.

37. **Peritonsillar Abscess.**—Bilancioni remarks that phlegmons *close to the tonsil* are rather frequent in soldiers, so that he has had opportunity to study quite a number of them. He *has become* convinced that the Killian, Lemaitre and Ruault technics do not answer *the purpose* of radical treatment so well as to cut out the upper half, at least, of the tonsil. This ensures complete *drainage*; the lower portion of the tonsil can be left unmolested. The anatomic conditions do not favor extension of the phlegmon downward, while the conditions around the upper part of the tonsil *invite retention* of pus. This is the cause of the frequent relapses with other technics.

38. **Nasal Lesion in Cocain Addicts.**—Turtur has found necrotic ulceration of the septum common among those who snuff cocain. It develops early, within two or three months, and often entails perforation. This is liable to be attributed to some constitutional disease if the addiction is not known, and recruits have been rejected on this account alone, the history of the cases not being brought out clearly enough to explain matters.

45 *Serotherapy for Vomiting of Pregnancy. R. F. Melgar.—p. 65.
46 Arteriosclerosis and Angina Pectoris of Alcoholic Origin. E. Odriozola.—p. 71.
47 Geographic Distribution of Leishmaniasis in America. E. Escomel. —p. 76. Continuation.

45. **Serotherapy for Uncontrollable Vomiting of Pregnancy.**—Melgar reviews the scanty literature on the treatment of the uncontrollable vomiting of pregnancy by subcutaneous injection of serum from another pregnant woman. A number of striking cases have been reported by Mayer and Linser, Fieux and others, and Melgar adds two more to the list. He injected 10 c.c. of serum from a healthy pregnant woman, near term, following with a second or third injection of 15 or 20 c.c. at two or three day intervals. One patient was a primipara of 22, the other had borne several children, and in both the vomiting had persisted rebellious to all other measures. The improvement was pronounced in a few hours. The pulse grew slower, the vomiting less severe and less frequent, and disappeared completely by the third day. Melgar cites further three cases published by Freund, Fieux and Udaeta in which normal horse serum cured a dermatitis or incoercible vomiting in a pregnant woman, but he had no success in the one case in which he used horse serum.

53 Extraneous Modifications in Syphilitic Papule, Sicilia.—p. 249.

49. **Typhus in Portugal.**—Dr. V. M. Cortezo was sent recently by the Spanish government as a member of a commission to investigate what the Portuguese authorities are doing in stamping out the epidemic of typhus at Oporto, in northwestern Portugal. The disease is not confined to the poorer classes. There was a fatal case in the hotel where the commission was lodging. Cortezo's report extols the hospital arrangements and the work of the Portuguese public health service in general, but the war and other recent circumstances have brought conditions of extreme poverty to the towns investigated. Of Oporto, Cortezo says: "There are few cities that can compare with this in respect to its receptibility for an epidemic of the kind. Poverty and pauperism, with all the evils in their train, grip the population, without food, without clothing, with detestable alimentation and without habits of cleanliness. About a third of the populace live in small, walled-in communities, promiscuously with domestic animals. These groups of dwellings without ventilation or light are called *ilhas,* probably from the Latin *insula.*" In one of these *ilhas* he saw twenty-three persons sick with typhus, without care of any kind till they were rushed to the hospital. As Portugal is small and there is much traffic throughout, the disease soon spread to other points, notwithstanding the efforts of Ricardo Jorge, chief of the public health service. Several cases have developed among the physicians and subordinates of this service, but none have proved fatal. The nurses to care for the sick are recruited from those who have recovered from the disease. The mortality was only 10 per cent. at the time of his visit, but later reports from Vigo newspapers, as cited by the *Siglo Medico,* state that on a recent Sunday there were 100 new cases and all proved fatal. There were 400 sick in the hospital when Cortezo visited it. He was impressed with the nonsusceptibility of infants; mothers nursed their babies throughout the disease and the infants did not contract it. The hospital service is supplemented by convalescents' homes, one of which, with capacity for 200 patients, is in an outlying suburb. The commission emphasizes the necessity for a sanitary convention between Portugal and Spain as there is constant intercourse between the two countries, many workmen crossing the international bridge to their daily work.

50. **Trauma of the Eye.**—Wieden discusses what the practitioner should and should not do when called in case of trauma of the eye. In the majority of cases in rural districts of loss of vision from a simple erosion of the cornea or slight penetration of a scrap of dirt or stone or vegetable fiber, vision might have been saved if it had not been for infection of the lacrimal passages prior to the accident. The warmth, moisture and darkness enhance the virulence of germs in the obstructed lacrimal duct and in the lacrimal gland, and infection soon spreads to one or both eyes. On compressing the region of the lacrimal duct, a mucous or purulent fluid may exude from the lacrimal point or the sac forms a small tumor, like a cyst, the relaxed walls having lost their elasticity. Injection into the lacrimal point of physiologic salt solution, colored with methylene blue, or instillation of a 5 per cent. solution of a silver preparation will show whether the lacrimal duct is permeable, after the nostrils have been plugged with cotton, the head bent forward. The upper surface of the cotton will show the stain.

Wieden reiterates impressively the importance of every affection of the lacrimal passages as liable to doom to blindness in case of casual and otherwise harmless injury of the eye. Physicians everywhere should be on the lookout for lacrimal trouble, and educate the public in the peculiar dangers of even slight injuries of the eyes with infection installed in the lacrimal sac. When the lacrimal duct is freely permeable, the physician can soothe the pain by instillation of a few drops of a 2 per cent. solution of cocain, having the eye kept closed for a few minutes, then rinsing freely with physiologic saline or a weak antiseptic to clear out all foreign particles, concluding by applying petrolatum with a little boric acid and methylene blue. This lubricates and isolates the eye, and a dressing is then applied. The treatment after this belongs to the specialist. When the lacrimal duct was found obstructed, he always obtained good results from instillation of a few drops of optochin, as this has a specific action on the pneumococcus, the microbe usually responsible for lacrimal infection. When this drug is not available, he instills a 0.5 per cent. solution of zinc sulphate, and applies medicated petrolatum, but refrains on principle from bandaging the eye, as the secretions should have free outlet. He recalls to the practitioner that a magnifying glass is very useful in examining the eye for foreign particles.

Nederlandsch Tijdschrift voor Geneeskunde, Amsterdam

April 6, 1918, 1, No. 14

54 Electrocardiogram Varies with Speed of Impulse. S. de Boer. —p. 928.
55 *Convalescence Eosinophilia. D. Klinkert.—p. 941.
56 History of Medicine in the Netherlands. D. Schoute.—p. 945.
57 *Urticaria from Muscular Exertion. G. A. Prins.—p. 952.

55. **Nature of Anaphylaxis and Convalescence Eosinophilia.**—Klinkert remarks that the eosinophil count seems to run the same course in all infectious diseases. The eosinophils grow less in numbers as the disease progresses, until the acme has been reached and passed. Then they increase in numbers until the eosinophil count is above normal, and this post-crisis eosinophilia persists for some time after convalescence. He recalls that local eosinophilia accompanies the secretion of digestive ferments, and this suggests a connection between the normal digestion of food and the parenteral digestion of the invading bacteria. Convalescence eosinophilia may thus be regarded as an index of the secretion of ferments destined to digest the bacteria. The secretion of the gastro-intestinal digestive ferments is under the control of the autonomic nervous system, and the secretion of the ferments to digest the bacteria is likewise under the control of this nervous system. This plausible assumption is confirmed by the phenomena of anaphylactic shock. This shock is not the result of the circulation of the toxic split products of the albumin antigen, but these products circulating in the blood irritate the autonomic nervous system. This irritation is gradual and remains latent until the sudden introduction of a new unit of antigen upsets the precarious balance, and the anaphylaxis phenomena develop. Anaphy-

laxis is a cumulative toxic action from antigen. On account of the suddenness of the nervous discharge, the ferments are unable to aid efficiently in time. The anaphylactic shock may be defined as the baneful *artificial* caricature of the normal crisis. The eosinophilia in both is the index of the irritated condition of the autonomic nervous system. Postfebrile bradycardia may also be regarded as a phenomenon on the part of this nervous system.

Further testimony in this line is offered by recent research (Hirschstein, 1917) which has apparently demonstrated that when gastric juice and intestinal juice are formed under the influence of the vagus nervous system, a large amount of uric acid is formed at the same time. There is probably a similar formation of uric acid when specific immunity ferments are secreted under the influence of the autonomic nervous system. The urine in pneumonia on the day of the crisis contains an abnormally large proportion of uric acid. This has hitherto been ascribed to the destruction of leukocytes during resorption of the pneumonic exudate. But Klinkert thinks that this increased uric acid content is connected with the secretion of the specific antibodies. It is observed with other infectious diseases as well, at the turn for the better. In a case of typhoid, for example, the uric acid content of the urine jumped from 0.790 to 1.031 gm. at defervescence; in a case of pneumonia, from 0.815 to 1.495 gm. This increased uric acid content and the eosinophilia are thus, each of them, a phenomenon indicating the onset of convalescence. There is no retention of uric acid during fever; in fact, fever and hyperuricacidemia exclude each other. But as the temperature drops, uric acid accumulates in the blood, and is thrown off in the urine. In conclusion he reiterates the close analogy between the normal food-digestion process, with its secretion of digestive ferments, accompanied by eosinophilia and formation of uric acid, and the immunization process, with its specific secretion of ferments, its convalescence eosinophilia, and the uric acid output at the crisis. The participation of the autonomic nervous system in both processes sustains the assumption that gout can be regarded likewise as a neurosis of this system. This assumption is given a solid basis by the development of true gout in joints during convalescence from pneumonia and other infectious diseases.

57. **Urticaria After Muscular Exercise.**—Prins' patient is a girl of 15 who develops typical itching urticaria regularly after a dancing lesson and also after running or other muscular exercise. Dermographism is pronounced, as also a tendency to orthostatic albuminuria. No cause for the urticaria can be discovered unless it can be ascribed to toxic action from poisons generated in the muscles during muscular exercise. He ordered complete abstention from dancing and other exercise, and gave phosphorus and cod liver oil or calcium and tonics. The tendency to urticaria was thus broken up, and after the end of six months the restrictions were removed, without return of the urticaria, except one mild attack after hard running one hot day. He has since encountered a second case. This is in a physician and an emotional factor, besides the muscular effort, is evident in this case.

58 *The Vitamins. E. Madsen.—p. 613.

April 25, 1918, **80**, No. 17

59 Indications for Colloidal Silver. H. I. Bing.—p. 653.
60 *Case of Anaphylaxis. Kjelgaard.—p. 657.
61 *Duplicate Cases. O. Hamburger.—p. 658.

58. **The Vitamins.**—Among the practical points emphasized by Madsen is that a lactating woman must have food rich in vitamins. The lack of them may be responsible for certain pregnancy disturbances, uncontrollable vomiting, distaste for food, etc. As rachitis develops predominantly in the artificially fed, the lack of vitamins in the cow's milk or their destruction by boiling the milk, seems a plausible factor in rachitis. We do not know yet whether the scarlet fever virus, for example, survives moderate pasteurization. If the milk has to be sterilized during an epidemic, provision should always be made for supplying vitamins in some other form, meat juice for young infants; potato purée, or egg yolk for older children. In digestive troubles we must beware of not letting the diet get too poor in vitamins, as a diet that makes little demands on the digestive organs is generally poor in vitamins. Desiccation also destroys vitamins in fruit, vegetables, etc. This explains why an antidiarrheic diet keeps the patient so languid. The tea, rice water, etc., are peculiarly poor in vitamins, and special measures are necessary to correct this. A surplus of vitamins reduces the calory demand. Tagaki found that the men in the Japanese fleet gained in weight when the rations were modified to include more vitamins although it represented fewer calories. In the Danish prisons, when the bread ration was reduced and barley porridge given instead, the men gained in weight. Barley is richer in vitamins than rye and wheat.

Madsen warns that a lack of appetite is often the first symptom from a deficit in vitamins. He thinks there is much to suggest that a vitamin deficit is a factor in chlorosis anemia, neurasthenia, vasomotor disturbances, etc. In fevers, convalescence, etc., the necessity for an ample vitamin supply is imperative. It is possible that the mysterious benefit from cod liver oil may be due to an exceptional vitamin content. The commercial infant foods on the market are completely free from vitamins, and they must be added from some other source. In institutions where the food is cooked in large portions at a time, there is liable to be a deficit in vitamins.

There is no doubt, he adds, that beriberi occurs much more commonly in all countries than has been hitherto appreciated, but it is not recognized, as no one looks for it outside the tropics. The war edema without albuminuria may be a rudimentary form of beriberi. It is possible that this may be true also of many cases of peripheral neuritis and heart weakness. Among the peculiarly vitamin-rich foods he lists butter and cheese, egg yolk, raw meat and fresh meat juice and soup. Steamed meat and fish retain their vitamins better than when boiled. Meat extracts are free from vitamins. In grains they occur in a series with rice at the lowest and barley at the highest point; in rice the vitamin occurs only in the hull, in barley in both hull and kernel. The finer the flour is bolted, the less the proportion of vitamins in it. Legumes and potatoes are rich in vitamins, but they pass mostly into the water in which they are boiled, so this water should be used in the preparation of the food. Dried and cooked vegetables have no vitamins. Fresh fruit is rich in vitamins, and in the acid fruits they seem to be especially thermostable. It is still undecided whether wine and oil contain vitamins.

60. **Anaphylaxis.**—Kjelgaard remarks that when one has been giving diphtheria antitoxin for thirty years without the slightest by-effects or complications, an injection of antitoxin seems a very harmless intervention. But a recent experience has upset this belief in him. Seven years ago he gave himself a preventive injection after a child had coughed false membranes into his face, and recently he took another injection for the same reason, some of the membrane tissue having got into his eye. The sixth day intensely itching urticaria developed, preventing sleep, and the face, lips and throat swelled, the pulse became imperceptible, and deep breathing was impossible. There were pains in the eye as if an insect had got in the eye. As these symptoms subsided, pains and tenderness developed in joints and tendons, with fleeting contractures. The symptoms gradually wore off in the course of ten or twelve days leaving merely lassitude in the legs. The dose of antitoxin was 4,000 units; it was supposed to be four months old. The patient injected just before himself showed no symptoms from the injection except slight local urticaria.

61. **Duplicate Cases.**—Hamburger describes four pairs of unusual cases which occurred in close sequence, and the experience with the first gave the clue to successful treatment in the twin case, especially with actinomycosis. The patient in this second case seemed to have merely pneumonia except for a tender point on one rib and this swelled a little. The surgeon was rather skeptical when called on to open this small tumor, but this revealed typical actinomycosis.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, JANUARY-JUNE, 1918

The following journals have been abstracted in the Current Literature Department of THE JOURNAL during the past six months. Any of the foreign journals, except those starred, will be lent by THE JOURNAL to subscribers in the United States and to Fellows of the American Medical Association for a period not exceeding three days. Only one journal may be borrowed at a time. Requests for periodicals should be addressed to the Library of the American Medical Association and six cents in stamps should be enclosed. This covers the average expense of mailing a journal. Domestic journals can be obtained by sending the approximate amount direct to the respective publishers. Thus most of the journals indexed are accessible to the general practitioner, no matter where he may be located.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "E," Editorial; "C," Correspondence; "T," Therapeutics; "Ml," Medicolegal; "P," Propaganda for Reform; "ME," Medical Economics; "ab," abstract; the star (*) indicates an "Original Article" in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths" and "Society Proceedings" are indexed under these titles at the end of the letters "B," "D" and "S." Matter pertaining to the Association is indexed under "American Medical Association."

The name of the author follows the subject entry in brackets. The figures in parentheses refer to the paragraph in the Current Medical Literature Department, the number following to the page in THE JOURNAL.

For author index see page 2093.

A

- ABBOTT Bros. Rheumatic Remedy misbranded, 1624—P
  - Mixed Vaccines not admitted to N. N. R., 1967—P
- ABBREVIATIONS, method of writing, 721
- ABDERHALDEN REACTION: See also under names of various diseases
- ABDERHALDEN REACTION, [Amann] (78) 134, 692—E
  - present status of, [Abderhalden] (51) 638
- ABDOMEN, acute surgical conditions, heart infarction simulating, [Levine & Tranter] (7) 267
  - big, in soldiers, [Pisani] (73) 201, [Ceconi] (76) 1341
  - big, surgical treatment by new three flap operation, [MacLean] 414—ab
  - glioma of upper region of, [Thompson] 266—ab
  - in infants, [Gismondi] (60) 659
  - injury in newly born, [Hedren] (95) 1988
  - new incision for exposure of lower abdomen and pelvis, [Churchman] (22) 956
  - Ptosis of: See Splanchnoptosis
  - rubber envelop abdominal pad, [Bissell] *677
  - surgery at advanced post, [Drouin] (63) 816
  - surgery, exploratory, modification of universal incision in, [Del Valle] (138) 58
  - wounds, [Stoppato] (70) 659, [Carrera & Cano] (83) 660
  - wounds at casualty clearing station, [Charles] (2) 1335
  - wounds, penetrating, 111
  - wounds, stretcher for carrying those with, [Blondel] (43) 131
  - wounds, surgery for, [Moreno] (82) 740
- ABORTION cases, allowed use of hospital history as evidence in, 340—Ml
  - conservative treatment of, [Mosher] 1889—ab
  - criminal, repression of, [Bar] (42) 1572
  - due to superfetation, [Gustetter] *20
  - liability for damages from criminal operation, 483—Ml
  - septic, treatment of, [Ries] (109) 1191
  - teratogenous influence of attempts at, [Wilbouchewitch] (61) 577
  - treatment of, [Gammeltoft] (107) 580
- ABSCESSES: See also under names of organs and regions
- ABSCESSES, approval of claim for treating abscess after 30 days from accident, 876—Ml
  - peritonsillar, [Bilancioni] (37) 2058
- ACCIDENT, acute nephritis and other diseases as injuries by, 879—Ml
  - approval of claim for treating abscess after 30 days from, 878—Ml
- ACCOUNT, itemizing of, and application of payments, 1884—Ml
- ACETONE and acetic acid from beets, 928—ab
  - bodies, urinary, and ammonia excretion in diabetes mellitus, [Richards] (91) 1894
- ACHLORHYDRIA without cancer, [Ramond & others] (41) 198
- ACID, acetic, and acetone from beets, 928—ab
  - Acetylsalicylic: See also Aspirin
  - acetylsalicylic, 645
  - acetylsalicylic, Merck, 459
  - acetylsalicylic, or "What's in a name?" 1097—E
  - amino, in urine from debilitated infants, [Cannata] (44) 1126
  - fatty, in human blood in normal and pathologic conditions, [Csonka] (40) 1188
  - hippuric, formation, and liver, 1464—E
  - hydrochloric, in gastric juice, iodometric estimation of, [Scheltema] (111) 135
  - Intoxication: See Acidosis
  - lactic acid cultures in difficult feeding cases, [Bogert] (91) 489
  - lactic, effect on respiratory center, [Cohen] (41) 1892
  - Salicylic: See also Salicylates
  - salicylic, is it excreted as salicyluric acid? 1769—E
  - salicyluric, in salycil urines, [Hanzlik] (87) 194
  - uric, theory, 1368—ab
- ACIDEMIA in gas gangrene and in conditions which favor growth of its infective agent in blood fluids, [Wright & Fleming] (18) 889
- ACIDOSIS and nitrogen metabolism after transplantation of ureter into duodenum in dogs, [Goto] (31) 1259
  - in diphtheria, [Peters] (7) 490
  - in shock, [McEllroy] *846
  - in shock, hemorrhage and gas infection, [Cannon] *531
  - measure of, 1004—E
  - method of detecting acidosis and determining hydrogen ion concentration of cerebrospinal fluid, [McClenndon] *977
  - of nephritis, cause of death in, [Whitney] (23) 125
  - varying susceptibility of children to, [Sawyer & others] (1) 267
- ACORNS and chestnuts as sources of carbohydrate, 1158—ab
- ACRIFLAVINE, action of, [Morgan] (33) 961
  - and proflavine, in infected gunshot wounds, [Carslaw & Templeton] (45) 1895
- ACROPARESTHESIA from chilling, [Cottet] (43) 1982
- ADAMS-STOKES DISEASE: See Heart-Block
- ADDISON'S DISEASE plus exophthalmic goiter, [Ramond & François] (56) 815
- ADENECTOMY and tonsillectomy, [Iddings] (42) 1390
- ADENOIDS with pituitary feminism, [Citelli & Caliceti] (72) 1508
- ADENOMA, prostatic, instructive case with vesical calculus concealed by sessile pedunculated median lobe, [Lydston] *1297
- ADRENALIN: See Epinephrin
- ADRENALS: See Suprarenals
- ADULTERATION, scientific, 995—ab
  - with saccharin, 1972—Ml
- ADVERTISING, medical, 719—P
  - principles, lay and medical, 1558—P
- AGGLUTINATION after army triple typhoid vaccination, [Fennel] *1915
  - in blood, [Fahræus] (101) 1900
  - method of diagnosis in triple inoculated individuals, [Perry] (35) 1895
  - of human red blood corpuscles by horse serum, [Williams & Patterson] *1754
- AHLFELD method for determining maturity of fetus in utero, modification of, [Thoms] (117) 1636
- AIR, atmospheric, in upper digestive tract, [Kantor] (11) 2053
  - raid shelters and infection, 1181
  - raids and American Red Cross, 1247

section to consider reeducation of disabled soldiers, 868, 1541
Treasurer's report, 1839
war conference of secretaries of constituent state associations of, 1302, 1378, 1464
war service of, [Gorgas] 697
war session of, in Chicago, 1461—E
AMERICAN Medical Golfing Association, 1420
Pediatric Society, officers of, 1782
Poets' Ophthalmic Ambulance, 1875
Posture League, annual meeting of, 795
Proctologic Society meeting indefinitely postponed, 1390
Public Health Association meeting, 1179, 1553
Red Cross: See Red Cross, American
Society for Control of Cancer, work of 1917, 332
surgery in 1917, [Finochietto] (96) 1900
AMERICANS, honors conferred on, 1022
AMINO-ACIDURIA, association of, with Bence-Jones proteinuria, [Simon] *224
AMMONIA excretion and urinary acetone bodies in diabetes mellitus, [Richards] (91) 1894
AMMONOL and Phenalgin, 337—P
AMPUTATION cases, Canadian, 1019
functional value of stumps, [Amar] (78) 1899
spur-like formations of bone following, [Morgan] (56) 1120
stumps, infected, intermittent reunion for, [Chaput] (42) 1039
vitalization of artificial limbs, kineplasty, [Putti] (40) 1126, [Vanghetti] (53) 1984
AMYL nitrite inhalations in diagnosis of mitral stenosis, [Morison] (7) 1795
AMYOTROPHY, reflex, [Cano] (105) 1045
ANAEROBES, separating points in technic of, [Stoddard] *906
ANALGESIA: See Anesthesia
ANAMNESIS in cardiovascular disease, [Brady] *1449
ANAPHYLATOXIN and anaphylaxis, [Novy & De Kruif] (79) 1509
ANAPHYLAXIS: See also Immunity
ANAPHYLAXIS and anaphylatoxin, [Novy & De Kruif] (79) 1509
and respiratory and circulatory systems in relation to cause of death, [Petz & Jackson] (52) 1568
case of, [Kjelgaard] (60) 2060
phenomena following intraportal injections, [Falls] (83) 193
theory of anaphylactic shock, [Kritchewsky] (32) 570
with skin diseases, [Lutz] (35) 274
ANATOMY, plea for rational system of instruction in, [Mayer] 873—C
ANDERSON, Elizabeth Garrett, 333
ANDREWS' Wine of Life Root Annex Powders, 1184—P
Wine of Life Root or Female Regulator, 1184—P
ANEMIA, blood transfusion in, [Ravaut & de Kerdrel] (39) 891
blood volume in, new method for estimating total, [Lindeman] *1209, *1292
experimental, blood fat and lipoids of dog before and after production of, [Dubin] (34) 1188
experimental, elimination of iron and its distribution in liver and spleen in, [Dubin & Pearce] (34) 1259
experimental mitochondria in red blood corpuscles during, [Sappington] (28) 1891
experimental, viscosity of blood with, [Saneyoshi] (59) 277
hemolysis with, signs of, [Hannema] (95) 425
pernicious, hemosiderin granules in cells of urine an aid to diagnosis of hemochromatosis and, [Rous] 1887—ab
pernicious, plus lymphadenosis, [Frattini] (75) 1575
pernicious, results of treatment in, [Bloomfield] (20) 1633
pernicious, total blood volume in, [Lindeman] *1209, *1292
splenic, [Morris & others] (10) 191
splenic, pathologic study of, [Hartman] (142) 271
ANENCEPHALY, family prevalence in, [Thoms] *10
ANESTHESIA, chloroform, ether and nitrous oxid oxygen, in pregnancy and labor, [Davis] (88) 571
ether, care of eyes of patient during, [Miller] *83
ether-oil, by rectum, [Kholtzoff] (64) 277
general analgesia by oral administration, [Gwathmey & Karsner] *993
intratracheal anesthetic machine, [Adson & Little] *1746
local anesthetics, comparative absorbability of, from urethra, [Sollmann] (52) 1261
local anesthetics, comparative efficiency of, [Sollmann] *216, (85-87) 887
local anesthetics, reporting accidents from, [Sollmann & Hatcher] 158—C
local, benzyl alcohol as, [Macht] 1790—ab, (44) 1892
mechanism of action of anesthetics, [Burge & others] (11) 1332
morphin and ether, blood dextrose as affected by, [Ross] (49) 1978
spinal, [Meuriot & Platon] (55) 576
spinal, by lumbosacral cocainization, [Delmas] (30) 1402
spinal, experiences with, [Blanc y Fortacin] (107) 1803
ANEURYSM, abdominal aortic, with rupture into duodenum, [Marlow & Doubler] (5) 1498
aortic, findings in, with erosion of vertebrae; globules of metallic mercury in tissues, [Kolmer & Mastin] *1290
aortic, low diastolic and high pulse pressure in 3 cases of, [Stewart] (50) 2055
aortic, serial frozen sections of thorax from case of, [Fetterolf & Norris] (26) 416
arteriovenous, in war surgery, [Forgue] (63) 893
carotid, unilateral ophthalmoplegia due to, [Viets] (61) 1569
femoral, double, proximal occlusion with autoplastic fascial flap in, [Jones & Waites] (139) 58
nonoperative reduction of, [Castellano] (78) 1575
ANGINA, coronary thrombosis in relation to, [Herrick] 1030—ab
pectoris, [Calleja] (92) 497, [Ingals & Meeker] *969
pectoris, Clifford Allbutt's views of cause of, [Babcock] 1031—ab
pectoris, clinical experience with 200 cases, [Herrick & Nuzum] *67
pectoris, pathology of, [LeCount] *974
Vincent's: See Vincent's Angina
ANGIOMA, plexiform, and cavernous, treatment of, [Reder] 1889—ab
ANKLE reflex, paradoxic, as sign of organic disease, [Bing] (64) 1640
wounds of foot and, in war, [Quénu] (74) 133
ANKYLOSTOMIASIS: See Uncinariasis
ANONYCHIA, partial hereditary, [Charteris] (30) 1895
ANOSCOPE, self-retaining, [Pennington] *154
ANTHELMINTIC medication, [Hall] (123) 654
value of components of oil of chenopodium, [Hall & Hamilton] (43) 1892
ANTHRAX, 952
B. anthracis septicemia, with recovery, [Graham & Detweiler] *671
successful treatment of, [Dudley] *15
ANTHROPOLOGY, British, problems in, [Keith] 1020
permanent department of, 1964
ANTIBODIES, circulating, relation of, to serum disease, [Longcope & Rackemann] (66) 1036
extracts of, obtained from specific precipitates of typhoid antityphoid serum, [Weinstein] (46) 731
production and antigen dose, quantitative relationship between, [Tsen] (54) 810
production, effects of roentgen ray on, [Hektoen] (75) 193, (39) 486
production, influence of arsphenamin and mercury on, [Kolmer & Toyama] 1496—ab
ANTIGENS, bacterial, method of preparing, [Small] 1497-ab
dose and antibody production, quantitative relationship between, [Tsen] (54) 810
precipitin, production of, from bacteria, [Krumwiede & Noble] (44) 731
ANTIPHLOGISTINE, [Gould] 557-P
ANTIPNEUMOCOCCUS serum, 1599, 1923
serum, potency of, [Wayson & McCoy] *1747
ANTIPOLLEN serum for standardization of pollen antigen, [Clock] (46) 486
ANTISEPTICS, action of, on toxin of bacillus aerogenes capsulatus, [Taylor & Austin] (68) 1036
modern, [Gould] (4) 59
nontoxic, [Mencière] (54) 893
properties of certain organic compounds, [Kligler] (33) 1259
reagents, hemagglutinin reaction as test of toxicity of, [Bond] (2) 959
solvent action of, on necrotic tissue, [Taylor & Austin] (54) 268
toxicity of widely used, [Taylor & Austin] (70) 1794
ANTITETANUS Serum: See Tetanus
ANTITOXIN, Diphtheria: See Diphtheria Antitoxin
ANTITOXIN, production of, [Kraus & Sordelli] (77) 1406
Tetanus: See Tetanus Antitoxin
ANTITRYPSIN, clinical test of action of, and diagnostic value in cancer, [Kurata] (3) 347
ANTIVENOM serums, specific precipitating properties of, [Houssay & Negrete] (96) 819
ANTIVIVISECTIONISTS and barb wire entanglements, 168—E
another challenge to, 1948—E
misrepresentation exposed, [Keen] 1542
newspapers on Red Cross and, 238—E
ANTWERP physicians penalized by Germans, 1245
ANUS, fistula of, [Edwards] (13) 2056
fistula of, divulsion in treatment of, [Masci] (82) 1899
fistula of, medical cure of, [Peter] (122) 1271
ANUSOL Suppositories, 719—P
AORTA, abdominal, aneurysm of, with rupture into duodenum, [Marlow & Doubler] (5) 1498
abdominal, experiments outlining limitations of operations on, [Goodman] (65) 1794
aneurysm of, serial frozen sections of thorax from case of, [Fetterolf & Norris] (26) 416
aneurysm of, with erosion of vertebrae, [Kolmer & Mastin] *1290
fragment of bullet on descending, extracted through posterior mediastinum, 44
projectile resting on, extraction of, from rear, [Laurent] (35) 198
AORTITIS, abdominal, graphic sign of, [Mougeot] (49) 1573
APHASIA during typhoid, left-handedness cured following, [Thomas] 481—C
APOMORPHIN and morphin, absorption of, from bladder and urethra, [Macht] (62) 1189, 1232—E
APONEUROSIS, grafted, [Greggio] (52) 575
APOPLEXY: See Brain, Hemorrhage
APPARATUS: See also Instrument
APPARATUS, artificial respirator, [Dudley] *21
combination Finochietto and Steinmann pin traction stirrup, [Hawley] *22
for collecting urine from male infants, [Schloss] *223
for holding foot in flexion and inversion, [Vietor] *678
intratracheal anesthetic machine, [Adson & Little] *1746
siphonage device for chest aspirations, [Felsen] *156
straddle stand for prophylaxis and treatment of sexual infections in army, [Clark] *90
APPEAL board, medical problems connected with draft from standpoint of, [Harris] 806—ab
APPENDECTOMY, prophylactic, through hernial sac, [Norrlin] (104) 498
APPENDICITIS, deceptive cures of, [Diddens] (88) 353
etiology of, [Baird & Baird] 1330—ab
in childhood, [Porter] (48) 345
in gassed, [Moutier] (28) 1505
APPENDIX, distribution of fat in, and relation to inflammation, [Smith] (26) 956
malposition of, unusual case of, [Miller] *23

BLOOD dextrose as affected by morphin and morphin with ether anesthesia, [Ross] (49) 1978
  fat and lipoids of dog before and after production of experimental anemia, [Dubin] (34) 1188
  fatty acids in, in normal and pathologic conditions, [Csonka] (40) 1188
  films, method for decolorizing and staining, [Lacy] 1486—C
  flow, and cold bath, 696—E
  flow, effect of epinephrin on, in muscles, [Gruber] (19) 808
  hemoglobin content of, and red blood cell count in disordered action of heart, [Levy] (14) 59
  hydrogen ions in, in different diseases, [Sonne & Jarløv] (90) 661
  in carbon monoxid poisoning, [Williams] 119—C
  in prematurely born, [Lichtenstein] (135) 1046
  in shock and hemorrhage, alterations in distribution and character of, [Cannon & others] *526
  in typhus, [Danielopolu] (32) 1571
  injection of citrated blood in superior longitudinal sinus in hemorrhagic disease in newborn, [Berghausen] *514
  nomenclature for diseases of, [Bie] (102) 896
  occult, in feces, new method for detection of, [Lyle & Curtman] (57) 417
  occult, test for, [Thévenon & Rolland] (43) 656
  oxygen deficit in venous blood, 696—E
  peripheral, factors concerned in appearance of nucleated red blood corpuscles in, [Drinker & others] (69) 1036
  peripheral, phagocytic mononuclear cell in, simple technic for demonstration of, [McJunkin] (23) 343
  picture in Cubans, [Plasencia] (111) 1045
  plasma, chlorid content of, 852—E
  plasma, proteins of, 389—E
  platelet count of human blood and its vasoconstrictor action after clotting, [Hirose] (22) 1891
  precipitin test for, [Hektoen] *1273
  pressure, [Fulchieiro] (73) 660
  pressure and hemoglobin in postoperative shock, postoperative hemorrhage and postoperative cardiac dilatation, clinical study of, [Polak & Heffter] (119) 959
  pressure and pulse rate as aid in head traumas, [Sieber] (7) 568
  pressure, arterial, in children paralyzed from poliomyelitis, [Souques] (18) 348
  pressure, arterial, record of, [Barré] (44) 1040
  pressure, general, effect of diuretics on, in animals with constriction of renal arteries, [Bridgman & Hirose] (31) 1033
  pressure, high, in sciatica, [Galtior] (32) 349
  pressure, high, in soldiers with heart disease, [Merklen] (20) 348
  pressure, high, in war tachycardia, [Aubertin] (32) 1338
  pressure, high, occurrence of Bence-Jones proteinuria with reference to nephritis and, [Miller & Baetjer] *137
  pressure in gout, [Rosenbloom] *2000
  pressure in head injuries, [Armitage] (133) 654
  pressure in typhus, [Danielopolu & Simici] (36) 961
  pressure in wound conditions, [Fraser & Cowell] *520
  pressure, influence of music on electrocardiograms and, [Hyde & Scalapino] (12) 1566
  pressure, low, administration of epinephrin by intraspinal injections in acute or subchronic cases with, [Auer & Meltzer] *70
  pressure, maximal, palpation for determination of, [Baumann] (61) 200
  pressure, peripheral, in fibrillation of auricles, [Cohn & Lundsgaard] (36) 1259
BLOOD pressure, relation of, to convulsions, [Ervin] *1208
  pressure, study of, by method of Gaertner, especially in fibrillation of auricles, [Cohn & Lundsgaard] (35) 1259
  pressure, venous, simple method for determining, [Brown] (25) 1333
  proteins, studies on, [Meyer & others] (74) 193, (38) 486
  regeneration of, factors in, 1865—E
  regulation of urea excretion by concentration of urea in urine and, [Addis & others] (8) 1566
  reinfusion of extravasated, [Alessandri] (36) 2058
  serum, auto-agglutination in, [Clough & Richter] (24) 1333
  serum, vasoconstrictor action of, experiments on, [Janeway & others] (21) 1891
  substitutes for transfusion after hemorrhage, [Rous & Wilson] *219
  sugar in, in diabetes, effect of diet on, [Mosenthal & others] (27) 343
  sugar in, in diabetes, significance of, 541—E
  sugar in, in infantile beri-beri, [Suzuki] (49) 61
  sugar in, tests for, [Leschly] (111) 1578
  sugar tolerance test, [Janney & Isaacson] *1131
  transfusion after hemorrhage, fluid substitutes for, [Rous & Wilson] *219
  transfusion in anemia, [Ravaut & de Kerdrel] (39) 891
  transfusion in measles, [Ribadeau-Dumas & Brissaud] (23) 1798
  transfusion in war surgery, results of, [Robertson & Watson] (5) 59, (4) 568
  transfusion, modification of Moss method of determining isohemagglutination groups, [Sanford] *1221
  transfusion, new method, [Kreuscher] *223
  transfusion of citrated blood, [Hédon] (34) 1125, [Murard] (70) 1897
  transfusion of citrated blood, simple technic for, [Rieux] (45) 1639
  transfusion, preliminary tests to, [Coca] 1497—ab
  transfusion, rapid macroscopic agglutination test for blood groups and its value in testing donors for transfusion, [Vincent] *1219
  transfusion, selection of suitable donors for, simple and rapid method for, [Lee] (7) 59
  transfusion with tested, grouping of 1,000 bloods and method for use at advanced hospitals, [Karsner] *769
  venous, oxygen unsaturation in, with circulatory disturbances, [Lundsgaard] (75) 652
  vessels, large, in buttocks, exposure of, [Fiolle & Delmas] (57) 577
  vessels, wounds of, 1620
  viscosity of, in relation to heart and kidney disease, [Brandan] (86) 496
  viscosity of, with experimental anemia, [Saneyoshi] (59) 277
  volume, total, in pernicious anemia, [Lindeman] *1292

  lobar, acute, [Shattuck & Lawrence] (37) 809
  lobar, acute, ethylhydrocuprein in, [Moore & Chesney] (26) 1891
  lobar, common colds as possible source of contagion for, [Valentine] (47) 268
  lobar, determination of type of pneumococcus in, [Avery] *17
  lobar, determination of type of pneumococcus in sputum in, [Krumwiede & Valentine] *513
  lobar, partially autolyzed pneumococci in, [Rosenow] *759
  lobar, prophylaxis of, [Kolmer & Steinfield] (75) 957
  lobar, protective inoculation against, 1163—E
  migrating, in children, [Lozano] (88) 1043
  postoperative, bacteriologic study of, [Olmstead] 1496—ab
  prevention and treatment, 382—T
  reaction following antipneumococcic serum, [Friedlander & Runnels] (75) 1189
  special board to investigate, 1607
  streptococcus and pneumococcus groups, [Cumming & others] *1066
  toxicity of pneumonic lungs, [Weiss & others] (36) 1634
PNEUMOPERICARDIUM following paracentesis, report of case, [Stewart] *1222
PNEUMOTHORAX, artificial, [Larralde] (83) 579
  artificial, anatomic effects on lung of, [Burnand] (62) 494
  artificial, improved method for refilling in, [Gammons] *843
  artificial, in bilateral cases of pulmonary tuberculosis, [Gammons] *675
  artificial, in pulmonary tuberculosis, [Morgan] (43) 61
  artificial, in pulmonary tuberculosis, results in private and dispensary practice, [Greer] *1518
  in nontuberculous lung abscess, [Tewksbury] *293
  lung cavity simulating, [Zandren] (97) 662
  spontaneous, double, case of, [Marshak] *1518
PNEUMOTOXIN, skin reaction to, [Weiss] 1496—ab
POLIOMYELITIS, antipoliomyelitic serum in, its protective and curative properties, [Nuzum & Willy] (79) 957
  arterial pressure in children paralyzed from, [Souques] (18) 348
  characteristic sign of, 1916 epidemic of, [Heiman] (23) 55
  comparative study of, [Bristol] (55) 810
  comparative studies of cocci isolated from, [Heist & Cohen] (43) 570
  epidemic, agglutination of pleomorphic streptococcus isolated from, by immune serum, [Rosenow & Gray] (41) 1260
  epidemic, elective localization of streptococci from, [Rosenow & others] (40) 1260
  epidemic, etiology of, [Rosenow & Wheeler] (39) 1260
  epidemic, immune horse serum in 58 cases, [Rosenow] (42) 1260
  experimental, [Kraus & Kantor] (98) 819
  experimental, active immunity in, [Abramson] 1328—ab
  experimental, mitochondria in, [McCann] (48) 268
  hydrocephalus of, [Regan] (2) 1398
  isolation and cultivation of globoid bodies in, [Heist & others] (41) 570, [Smillie] (65) 1036
  microscopic demonstration of cocci in central nervous system in, [Hektoen & others] (84) 193, (48) 486
  operation in selected cases of long standing causes return of power in paralyzed muscles, [Riely] (12) 1633
  opsonic action of poliomyelitic serum on organisms isolated from fatal cases of, [Cohen & Heist] (42) 570
  paralysis left by, [Hoessly] (44) 1404
  Rosenow's antipoliomyelitic serum in, experiments with, [Amoss & Eberson] (82) 652
  second epidemic of, in Sweden, 1911-1913, [Wernstedt] (128) 136
  skin and throat manifestations of, [Regan] (34) 344
  somnolence with, [Tilney] (85) 811
  survival of poliomyelitic virus in brain of rabbit, [Amoss] (73) 1036
  vaccination against experimental, [Abramson] *1142
  work in South Africa, 1319
  work of committee on, 481—ab
POLLEN antigen, antipollen serum for standardization of, [Clock] (46) 486
POLYCYTHEMIA in tuberculosis, [Barlaro] (93) 1044
  vera, roentgen rays and benzene in, [Hurwitz & Falconer] *1143
POLYMYOSITIS, bacteriologic findings in, [Landsteiner] (132) 66
POLYNEURITIS, syphilitic, [Villapadierna] (96) 579
POLYURIA and pituitary body, [Houssay & Romaña] (96) 966, 1321
  control of, in diabetes insipidus by means of hypophysial extract, [Rosenbloom] *1292
POMELO, or grapefruit, 1537—E
PORTO RICO Medical Society, meeting of, 252
  October examination, 875
  roll of honor of, 1320

high, [Cortabarria] (110) 1642
study of, [Legueu & Chabanier] (63) 1574
with asystoly, [Josué & Parturier] (49) 1040
URETER, calculi in, [Martin] (92) 1576
calculi in, high frequency current for extraction of, [Young] (60) 1189
fistula of duodenum and, of spontaneous origin, [Davis] *376
kinking of, intermittent, in child, [Martin-Du Pan] (80) 134
stricture of, [Hunner] (43) 345
supernumerary and single, opening extravesically, [Judd] 415—ab
wounds of kidney and, treatment at front and behind lines, 254
URETEROVENOUS anastomosis, experimental hydronephrosis and blood nitrogen, [Reid] (47) 1035
URETHRA, absorption of drugs and poisons from bladder and, [Macht] (62) 1189
comparative absorbability of local anesthetics from, [Sollmann] (52) 1261
concretions in, large, [Castaño] (82) 424
endo-urethral diathermy, [Roucayrol] (36) 421
filiform structures of, new method of treating, [Buerger] (126) 959
fistulas of, 254
instillations in posterior, modification of Ultzmann's syringe for, [Hinman] *1297
sealing medication in urethral canal, technic for, [Ballenger & Elder] *834

URETHRA, stricture of, military aspect of, [Pasteau] (54) 1506
wounds of, deep, repair of, [Rochet] (69) 1897
URETHRITIS, gonorrheal, treatment of, [Lacombe] (50) 738
URETHROTOMY, external perineal, method of performing, [Barney] (97) 571
URIC ACID: See Acid, Uric
URINARY antisepsis, antiseptic properties and renal excretion of compounds related to phenolsulphonephthalein, [Davis] *581, [Davis & White] (33) 2055
obstruction, median bar excisor for, [Braasch] *758
tract, ascending infections of, [David] (87) 571
tract in pulmonary tuberculosis, [Schapira & others] *591
URINE, amino-acids in, from debilitated infants, [Cannata] (44) 1126
apparatus for collecting urine of male infants, [Schloss] *123
bacteriology of, in children with gastro-intestinal diseases, [Schwartz] (31) 809
chemical changes in blood and, in progressive muscular dystrophy, [McCrudden & Sargent] (41) 650
diagnosis of pregnancy from, [Koopman] (40) 1403
effects of epinephrin on flow of, in anesthetized and unanesthetized dogs, [Gunning] (21) 1332
elimination of diphtheria bacilli in, [Wildhagen] (92) 354
fat in, [Peutz] (123) 1642
findings, record of, [Hollande & Paucot] (41) 737
glucose in, determination of, [Ugdulena] (85) 1802
glucose in, rapid colorimetric method for estimating, [Isaacson] (74) 886
glycuronates in, simple test for, [Askenstedt] (77) 886
hemosiderin granules in cells of, as aid to diagnosis of pernicious anemia and hemochromatosis, [Rous] 1887—ab
in diabetes mellitus and relation of urinary acetone bodies to ammonia excretion, [Richards] (91) 1894
incontinence of, treatment without drugs, 34 recoveries, [Emerson] (4) 1566
influence of pituitary extract on daily output of, [Rees] (16) 1332
iodin reaction of, [Pezzi & Forli] (80) 965
of reptilians, 668—ab
quinin in, test for, [Baur & Reveillet] (52) 1573
regulation of urea excretion by concentration of urea in blood and in, [Addis & others] (8) 1566
salicyl, salicyluric acid in, [Hanzlik] (87) 194
spirochetes in, [Favre & Fiessinger] (36) 131
spirochetes in, with acute nephritis, [Sisto] (87) 64
staining technic, [Minerbi] (89) 818
sugar in normal, method for determination of, [Benedict & Osterberg] (48) 1567
sulphates in, determination of, [Flohr] (86) 353
toxicity of, clinical evaluation of, [Billard & Perrin] (13) 348
urobilin in, test for, [Marcussen & Hansen] (103) 896
UROBILIN and urobilinogen in duodenal contents, estimation of, [Giffin & others] (8) 1498
in urine, test for, [Marcussen & Hansen] (103) 896
UROBILINOGEN and urobilin in duodenal contents, estimation of, [Giffin & others] (8) 1498
UROLOGISTS, aphorisms of, [de Castro] (68) 1128
army, conference of, (60) 1506
UROLOGY and dietetics, relation between, [Lematte] (76) 1268
place of intraspinal therapy in, [Watson] *296
UROTROPIN: See Hexamethylenamin
URTICARIA, causation of angioneurotic edema, eczema and, by proteins other than those derived from food, [Walker] *897
from muscular exertion, [Prins] (57) 2059
URTICARIA, with malaria, [Garin & Pasquier] (27) 273
URUGUAY, National Academy in, 1390
UTAH medical news, 942
state board January report, 1256
state board October examination, 482
UTERUS, cancer of cervix, radium in, at Huntington Hospital, [Risley & Leland] (54) 193
cancer of cervix complicating triplet pregnancy, [Watson] 1916
cancer of, in Cuba, [de Aragon] (58) 277
cervix, amputation of, [de Bengoa] (79) 1268
cervix, bloodless repair of, [Heineberg] (20) 1499
cervix, cauterization treatment of, inflammation of, [Toribio] (89) 424
didelphys, pregnancy in, [Mazzini] (116) 1047
edema of uterine cervix, in pregnancy, [Knoop & van Dongen] (93) 1130
escape of foreign material from uterine cavity into uterine veins, [Sampson] 1885—ab
fibroids of, tendency to become sarcomatous, [Warner] (12) 192
fibromyomas of, roentgen treatment of hemorrhagic metritis and, [Lawrence] (129) 271
gravid, pedunculated myoma on, [Platero] (84) 894
hemorrhage and fibroids, radium in, [Miller] (105) 1636
hemorrhage, roentgen therapy and radium in, [Corscaden] (23) 883
pathologic, at menopause, [Robins] (12) 1033
prolapse and cystocele during child-bearing period, treatment of, [Watkins] (120) 1636
prolapse, new operation for, [Ries] (13) 1792
retrodisplacement of, sterility due to, treatment of, [Dorsett] 1888—ab
rupture of, during labor, causes and treatment of, [Zinke] 266—ab
syphilis of, [Bordarampé] (51) 277
tumor in new-born demanding operation, *report of case*, [Prince] *1212

V

VACCINATION: See also under names of diseases, i. e., Typhoid, Vaccination in
VACCINATION, agglutination method of diagnosis in triple inoculated individuals, [Perry] (55) 1895
significance of immediate reaction *after*, 391—E
successful, study of comparative number of, by cross scarification and incision methods, [Kremers] (62) 1635
VACCINE, autogenous, in enterococcus sepsis, [Langeron] (38) 265
experimental investigation of lipovaccines, [Whitmore & *others*] *427
mixed, not admitted to N. N. R., 1967—P
mixed triple, superiority of inoculations with, (B. typhosus, B. paratyphosus A and B. paratyphosus B), [Davison] (14) 1398
sensitized, in prophylactic treatment of infections, [Cecil] (6) 2053
virus, 1227
virus, brilliant green as bactericidal agent for purification of, [Krumwiede & others] (34) 570
virus, pure, cultivated in vivo, *properties of*, [*Noguchi*] (72) 1036
VACCINE THERAPY: See also under names of Diseases
VACCINE THERAPY, bacterial, in prostatic cases, [Bumpus] *213
fundamentals of, [Holland] (92) 733
VAGINA, *absorption of drugs and* poisons through, [Macht] (50) 732
absorption through, 1538—E
artificial, [Abbott] 341—ab
douching of, [Fothergill] (1) 1795
drainage in pelvic cases, [Hinchey] 1888—ab
VAGOTONY with gastric ulcer, [Ayres] (55) 1127
VARICELLA: See Chickenpox
VARICOCELE, warning against operations for, on applicants for enlistment, [Bloodgood] 409—C
VARICOSE VEINS, *operative treatment* of, [Guaccero] (54) 1984
spiral incision treatment of, [Hoogveld] (95) 497
surgical treatment of, [Anderson] 1331—ab
VARIOLA: See Smallpox
VASOCONSTRICTOR action after clotting and platelet count of human blood, [Hirose] (22) 1891
action *of blood serum*, experiments on, [Janeway & others] (21) 1891
VASODILATOR reactions, [Hunt] (14) 808
VASO-EPIDIDYMOSTOMY *for* obstructive sterility in male, [Lespinasse] *118
VEGETABLES, dehydrated, [Givens] *1713, 1766—E
powder as larvicide in *flight* against mosquitoes, [Thibault] *1215
VENA CAVA, superior, obliteration of, [Favre] (55) 1267
VENCALNODINE, 481
VENEREAL DISEASES, [Hume] 338—C
act, prosecution for quackery under, 1551
and matrimony, [Orfila] (84) 661
campaign against, 170, 1020
clinics for, 1245
control of, in Massachusetts, 1234
discussion of, 475
discussion of, in German Senate, 1875
evening consultations for, 1554
in army, a suggestion, [Belfield] 1324—C
in army, control of, [Woodbury] 1970—C
in Ontario, 252
in Spain, repression of, 1482
incidence of, 1166
inquiry into feeble-mindedness and, 252
legislation, 332
moral welfare of military establishments to be further safeguarded, 1770
moving picture entitled "Fit to Fight," 1166
prevention of, most effective methods of, [Baldy] 1975—ab
problem in California, [Irvine] *150
prophylactic treatment in prevention of, [Thrush] *1922
prophylaxis of, [Bourdinière] (69) 1195
proposed federal control of, 1771
public warning against, in Netherlands, 1875
straddle stand for prophylaxis and treatment of, in Army, [Clark] *90
treatment of, 1181
VENOSAL, 48—P
VERATRUM, clinical actions of, [Collins & Hanzlik] (93) 887
VERMIN, sulphuration treatment of, 476
VERMONT medical news, 1244
state board February examination, 1397
VERONAL and novocain to be manufactured in United States, 43
classed as poison by England, 953
VERRUCA, 232—T
VERTEBRAE, cervical, dislocation of, [Speed] (44) 192
method of draining bodies of, [Mayer] *593
VICK'S Vap-O-Rub, 1024—P
VINCENT'S angina, [*Deglos*] (51) 962
boric acid-hypochlorite mixture, antiseptic power of, 1320
VIRGINIA medical news, 252, 552, 638, 942, 1179, 1389, 1481
VIRILISM, suprarenal, in woman with hypernephroma, [Guemes] (75) 353
VISCERA, syphilis of, in young infants, [Menabuoni] (72) 1268
VISION, acuteness of, test of, 259
and equilibration, [Fisher & Lewis] 1625—C
binocular, "hole in the hand" test for, [Cantonnet] (39) 422
VITAMINS, [Madsen] (58) 2060
and bacteria, 1164—E
antiberiberi, location of, in germ rather than in pericarp of grain, 1000—E
behavior of, 1005—E
in diet, [Pittaluga] (62) 1128
stability of, 1230—E
VOMITING of pregnancy, feeding in, [Bacon] *1750
VOMITING *of pregnancy*, serotherapy for, [Melgar] (45) 2059
paroxysmal, with inherited syphilis, [Barbier] (29) 1798
repeated, cause of hemorrhagic erosion of stomach, [Murata & Hashimoto] (11) 348
VULVA, unusual ulcerative process of, [Schiller] (7) 1118

AUTHOR INDEX

In this Index are the names of the authors of articles which have appeared in The Journal, the names of those who have read papers before Societies as published in The Journal and those whose articles have been abstracted in the Current Medical Literature Department. The * preceding the page reference indicates that the article appeared in full in The Journal. The number in parentheses indicates the numbered paragraph on the page referred to. The numbers not in parentheses indicate pages. The author's name is followed by a brief clue to the subject of the article in brackets.
